THE BUILDER

A JOURNAL FOR THE ARCHITECT AND CONSTRUCTOR.

WITH WHICH IS INCORPORATED "THE BRITISH ARCHITECT."

VOL. CXXV.—No. 4202. AUGUST 17, 1923

THE SUPERSTITION OF THE PAST.

EVERYTHING which, in the study of the past, can inspire us to emulate its most noble achievements is desirable, and we can, therefore, hardly overestimate the claims upon us to preserve our national inheritance without needless violence being shown towards it; for great harm was done during the last century through ignorantly conceived restoration, and even from sheer vandalism. But if we have escaped these dangers, we must also beware lest we fall into others, one of which is the making a superstition of the past. Withdrawn from all the strife which the competition for livelihood and opposing aims sets up amid contemporary effort, the past rests in a twilight of its own, tranquil and consoling no doubt, but it is not, therefore, surprising if it exercises over us a strange fascination, so that to wander through some cathedral cloister or ancient Cotswold town leads us to invest the whole surroundings with a beauty and romance wholly undisturbed by the contending currents of our own time. It is a resting-place as well as background for our thoughts, and a dream of beauty to our eyes. All this is well, and to be valued, like the reverence for old age, ennobling to the self-respect of a nation reared on such a tradition. Nor is the influence only direct, for, in the case of architecture particularly, it is surrounded with the rich embroidery which nature and time have contributed to it, so that it is presented to us framed in a golden imagery of its own. We can claim no like advantage for our own time and work, which is moored in no such tranquil harbour and forges itself in the fierce heat of contemporary criticism and the struggle for livelihood. We accept the past in quite another way; it is much easier to be just to it. We may vary in our appreciation, but personal feeling hardly enters to disturb our judgment. Unfortunately, we can claim no such detachment in judging of our own work. It is this fact which should make us careful to sustain an open and generous attitude towards contemporary achievement, in that it is so much more difficult to be just to it. The problems which beset the mediæval craftsman are too far off to agitate us now, and we ought not to form unfavourable comparisons between past and present just because of this, or depreciate modern effort. This self-respect, the need to do justice to our own time, and show tenderness to failure, is its due. And when we hear unfavourable comparisons made between our own and mediæval craftsmanship, are we always just to our own?

Those no doubt preoccupied with the craze for antiques will refuse to believe that we have craftsmen working to-day whose work offers favourable comparison with the best work of the past, but are such eyes open to the virtues of our own time? We think, on the contrary, that we suffer from much ignorant disparagement of contemporary work, which is most unfortunate in its influence. It is very slender evidence of taste to accumulate "old masters," and proclaim that we never purchase modern examples, as though to infer that the former were invariably intrinsically valuable—which they are not; and there is often more snobbery than discernment in cramming our home with "antiques." We recall an instance of the kind in the case of a visitor at the house of a wealthy man, who, admiring a piece of pottery in one of the cabinets, was told by his host that he knew nothing about it—the pottery being there merely because he had told his dealer to fill his shelves! The industrial age no doubt brought many evils in its train, and perhaps the most alarming is that it has led us to doubt ourselves. We flee from the present as some manufacturers flee from their factories, making their home far away from the locality which their occupation has defiled. But while all this may be granted, it would lead us to very false conclusions if we thought it the whole story. That the prevailing evil of too much self-seeking should distort the picture for us is only to be expected, but everyone is not tainted with "commercialism," neither is there any quarrel with commerce rightly conducted and producing necessary things, for we all depend on it, and a too indiscriminate condemnation leads us into error. For the good is with us, too; and in the matter of craftsmanship, were we to exercise a more generous judgment, we should find much of beauty in our own time we had not discovered before. Instead of pursuing the path of the dilletante, a better citizenship admonishes us to seek out and encourage the good in our own time on which we and the future so much depend. We need to discredit the superstition which makes an idol of the past, one we ignorantly worship. Many are familiar with the levity which finds no inconsistency in putting up the vilest window in an ancient church, at the same time professing a most bat-eyed adoration for its ancient features.

A thing is not good because it is old, however, but because it is good; and it is no true respect for the past which leads us to think meanly of ourselves. The architect is, we think, sometimes at fault when, having built a good house for his client, instead of directing him to the good work of our own craftsmen he ransacks the antique shops to furnish it with old pieces. It was stated to us by a rich man that he preferred to spend his money in philanthropic ways because there was so much division as to what was bad or good in modern art, so that he felt his money was more securely spent in giving it to charity. It is no objection to philanthropic enterprise which compels us to criticise so short-sighted a view. Was it not his obligation to distinguish himself between what was good or bad in art? Surely a better citizenship required that he should form a sound judgment. Besides, that desire to be secure, to protect oneself in such a way, has nothing admirable in it, and he ought no longer to get off on such an excuse.

Better men have more real respect for the past, and act more like it, when they live in their own time and through it, instead of turning their eyes away. It is much easier to recognise value when it has been already recognised for us, easy enough to admire what all are admiring. But to form our own independent appreciations and to have the true culture that enables us to form them rightly is not so easy. To seek out and make opportunity for the vital craftsmanship of our own time asks a finer courage and discernment than any included in merely stuffing our house with "antiques"; and it appears to us that the time is coming when this better leadership will be recognised as such and bring us more prestige, because it includes not only truer discernment but better citizenship as well. We need to bring our appreciations nearer to reality, and in doing so we shall perceive the evils of dilletantism and unreality. It is impossible to disregard those symptoms which imperil the prospects for art; the capture of architecture by the salesman, its inevitable disintegration under commercial exploitation, the replacing of vital craftsmanship more and more by standardisation—all this should teach us that a dilletantism preoccupied with the past and living in a vain show of false culture is not the direction through which to cure present evils. For it is example, leadership, that is wanted. Let us not be too ready to blame our time or think meanly of it, for we are all part of it, and the physician must heal himself. The superstition of the past is no alternative for confidence in the present; nor is it a genuine understanding of what the work of the past should mean to us if it only lessens that confidence. For it suggests that we neither understand the past nor ourselves. In the end we best encourage art not through the dead but the living. He who has created opportunity for one good piece of work now is a greater benefactor than if he had filled his house with antiques. It is in this better understanding of ourselves that we shall rightly apportion what we owe to the past, while at the same time perceiving that we owe to our own time much more. In this better atmosphere results will grow, as most things accommodate themselves to good will. A household is not kept together by either distrust or sermons, but by the prevailing large-heartedness and understanding which governs it. We have little use now for those whose admirations reach no further than "period" furniture and antique surroundings, always looking backward and caricaturing the past. From such poor reverence we may well escape. Let us rather be in the van, for true leadership is what really matters. Thus, in the words of a master-poet, we may "Strike up for a new world," leaving the dead past to bury its own dead.

NOTES.

Assessments. The recent agitation against the new assessments of houses for income-tax has been fairly met by the concessions the Government has made. The increased allowance for repairs and the reductions in the inhabited house duty were, we think, wise concessions to make. All through the controversy we noted the tendency in the Press to discuss the matter solely from the householder's point of view, in the sense that the additional tax was an added burden to the already heavy taxation. We did not subscribe to the indiscriminate agitation in the belief that the additional tax was unfair; we maintained that it was unreasonable to grant subsidies to encourage the building of houses and then to proceed to neutralise the whole principle by increasing the responsibilities of the building owner. It was wholly a question of whether we wanted revenue or houses; the financial side was merely a matter of book-keeping, as in the end the Government is forced to stimulate the supply of houses.

Taxation. We have frequently stated that the principle of taxation and rating of houses is fundamentally wrong. The question of housing is one which directly affects the health and happiness of a nation, yet we place a heavy burden of taxation upon our buildings such as we would not dream of putting upon any other useful commodity. The reply would probably be that it is because houses are so essential that they form the most convenient and equitable basis for taxation purposes. It is obvious that there must be limits, and those who are interested in the social development of a nation may be able to indicate the point when it assumes a *non possumus* attitude towards its obligations and responsibilities and spends its money as it pleases. It may be that the battle of paying our way is quite sufficient for the moment, and that we can listen to discussions upon the proper disposal of our surplus income with academic detachment.

Main Roads into London. From the interesting paper on "London's New Trunk Roads in the Making," by Mr. C. H. Bressey, we note the author's confident belief that Londoners can be relied on to see to it that the greatest city of the world is approached by highways worthy of London's noble history and nobler destiny, though some may remain incomplete for a considerable period. He says: "Even our quick-witted Parisian friends have to tolerate some degree of delay in such matters, and I was consoled to read a month ago that the completion of the Boulevard Haussman, which was begun in 1857, is now being seriously taken in hand." Those who have travelled much by road and experienced the awkwardness and delay in passing through congested traffic like that in Exeter or Croydon, will realise the advantages which are coming from by-pass roads, such as that at Croydon. This enables motorists to swerve from the London-Croydon main road at Thornton Heath, leave Croydon with its trams, 'buses and shopping centres on the left, and follow for four miles the wide new unobstructed highway saving in distance as well as in speed of travel.

The Western Doorway, Southwell Cathedral.
[This Norman doorway is reputed to have been built about the year 1110.]

A National War Memorial. In regard to the proposal for a national war memorial, to which we made reference last week, we thought the occasion to be commemorated too great to be mixed up with a scheme, however commendable, for providing a new road bridge across the Thames at Charing Cross. That we should bring the right spirit to such a commemoration, on which perhaps the very existence of Europe in the future depends, appears to us of paramount importance. The Charing Cross scheme has received too large a measure of representative approval to require hoisting on the shoulders of another object, with which it cannot in any way be considered to be closely related. The Honorary Secretary of the London Society, writing in a contemporary, states that the London Society is "in entire sympathy with the suggestion," i.e., of mixing the two together; but we think it more to the advantage of the much-needed London improvement to rest it on its own merits, and when the occasion comes for a National War Memorial to rest that on its own also. It may be that our own time is better spent in laying the foundations of a better future, out of which such monuments may grow, than in finding there so easy to talk about just now.

The Cardinal's Lodgings. The opening to the public of the three rooms in Hampton Court Palace known as "My Lorde Cardinall's Lodgynges," is an event of very considerable interest. Allotted to private occupation by favour of the Crown, but little attention hitherto has been given to the historical and archæological interest. An opportunity, however, occurring when the rooms were lying vacant, the Office of Works made investigations which revealed that the modern battening and papered canvas covering the walls concealed a great quantity of fine old "linenfold" panelling, the ceilings also displaying the badges and cognisances of the Cardinal himself. Other discoveries have since been made, and the rooms, now in order for public inspection, show

"The Three Mills."
By Mr. Hesketh Hubbard, R.O.I., A.R.W.A.
(*See p.* 257.)

prove of great interest to the many thousands of people who visit Hampton Court—but surely the Office of Works has been ill advised in making a charge for admission? In regard to the more complete restoration of the rooms and the renewing of the ceilings, something may be said on both sides. To have the ceilings, as a contemporary suggests, "decked again in their old colours," is not an easy task, unless under very sympathetic treatment, and the matter should be weighed very carefully before tampering with the original work.

Pictures for the National Gallery. The offer of the sum of £50,000 by Mr. Samuel Courtauld, accepted by the Board of the National Gallery, Millbank, for the purchase of modern foreign pictures which the nation might not otherwise easily acquire, will be welcomed by many people. Purchases, it is said, are to be limited "to the works of a definite list of painters centering round the great Frenchmen of the latter half of the nineteenth century." On the question of the "greatness" of some of these painters opinion is still divided. Much will depend on the choice which is made, as the work of members of this school is often very unequal, and it is pointed out in a contemporary, with some truth, that "it is one thing for the National Gallery to accept certain definite pictures offered or bequeathed by private individuals, and quite another for the Gallery to agree in advance to spend a sum of money on the purchase of unspecified pictures of one or two specified schools." The National Gallery is therefore involved in a somewhat undetermined responsibility, and there is the feeling that the gift would have been better bestowed had not the donor proposed to force his own particular appreciations on the nation. We are not disposed to challenge the claims of these schools to representation—far from it; but the final estimate of the permanent value of the contribution to art of some of these painters is not yet determined.

The Placing of Sculpture. Messrs. Helmle & Corbett, the Bush Building Co.'s architects, are leaving nothing to chance regarding the placing of the figure compositions in the great arch over the main entrance of this new building. They have recently experimented with full-size photographic enlargements of the compositions, which effectively show the pattern or silhouette of the proposals and allow a good judgment to be formed as to what the foreshortenings amount to from the eye-level whilst coming down Kingsway. We do not remember having seen such things attempted in this country before, the usual methods being too often haphazard. Much figure work on our modern buildings is ill-placed and shows a lack of mature thought, especially regarding the level from which it will be viewed. Interest will centre on the result of Messrs. Helmle & Corbett's experiments.

Student-Miner's Success. At the Welsh National Eisteddfod, held at Mold, the prize for architectural design was awarded to Mr. David J. Williams, a student in the School of Architecture at the Technical College, Cardiff. The subject for the design was an entrance archway in stone with iron gates suitable for a memorial recreation ground. Mr. Williams' success is particularly praiseworthy in that he has studied under considerable disadvantage, inasmuch as during the early part of his course in architecture he continued his regular work in a coal mine.

Hours of Labour. Coming from such a keen social reformer, and one with such well-known sympathies with labour, as Mr. Seebohm Rowntree, some statements in an address he gave at the annual congress of the Royal Sanitary Institute at Hull are of particular interest to the building trade. After expressing the view that a wage sufficient to maintain a reasonable standard of comfort, reasonable hours of work, reasonable security during the whole of life, a reasonable share in determining the conditions of labour, and an interest in the prosperity of the industry, were essentials which every industry should provide for its workers, he said a working week of forty-eight hours had proved to be a satisfactory general standard, and any deviation from it, either up *or down*, should be justified by special circumstances. With the means of production at present in use it can hardly be expected that the benefits which Mr. Rowntree lays down as essential to a contented working-class population can be secured for less than forty-eight hours of work each week.

Trade Union Discord. A statement by a correspondent of *The Times* last week contains much food for thought. Signing himself "Architect," he instanced an important building work in the North of England on which stone was required from the Midlands. It appears from the letter that the quarry owners in the Midlands were paying their men the local trade union rates, but the operatives on the building declined to handle the stone and threatened to strike unless the quarrymen in the Midlands were paid the northern rate. The dockers have struck against their own leaders, and now apparently one trade union is threatening to strike against another. If the trade of the country is to be hampered by the internal discords of the trade unions as well as by their disagreements with employers, it is difficult to conjecture how the unemployment which is, unfortunately, now o such large proportions can be lessened.

Gateway at Stoneleigh Abbey.
[This gateway, which is still in much the same condition as when built, now gives access to the residence of Lord Leigh, near Kenilworth.]

GENERAL NEWS.

Professional Appointment.

Mr. Reed Edwards, surveyor, Haverfordwest, has been appointed Surveyor to Goodwick (Pembroke) U.D.C. There were 28 applicants for the post.

Proposed New Road to London Docks.

The London Chamber of Commerce has decided to urge the Government to consider the question of constructing a new arterial road to the London Docks. The question of the making of the proposed thoroughfare, which it is suggested should run through the heart of London to Tilbury, has already been brought to the notice of the Government, who, it is understood, are reluctant to make a move in the matter because it would involve the demolition of a large number of dwelling houses, particularly of the smaller type, at a time when the housing shortage is so acute.

St. John's Church Alley, Norwich. From a drawing by Mr. George J. Skipper, F.R.I.B.A.

[This building was apparently part of a clergy house, attached either to the Duke of Norfolk's palace or the Church whose tower buttresses jut into this building. The small, moulded brick doorway was revealed, as also were the remains of the ground floor window, and two doorways and windows on the street front (not shown in the drawing), where the old stucco was stripped off the walls. These features were not known until the work of repairing the roof—with which the work started—was well advanced. The building had been used as a second-hand furniture stores, and was very dilapidated before it was repaired].

Nos. 210–216, Old-street, E.C.

With reference to our illustrations of 210–216, Old-street, E.C., last week, the quantity surveyor was Mr. George Spencer, F.S.I., F.I.A., of 79, Gresham-street, E.C.2.

New Church at Freshwater.

The Roman Catholic Bishop of Portsmouth last week dedicated a new church at Freshwater, Isle of Wight, erected and endowed by the bequest of the late Mr. Edmund Granville Ward. The new church is designed in the Italian Romanesque style, and is constructed entirely of brickwork specially made in the Isle of Wight.

Canada's Pavilion at Wembley.

There is stated to be keen rivalry among the Dominion representatives who are arranging the construction of their various national buildings in the grounds of the British Empire Exhibition at Wembley. Canadian workmen are making good progress in the construction of the pavilion which will represent that Dominion. The main building, neo-Greek in design, covers an area of 120,000 sq. ft., with a frontage of 415 ft. facing the artificial lake running east to west the full width of the Exhibition grounds.

Taxation of Land Values.

The International Conference on the Taxation of Land Values, at which delegates from fourteen countries were represented, formally began its sittings in the Municipal Buildings, Oxford, this week. Mr. C. E. Crompton, in his presidential address, urged that the tenure of land was the great governing factor which ultimately determined the economic, political, and, consequently, the intellectual and moral condition of a people. The more completely land was monopolised the greater was the insecurity of employment. He advocated that the equal right to land be established and the full fruits of industry be secured to industry; that to attain this end in the simplest, easiest, and most practical way public revenues be obtained by imposing taxation on the value of land apart from improvements due to private enterprise; and that taxation on land value be payable by each person interested in the value of the land and in proportion to his interest. The complete taxation of land value, he said, would provide such public revenue as would render all tariffs and restrictive taxes unnecessary, and would give the world freedom of trade and remove the main causes of international strife.

COMPETITION NEWS.

St. Stephen's Church Hall and Institute, Bush Hill Park, N.

The design placed first in this competition, held recently, was that of Messrs. George Baines & Son, F.R.I.B.A., F.S.Arc., 121, Victoria-street, Westminster, S.W.

Halifax.

For the Corporation.—Plans and report for lay-out of Bull Green site and part of centre of the town adjoining. Premium, £50. Sending-in day, October 1. Banned by R.I.B.A.

Ellesmere-street Wesleyan New Church and Schools, Warrington.

The Committee has extended the date of delivery of plans in this competition from August 8 to August 15. Banned by R.I.B.A.

Other Competitions.

Other competitions still open include the following (the dates given are, first the sending-in date, and second the issue of *The Builder* in which full particulars were given):—Singapore College (Jan. 1, 1924; March 30). Greenwich Baths (Aug. 25; May 4). Hull Art Gallery (Nov. 5; May 4). Mint competition for plaques (Sept. 30; May 25). Birmingham Masonic Temple (Sept. 12; June 22). Colour scheme (Sept. 30; June 29); Memorials to the Missing (Jan. 1, 1924; Aug. 3).

CORRESPONDENCE.

[While we are glad to publish letters on professional and other matters of interest to our readers, it must be understood that we do not necessarily endorse the remarks of correspondents, who will oblige us if they will express their views as briefly as possible.]

Tunbridge Wells Pavilion Competition.

Sir,—The present generation of architects who spend laborious days and nights (chiefly nights, *vide* "Jacob Stahl,") on competitive work, appear to be obsessed with the "heavy monumental type" of building. As you have timely observed, they display, in consequence, "a lack of sympathy or imagination." There is no doubt that recent illustrations furnish ample evidence in support of your observations. Long ago I came to the conclusion that the phrase, drummed into me in my early years, viz., "the plan is the thing," was given undue importance. The assessor in the above competition was, apparently, similarly influenced and, even now, cannot resist the temptation of passing it on. He writes: "The plan is economical and well arranged, and there is no wasted space." The plan, of course, is important; but, in my judgment, unless the roofing receives as much attention, such schemes as the one at Tunbridge Wells will continue to merit, relatively, the observations you have passed upon them. What is the cause of the trouble? My submission is that architects in general will not, or cannot, escape from that arrangement of their forefathers (unfortunately pandered to by all the manufacturers of cheap steel trusses), viz., that principals must be 10 or 12 ft. apart. Our predecessors, when using wood, were justified; but can the same be said to-day when we have at hand a material capable of performing greater service? (*Note.*—The premiated Tunbridge schemes: Steel trusses, 10 or 12 ft. apart, and covered up. Why not 20 or 25 ft. apart?) Play can then be made with lunettes and light intermediate areas, instead of heavy brickwork, small windows, "unpleasing parapets," and generally uninteresting side elevations. The assessor nearly stumbled on the truth when he said that "the upper windows might be larger, but that is a detail!" Not a word about the disposition of the principals! Increasing the size of the windows, when the principals are approximately 10 ft. apart, will not prevent the "elevations being austere," and certainly will not create the effect suggested as required in your article. What is really necessary is to reduce the points of support, and then sympathy and imagination will get their chance.

Apart from the "monumental" aspect, permit me to direct your attention to the section of the end gallery (Schemes 1 and 2). Why broken backs? What are sight lines for? To remedy this defect in Scheme No. 1 the roofing (flat) will have to be raised 3 to 4 ft. (Missing cube over 3,000 ft.). The seating arrangements (Schemes 1 and 2) may, in the county of Kent, be considered satisfactory; in London or Essex, distinctly, "No. A" licence for music could not be obtained. Scheme 3, in this respect, is excellent.

Walthamstow. J. Williams Dunford.

Sir,—One of the Conditions of the competition for the Tunbridge Wells Pavilion reads:—"The drawings are to be in ink, on double elephant sheets of drawing paper, except the perspective drawing, which is to be on a half double elephant sheet, mounted on strainers, in black line with sectional parts blocked in." Furthermore, answers to competitors' questions made it quite clear that competitors were not permitted to present any of their drawings rendered in wash. Yet the premiums are awarded to those who ignored these conditions, and the conscientious competitor unwittingly handicaps himself in presenting his scheme in line drawings as specified without availing himself of the undoubted advantages of indicating the materials of construction through the medium of colour.

One of the principal objects of the conditions of competitions is presumably to form a common basis for the purpose of comparison of schemes, and one would expect that competitors not complying with such conditions would be disqualified—certainly not awarded the premiums, as in this case.

Again, the Conditions state that the "Perspective view is to be taken from about the point marked 'A' on the block plan." In the first premiated design the perspective is plotted from the air, presumably to obtain a better effect. Surely some explanation is due to the other competitors who complied with the letter of the Conditions.

All premiated designs show a band stand "arranged for either an inside or outside audience," but half of the inside audience have their backs to the band. We fail to see how it can be inferred from the Conditions that a re-arrangement of the seating on each change of weather was contemplated.

As we are competitors who actually received a letter from the promoters of the scheme, in reply to a question, to the effect that "Drawings are not to be coloured," we feel that we are singled out for handicap, and we shall be glad, therefore, if you will kindly give publicity to this protest.

We can only hope that competitions in future will be run on more satisfactory lines.

"Competitors."

Sir,—All hail to your readers who desire to see a drastic revision in the conduct of architectural competitions. After the Tunbridge Wells and Bournemouth failures the R.I.B.A. would be well advised to establish a system which would avoid the giving of prizes for inefficiency.

It is a pity to see architects designing balconies in which 40 per cent. of the seats give no proper view of the stage (a very sad thing for the promoters), and it is surely a scandal that assessors should award premiums for such designs.

Robert Cromie.

London.

Clerks and Artists.

Sir,—Passing by the personal remarks about conjuring with rabbits, &c., and condensing the rest to try to get the meaning clear, I understand Mr. Maxwell Aylwin to say: (1) Style designing is not now in fashion; (2) The free artist is as much out of the scheme of things as the free "Tommy"; (3) The architect should be encouraged to get on with his job.

(1) I should be glad to think so, but I don't; rather I see a tendency to pile on more, or other, style features, and then to pretend that the composition is just "architecture"—much as the Prussian rulers piled up frightfulness and called it culture.

(2) I welcome this clear statement, and think it right to suggest that we should modify our martial-law kind of architectural commands and save some percentage of the "decorations" (?) for free artists.

(3) Is the architect's job structural perfection or "scholarly individuality" in design? I have wished to encourage architects to concentrate on the former view of their job and to get on with it quickly. W. R. Lethaby.

Architecture and Commerce.

Sir,—I have read your article in last week's *Builder* with interest. As a genuine expression of opinion I accept the trend of its thought with an equal mind, but I venture to suggest the following to your readers:—

It is obvious that any state of civilisation must base itself first on the necessities of life, *i.e.*, food, clothing, shelter, for all. The superstructure which is built upon this base can never be anything but a reflection of the desires of the people after the necessities of life have been provided.

Granted that the present order provides every individual with the necessities of life—which it does not—what are we to say is the quality of our desires as reflected in the superstructure? We can only say, and this with perfect justice, that modern world commerce is almost entirely occupied in catering for our lower or corporeal natures. The desires of the body are the lowest known to philosophy. Out of this low general state of desire no general beauty can ever come, and that which is occupied in supplying these lower desires, whether we call it commerce, trade, industry, or what not, can never be whitewashed even by the most sublime genuis ever born.

W. W. Scott-Moncrieff.

London, S.W.

Office of Works Appointments.

Sir,—Under the heading "Office of Works Appointments," which appeared in your issue dated August 3, there was an important slip in the third column. In describing one of the four cases to which the Institution of Professional Civil Servants took strong exception, the article stated that the official in question was going back to a post senior to many posts held by men formerly his "juniors"—the word should have been "seniors." The answer given in the House of Commons on July 31 to Mr. G. Jones (*Hansard*, No. 108, Vol. 167, col. 1294), who asked a further question on the same subject, was very unsatisfactory, for it merely catalogued the qualifications possessed by any moderately qualified assistant architect in the Office of Works. Most of them are much better qualified. There was nothing exceptional in the qualifications of the official whom it was proposed to treat in so exceptional a manner.

H. E. Weaver,
Secretary.

Institution of Professional Civil Servants.

Work for "Unemployment."

Sir,—My reference in your last issue to the possibility of commencing the immediate construction of the connecting link in the Green Park between the northern and southern sections of the suggested mid-metropolitan artery on the score of "unemployment," prompts me to further explanation.

Proposed originally in following up the recommendations of the Royal Commission on London Traffic for the widening of Berkeley-street now that the Devonshire House site is to be built on, further investigation has shown that there are three or four alternatives northwards. Any one of those might be adopted, the question being as regards the most suitable in the problem.

An outer traffic ring would be added to "Regal Circle" with two levels, the lower passing under the Mall and the other outlets, existing or projected. As pointed out last week, apart from the main question, there is the pressing necessity of more direct cross-communication facilities for traffic midway between Whitehall and Hyde Park Corner, a distance of over a mile, which must be conceded sooner or later. In the adoption of an outer ring, which would mean the diversion thereto of all through traffic, the immediate vicinity of the Palace itself would benefit in the quieter atmosphere produced, only traffic for the Palace being admitted.

The predominating sombre traffic surface might then be replaced by the verdant parterre, resplendent with floral beauty, to an enhancement of the aspect in general.

"O.B.I.T."

London.

[Other letters are given on pp. 254, 262 and 269.]

Demand for Corporation Houses.

Thousands of men, women, and children it is reported, went to the Manchester Town Hall last week to apply for 690 houses, the erection of which has just begun. The houses are being built for £425 each, against £1,100 paid for similar houses when prices were higher. Many people walked from the suburbs, and a queue had formed by six o'clock.

THE BANK OF ENGLAND.

HOW IT WAS BUILT, THE MEN WHO WORKED UPON IT, AND WHAT IT COST (1788-1833).

BY ARTHUR T. BOLTON, F.S.A., F.R.I.B.A., *Curator of the Sir John Soane Museum.*

THERE is a well-known story which tells how Louis XIV, on receiving the building accounts of the Palace of Versailles, promptly burnt them, so that no one but himself should ever know what had been the disastrous cost of his great white elephant. Had Sir John Soane, at his resignation on October 16, 1833, presented the 14 small folio volumes of fair copies of "The Tradesmen's bills for the Bank," covering the 45 years of his stewardship, now in his Museum, and stated the total as well under a million, the Directors, having in mind the recent scandal of Buckingham Palace under Nash, might well have been incredulous.

Included in this total are the five houses in Princes-street, known as New Bank Buildings, and the National Debt Redemption Office in the Old Jewry, both now destroyed. The cost of the Bank is apparently nowhere stated, nor would it be possible to say what, as a building, it did cost, for the table of annual outlay, which is given in this article, includes every conceivable item, such as ordinary maintenance charges, down even to window cleaning, lay out and upkeep of the garden, furniture, bedding, curtains, carpets, counters, desks, stools and chairs, beer and medical aid for workmen, even the national illuminations, &c., all of which would never in the ordinary way appear in such a calculation. Soane, as architect to the Bank, becomes the universal provider to the vast establishment, and his red ink deductions pursue every tradesman with the keenness of a Treasury official of the Gladstonian epoch. The Bank accounts are a picture of the period 1788–1833, the cost rises with war freights and King's duties, the Continental blockade troubles Soane with inquiries into the real value of Memel and Dantzic timbers, and, after Waterloo, we see the same fall in values and wages that we anticipate so eagerly to-day. There is a significant Note that "since 1804 old stone, old bricks, &c., have been used."

There was no organising contractor who built the Bank. It was the work of a group of tradesmen controlled by the architect and his clerk of works. This method of building secured the high level of workmanship to which the durability of the Bank is a witness. It does not lend itself to an exact determination now of what was done in a particular year, because it is only rarely that the place, or the work, is defined. It was obvious at the time, but the identification now would probably be beyond the powers of the most experienced surveyor. It was a peculiarity of Soane, as an architect, to act as his own surveyor, and he prided himself on making no extra charge. He is simply paid the usual five per cent. on the half-yearly totals, except on a very few occasions, when some very special service is rendered, as, for instance, the laying out of the Princes-street and Lothbury extensions, with all the Committee work in Parliament, in the City, and the negotiations with the Grocers' Company, &c., involved, on which occasion he makes a special charge of £200 for invaluable services. The accounts are made up quarterly by himself, abstracted in two columns, of one quarter each, giving the half-yearly total, and with this he renders his statement of charges as follows:—

"The Honble. Governor, Deputy Governor, and Directors of the Bank of England.

To John Soane.

(from Lady Day to Michaelmas 1791.)			
Commission on the Bills for work done as per abstract . . . . amounting to £5,471 3s. 6d. at 5 pr. cent.	£273	11	2
Clerk of the Works, 161 days from the 25 March, 1791, to 29 September, 1791, included	40	5	0
	£313	16	2"

The form does not vary, as the last, in 1833, is made out in exactly the same way. The date of the last payment made to him was April, 1834, being for the account to October 16, 1833, the date of his resignation. The clerk of works was, I think, the same all through, Walter Payne. He was at first paid £78 a year, £100 in 1800, and £165 from 1812 onwards. In Sir John Soane's will (May, 1833) £150 a year is left to "Walter Payne, my present Clerk of Works at the Bank, and his wife, for their lives." He is also, with five others of the office, to share the stock of red wines and spirits in Soane's cellars at the time of his death. The following list gives the names of those worthy to be recorded for their achievements:—

Schedule of the principal tradesmen* employed on the Bank from 1788 to 1833:—

Masons.—Henry Parrell and Jas. Nelson, both from 1788; Nelson and Grundy, 1807; Thos. Grundy, from 1810.

Bricklayer.—Thos. Poynder, from 1788.

Carpenters.—Wm. Collcott and James Swinton, both from 1788; Swinton and Martyr, Richard Martyr.

Plasterers.—Thos. Palmer, John Bayley (d. 1812).

Painter.—Hannah Rowe, from 1788; John Crace (1794) and Wm. Watson (1810)

Glazier.—James Curtis, from 1788.

Coppersmith.—Samuel Rehe.

Stove-makers.—Alex. Brodie, Jas. Lukin & Co., Aug. Ramellie (1793, serpent in Bank Stock office cellar), John Skidmore, Macnaugten & Co.

Iron sash-makers.—Jas. Keir & Co., from 1788; Underwood & Co.

Smith.—Thos. Russell, from 1788.

Plumbers.—Sam. Draper, from 1788; Lancelot Burton, and Ann Draper.

Clocks and Dials.—John Thwaites and James Drury.

Cabinetmakers.—Francis Gilding and John Robins (1804).

Upholsterers.—Kent & Sons, and David Bruce.

Lamps (patent) and illuminations.—Fossick & Mathews (1812).

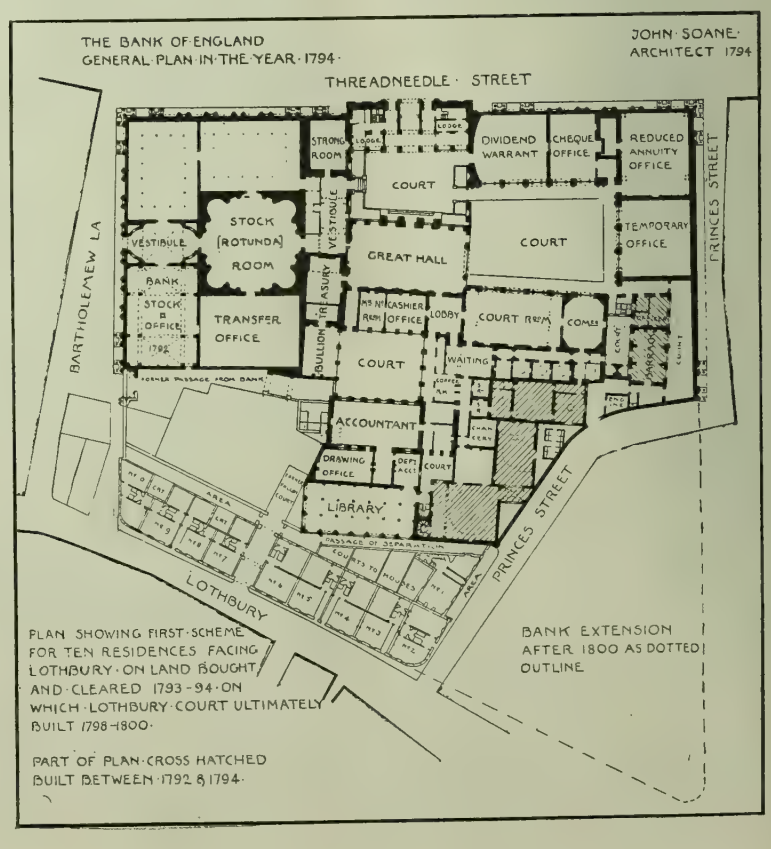
Safes.—Rowley, Culter and Machell.

Hollow Cones for vaults.—Joseph Peters (1817). No name is given for the earlier supplies of these cones.

Hot water apparatus.—A. M. Perkins, 1833 (Court room).

Gas.—Thos. Rawling, 1830 (front of Bank).

Garden.—1824, J. Allport.



These are all the names of highly competent craftsmen, who executed the modelling and decorative work, carving and reliefs from the architect's designs and instructions. Except for Coade & Sealey, who modelled and made the statues and cariatides, there is no mention of any sculptor as such. The name of Thos. Banks, R.A., only occurs once in 1789, for a mantelpiece,† though we know that he modelled the reliefs of "Night" and "Morning" in the Lothbury Court. For the latter only £200 appears in the mason's bill, which looks as if the masons cut them direct from the full size cast now in the Sir John Soane Museum. Even the pendentive cupids of the cupola of the National Debt Redemption Office in the Old Jewry, which had been thought of as possibly Westmacott's work, are merely charged in the bill of Thos. Palmer, the plasterer, in 1819, as "four ornaments of foliage at springing of dome, 2 ft. 0 in. high × 1 ft. 0 in. wide, four ditto worked by hand, 4 ft. 10 in. × 2 ft. 4 in., and four figures with torches, £5 5s. 0d. each= £21 0s. 0d. Modelling enriched friezes, flowers, soffites, &c., £20 15s. 0d."

Henry Provis, one of Soane's office,‡ is paid £58 16s. 0d. in 1796–7, for "Sundry models for use of workmen, rotunda, 4 per cent. office, and façade to Lothbury." These

*Some names run right through, others have successors, as shown by the second and third names given.

†Statuary marble chimney-piece. Mr. Newland's apartment, £94 19s. 3d. Angular columns with twisted flutes. Tablet laurel festoons on friezes.

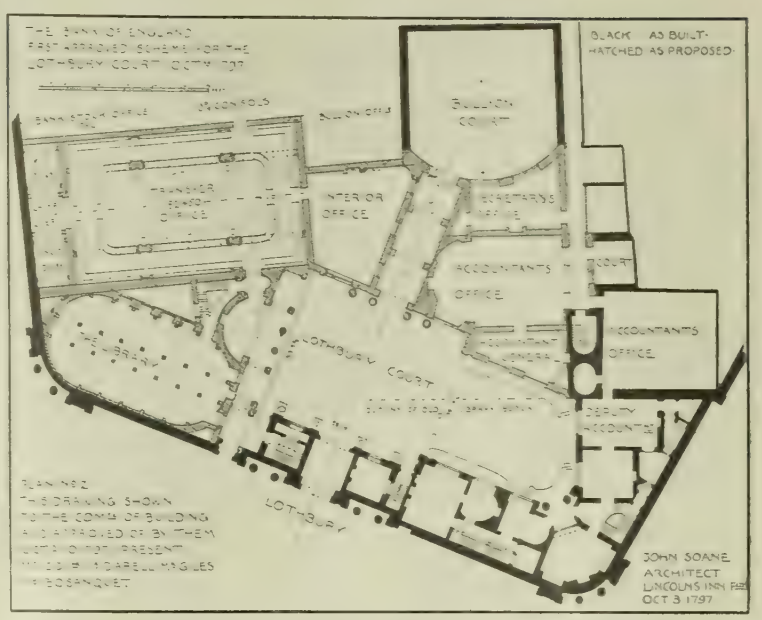
‡H. Provis, an outdoor clerk, from 1791. In 1802 he was completing his supervisory work at Tyringham, Bucks., built 1794–1802.

were probably some of the wooden models, now in the Sir John Soane Museum. The plasterers made a model of the façade of the Bank in 1825; the coppersmith, in May, 1792, makes a brass model of the roof of the Bank Stock Office, with iron rafters, pillars, fretwork, &c., for £18 0s. 0d. The capitals of the main order of the exterior are in the mason's bill, in 1795, as "James Nelson, mason, four capitals carved, £31 10s. 0d.= £126 0s 0d. Paid B. Grant for modelling a capital, £12 10s. 0d." "Paid Pelligrini* for small do., £1 1s. 0d." The same two names occur, in 1802, as "J. Pullinger, attending on workmen, £8 8s. 6d., and Benjamin Grant, modelling and casting plaister ornaments at different times, £7 1s. 0d." In 1804 these capitals were executed at £26 each, the pilaster caps at £8, the characteristic Soane scrolls at £11 11s. 0d., and the caduceus in panels, £6 each. There is a charge this year for a carver, "114 days at 6s.," comparing with masons 4s. 10d., and labourers, 2s. 11d. a day. In 1822 the column caps had fallen to £24 each. Portland stone was then 4s. 9d. per ft. cube, inclusive of duty.

A curious entry in 1802 shows that Soane made a special journey to Fonthill (Wyatt's masterpiece for Beckford), "to see doors, chimneypieces, &c., that might be used, £18 14s. 6d." It is not very probable that any were used. The following has a special interest, as it shows that the figures in the great lanterns were not from stock but specially designed :—

Ornamental Stone Manufactory. E. Coade.	£	s.	d.
1795. Modelling 12 statues for the dome of rotunda, 15 gns...	189	0	0
Masons and labourers setting same, cartage	11	2	0
	200	2	0
1799. No. 12 statues as Cariatides for transfer office, 20 gns...	252	0	0

For the Lothbury Court there are entries as follows :—



1801. June 19. Making four vases ornamented flowers and flutes	£	s.	d.
	34	16	0
Expenses modelling same ..	12	12	0
Fixing	3	18	6
July, same, repeat order ..			
August 4. Making model statue, Europa	14	0	0
Modelling statue from above..	88	10	0
Same for Asia, Africa and America			
(Total for Lothbury Court, including modeller attending several days, and directing fixing the work, £514 19s. 6d.)			

For the Consols Office of 1818–23, however, in place of Coade, we read : "Thomas Grundy, mason, 16 Cariatides at £21 each, with caps at £4 4s. 0d., as agreement," £403 ; and T. Palmer & Sons, plasterers, pendentive medallions at £10 each, plus £1 for the frame, and the caduceus below the same, 4 ft. 10 in. high, £4 each. It is curious and interesting to find in these building accounts the following items :—

1808. Joseph Nollekens, sculptor, marble busts of "The late Wm. Pitt, £105, and C. J. Fox, £126." Also in 1812, P. Turnerelli, "A large bust of His Majesty in marble, £126 ; do. of King William III, £126."

The history of the Bank building, from the account book point of view, would appear to be that from 1788 to 1792 Soane, besides ordinary maintenance works, was making some minor alterations and additions, such as vaults under Bullion Office, &c., apartment for Mr. Newland, new barracks, &c., all works in the rear of the older buildings of Sampson and Taylor. In 1792 begins the first characteristic work, the reconstruction of one of Taylor's halls, as the new fireproof vaulted "Bank Stock Office." It is evident that this work was purely internal. Taylor's screen wall façade remained until 1823. John Bayley constructed the remarkable vaulting, as an account, dated May 1—December 22, 1792, shows :—

*Possibly J. Pullinger, as spelt later.

The cones mentioned are tapering hollow blocks of terra-cotta, introduced for lightness and strength by Sir John Soane, as had been done in Byzantine times at Ravenna. Two sample ones are preserved in his museum. Immense numbers were used at various times for the vaults and domes of the Bank, and apparently the great segment vault of the Accountants' Hall is so constructed. The centering for the Bank Stock Office is charged in the third quarter of 1792, £146 0s. 0d. Thomas Palmer, the plasterer, has an account of £116 for finishing the Bank Stock Office, as "362 feet super roughing in, floating and doing in trowelled finish with stone lime the large circular soffites at 3d., £4 10s. 6d," &c.

"Ditto soffites over pilasters at 4d. spherical spandrils, do., circular mouldings on soffites, 7 in. girt, 6d., 2 in. sunk fillets, 2d., &c." The ornaments are charged as, "four raffle leaf flowers, 3 in. imbost, with lion's head in centre spandrils, 6 in. imbost, £8 0s. 0d.; eight raffle flowers, Medusa's head in centre, 35s., £14 0s. 0d.; four foliage flowers, 2 ft. 0 in. diameter, 2½ imbost, 30s., £6 0s. 0d.; 46 flowers, 3 in. imbost, 1 ft. 0 in. diameter, 7s. 6d., £17 5s. 0d." These ornaments can be seen in the photograph of the interior. The above are very good samples of the bills throughout. There is a special charge in 1793 for "ornamental painting on ceiling in Bank Stock Office, two men, three weeks each, £2 2s. 0d., £25 0s. 0d.," showing that the variety of colours still to be seen in the older offices is a tradition of the original. It might be expected to be so, in continuation of the Adam idea of Soane's youth. The change to "Yellow stone colour" comes in with the growing strength of the Greek revival, about 1800–2, when the great Princes-street extension of the Bank was undertaken. The earlier Soane work had probably strong colour, as we see it in his own house, as a good deal of scarlet appears in the bills. John Crace is employed in 1794, and the following colours are mentioned : Dead white, purple brown, veined marble, and sunk fillets, cut and shadowed, grain satin wood, gilt fillets and sunk do., black and varnished do., £17 15s. 3d. Also grey white, lilac, fawn colours, scarlet margin 1½ in., fillets in fine yellow, also in black, fine scarlet in panels varnished, Vitruvian scroll in fawn colour, 3 in. fawn margin on ceiling, &c.

In 1800 there is mention of "glazing pilasters with blue and yellow coloured glass, 144 strips at 1s. 10d., 24 small do. 1s. 3d., 72 slips of yellow glass 2s. 6d., and 96 small do. 1d.;" and in 1807 we get a note of the cost of stained glass (flashed glass, not pot metal) as yellow 5s. per ft. super, orange 8s., blue 5s. 9d. per lb. (analysed as "about 8s. 3d. a foot, about 10 in. × 10 in.=1 lb."), purple and green same price, and red 14s. per ft. There is no doubt that Soane's idea was to mitigate the cold effect of white light on plain stone-coloured walls, as Robert Adam had first used tints on his ceilings in order to reduce the glare of white plaster. The following describes and prices the remarkable lanterns with which Soane lit his novel interiors :—

Bank Stock Office (old building).

Coppersmith, Saml. Rehe.

1792. May 19. A model of brass for the roof with iron rafters, pillars and fretwork, &c., over the above office ..	£	s.	d.
	18	0	0
December 20. 1,032 super. tinned copper covering over lantern light, 18 oz. to ft., 2s.	103	4	0
12 iron bars dovetailed and let into iron rafters, 6s... ..	3	12	0
40 iron braces, three holes in each for rivets, 1s. 8d. ..	3	6	8
18 copper screws and nutts to skirting to prevent too much air, 1s. 4d.	1	4	0
24 large copper screws to the iron rim, 1s. 2d.	1	8	0
24 straps and keys with copper pins to secure the capping, 2s. 6d.	3	0	0
96 large iron braces and stays in frieze, 1s. 6d.	7	4	0
Copper rivets, 12 doz., 1s. 8d., 40 doz. at 1s. 3d.	3	8	6
Extra labour in fitting and rivetting the iron braces to the friezes, the holdfasts to the rafters and pilasters, drilling, &c., 7 men, 17 days, 5d.	19	5	0
120 lb. lead to fix copper holdfasts on pilasters and labour running and melting, 3d..	1	10	0
	165	2	10

Saml. Rehe also supplies the Bank Stock Office finishings as "brass beaded mouldings to the counters and doors, 108 ft. 7 in., weighing 421 lbs. 13 oz., at 5s. 6d. lb., £116 0s. 0d., with labour, &c., 11th May to 5 June, £152 total bill." The heating of these great halls was another great problem. Evidently at first Soane continued the "serpent stoves" that Adam had used in his rotundas, as "April, 1793, erecting a heating stove to warm the Bank Stock office placed in the cellar underneath according to the estimate, £138 18s. 0d." "7 square cast-iron boxes fixed in the thickness of the arches to clean the revolutions of the flues, &c., total bill, £159 10s. 0d." Following on this, however, independent stoves, placed against the main piers, were used. After the Bank Stock Office, the next important undertaking was the reconstruction of the old rotunda of Sir Robert Taylor with a fireproof dome, in place of lath and plaster. As "Midsummer to Michaelmas, 1795, Thos. Poynder, bricklayer, 3,493 cube brickwork in dome, done with kiln burnt bricks and tiles with stone lime, 1s. 10½d., £327 9s. 4½d." The centering for the dome, by Jas. Swinton and Richard Martyr, carpenters, cost, say, £400, as "2,662 ft. super spherical cradling for dome in 128 pieces, close boarded, at 10d. 987 ft. 6 in. cube rough fir frame at 2s. 3d., circular curb and purlins at 4s. 6d.," &c.

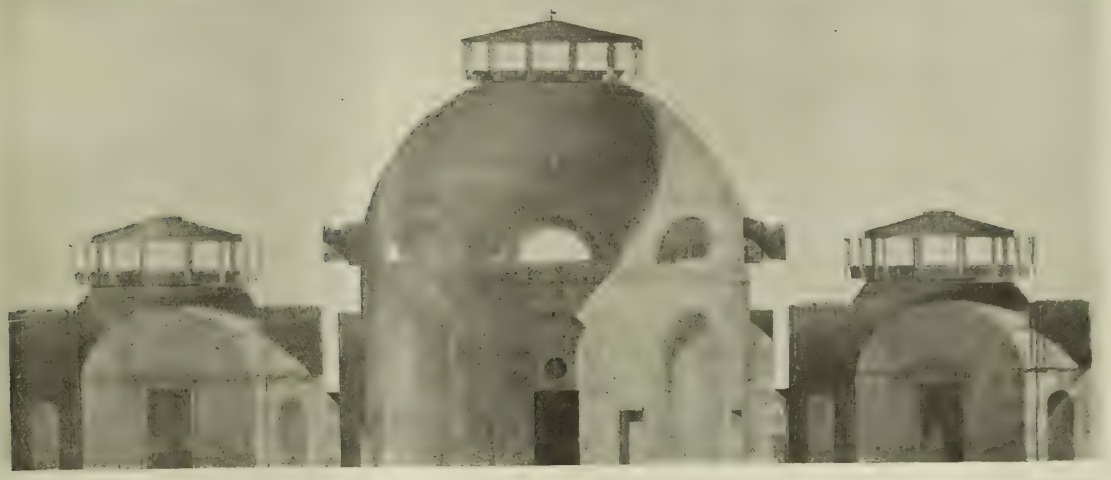
The Portland stone at this time cost 2s. 4d. and extra freight 4d., and duty 6d., 3s. 2d. ft. cube. As regards the plaster finish of the rotunda, there is a bill of John Bayley "September 30–October 27, 1795 (exclusive of contracts), 1,183 super ft. plain face in composition, 9d. Plain mouldings, 2s.," and the wages charged are: Men, 3s. 6d.; ornaments do, 7s.; labourers 2s. 4d.; boys, 1s. 2d. per day. For warming the rotunda in October, 1795, "two very large patent philosophic rarefying stoves, extra strong metal with double back and cast feet" were installed, and Soane reduces both of them from £20 to £17 10s. 0d. in price. It is to be hoped that they were more successful than such things usually proved to be in heating such a vast space.

A clock maker, James Drury, supplies a great clock with a 4 ft. dial, for £101 10s. 0d., but the remorseless Soane cuts it down to £80. It does not appear where the clock is to be placed, but probably it was for this rotunda which was, of course, at this period the Stock Exchange, being entered from Bartholomew-lane, through the still existing vestibule of Sir Robert Taylor's design. The circular lantern on the top of the rotunda was supplied by James Keir & Co., October, 1795, for £135 5s. 0d., as "frames, £40 10s. 0d.; sashes, £50 19s. 8d.; extra casements to open, £15; and glazing, £28 16s. 4d." The fanlights in the arches below cost £18, as "January, 1795, six large semi-circular iron fanlights with wainscot frames and iron bottom rail, to sketch received, glazed and painted complete." John Thwaites, October 5, 1795, supplied for £36 0s. 0d. "A wind dial to show horizontal in centre of dome of rotunda, 5 ft. 0 in. copper dial plate, black with gilt letters, &c.", showing that originally the top of the lantern of the rotunda was not all of glass. In 1792 the purchase of Haines Estate in Princes-street had made possible the large extension that followed at the rear of the Bank. Soane was paid £70, 1 per cent. for his services in this acquisition. While this was going on, piles were being driven for the outer wall, as "2,888 cube rough fir and labour in piles drove in foundation in Lothbury, 2s.," and "Alex. Goudge, paviors, delivered Princes-street for foundation, July to November, 1795, 100 tons picked large size pebbles delivered at 16s., £80 0s. 0d." There can be no doubt that the new façade wall in Lothbury, forming the back enclosure of the Bank site, as at this time extended, was erected at once for a protection, leaving the final determination of the offices to be built behind it for future consideration.* It would appear that the internal outline of the Lothbury Court and the group of buildings adjacent, *i.e.*, the Residents' Court, &c., was only settled at the end of 1797. Soane, no doubt, had a general idea in his mind,† but it is quite clear that no final plan had been arrived at and settled with the Committee of Building until October 10, 1797.‡ It is astonishing, but true, that, apart from Sir John Soane's genius for grasping an occasion, the Lothbury Court, instead of being the realisation of a great Court, as dreamed of by Palladio, might have been a mere back yard for the bullion and stationery vans to draw into. The Lothbury side of the Court, the first built, illustrates this, and it will be seen on the plan of 1797 that the screen of columns across the Residents' Court, though a key idea of the design, has evidently been sketched in afterwards. It is more than likely that the Committee never passed it. The design, as in the case of St. Paul's, grew in the course of execution. The absence of what Soane calls a "closed contract" suited the fluid character of his design, which achieves its end by a constant scrapping of ideas, felt to be capable of re-statement in a better form. The new Library (which replaced the old, pulled down to facilitate the new extension) and the Transfer Office were in hand, 1798–9. The reconstruction of another of the offices, built by Sir Robert Taylor, in lath and plaster with wood columns, was effected by John Bayley, 1796, whose account is: "Building the arches and dome in the late 4 per cent. Consols Office § with paving bricks and cones set in composition, according to the plans and sections as directed, and finishing in compo all the external parts, and a rough coat on all the internal parts, as per contract, £1,683." And a letter is copied into the book, "John Soane to the Governor," "the work of the 4 per cent. Office being nearly completed" to pay £1,000, June 23, 1796. James Swinton and Richard Martyr, carpenters, charge for the centering for the vaults of this office, £155 10s. 10d., the items being as for example, "13 squares, 38 ft., extra strong centering to segment arches, at 18s., £12 0s. 0d., &c."

The original flat copper tops of the lantern light cost £101 17s. 11d., and the plasterer's account (1796), including ornaments, panels and mouldings, is £194 7s. 2d. Part of the inside scaffold in the office fell, as in the last quarter of 1796 Surgeon Lewis Lease receives £16 15s. 0d. for attending accidents at the Bank," and a publican, Free, is paid £26 7s. 9d. for beer for the workmen, and in 1800 appears an item "Amount of cash paid the men who fell with the scaffold in the 3 per cent. Consol Office." In 1804 the famous Governor's Court, one of the most original features of the interior of the Bank, was in hand, James Nelson, mason, as "Last quarter, 1804:—

	£	s.	d.
"99 ft. super. rustic work face of arches in Court, 5s.	24	15	0
14 ft. 6 in. do. do. in soffite, 6s.	4	7	6
No. 1. ¾ antique pilaster cap ..	18	0	0
„ 2. Do. do. column cap ..	36	0	0
„ 2. ⅞ do. do. do. ..	39	0	0"

*S.N.B. "Feb. 27, 1796. Mr. Meyer finished drawings of Bank Gateway." Oct. 30, "Settled finishing rooms over gateway." (Soane's office at the Bank over the Lothbury entrance.)



†Soane was making plans January 14–15, 1797, for this new vacant land.

‡ "September 19, 1797. Presented two plans and two small models for the improvements adopted by the Committee of the Treasury to be recommended to the General Court of Directors." At this meeting one of the Committee appears to have indulged in some possibly harsh criticism of the Architect, but the Memo. is written in such an agitated hand as to be indecipherable. Probably it was a reflection of the unfair external attacks made against Soane at this time, 1796–7.

§ S.N.B. "July 19, 1796. Settled about finishings to the 4 per cent. office. Sept. 12, Do. 4 per cent. office to be finished by Christmas." The same month Soane is engaged on plans for the new Consols 3 per cent. office.

Interior of Bank Stock Office.

Section: Rotunda of Bank of England and Consols Office.

Masons were then getting 4s. 10d. a day, labourers 2s. 11d., carver (114 days) 6s. Mortar, 6d. a hod. Cube Portland is 4s. 5½d., including war freight and duty. Plain work on same is 1s. per ft. super., and sunk and moulding work, 1s. 3d. Previously these prices had been 10d. and 1s. There is nothing in the accounts to particularise the beautiful loggia, full of Greek feeling, standing over these arches, nor can the Tivoli Corner be identified. It is merely evident from the large amount of circular work that appears in the bills of 1804–5. The plumbers, Lancelot Burton and Ann Draper, charge cast lead at 36s. cwt. Plumbers get 4s. a day. "A new angular anvil rainwater head" is priced at £3 3s. 0d., and 6 in. lead R.W. pipe at 6s. 6d. a ft.; these prices had been £2 2s. 0d. and 6s. In 1789 cast sheet lead was only 23s. cwt., milled do. 24s., and plumbers had 3s. a day. In 1805 the bricklayers are carrying up the east and south fronts of this Court and putting in foundations of the new screen wall.

The formation of the arches of the new vestibule, Princes-street entrance, is priced in the last quarter of 1805. Bricklayers in 1806 are 4s. 10d. a day, and 4s. 4d. winter; labourers 2s. 10d. and 2s. 8d.; a load of 29 hods Dorking mortar. 30s.; grey stocks, 50s. a thousand; malms, 77s.; paving bricks, 70s.; plain tiles, 53s.; cones, 136s. 6d.

Brickwork a rod is £16 8s. 0d.; with malm facing, 4d. ft. extra.

There is a first mention of Parker's Stucco (Roman cement ?) jointing in piers and openings, 4s. 6d. a yard. In 1789 brickwork, grey stocks in foundations and wall to Princes-street, cost only £9 a rod; bricklayers, 3s. 4d. a day; labourers, 2s. 2d.; and grey stocks were 30s. a thousand. Masons were only at the same level; carpenters, 3s.; plasterers, 3s. 10d. a day, instead of 3s., illustrating the rise, no doubt largely due to war conditions. A curious item in 1800 is "Painting two French soldiers with cutting them out complete for Armoury, £4 14s. 6d." Possibly they were for target practice? At this time an item "Painting a model of the new building, 7s. 6d.," appears in the painter's bill. The Peace of Amiens, though short lived, was welcomed with illuminations, as "Transparent painting by Robert Smirke for south front, April 29, 1802, £84 0s. 0d." Two others are supplied by Wm. Miller, £42 and two old ones are altered and repaired for the occasion by Cornelius Dixon (probably Wyatt's clever assistant), £14 14s. 0d. The Victory of Vittoria, however, was kept with three days of illuminations, July 5, 6 and 7. The first day 3,171 lamps; second, 6,195; third, 6,995, 16,361 lamps at 7d. each, Fossick and Mathews, £477 3s. 11d. While the following year, April 11, 12 and 13, 1814, 36,115 were used at a cost of £1,053 7s. 1d., and on June 9, 10, 11, no less than 149,500 were used at a cost of £4,360, with, besides, "150 two-spout lamps for transparency, £22 10s. 0d." Waterloo falls behind this as the illuminations on June 23, 24, only required 16,228 lamps at £473 6s. 4d., and in 1821 George IV, on July 19, gets only 6,544 lamps, costing £195 17s. 4d., and for William IV, September 8, 1831, a mere £27 13s. 0d., seems to have been sufficient. A most significant record of comparative national enthusiasm.

"1804. Plaisterer, Thos. Palmer.

"Accountants' Hall and Passages each side of Vestibule :—

223 plain „ 3 in. „ 3d.	2	15	9
98 flowers trimmed hollow, 6d. ..	2	9	0
One ornament 20 ft. 0 in. long, consisting of two cornucopias tied with ribband, oak leaves at centre, fluted at wreath with fruit, flowers, &c.*	8	8	0
103¾ days plaisterer, as per Note, 5s.	25	18	9
Two days ornament, do., 8s. ..		16	0
38¼ Labourers, 2s. 10d.	5	9	1
41¾ boys, 1s. 7d.	3	6	1

Total plaisterer's bill, £511 10s. 8d."

Wm. Rothwell, Junr., the other plasterer, sent in similar bills.

Very few people realise that the Threadneedle-street front, the return façade halfway down Princes-street, and nearly all that towards Bartholomew-lane, only date from 1823. The screen walls, erected by Taylor in extension of Sampson's original Bank, were still standing in May of that year when Sir John Soane addressed a Report "to the Honorable, the Governor, the Deputy Governor, and the other Members of the Committee of Building." He says: "I am induced now to offer a few words on the subject, as the state of the exterior of the Bank requires immediate attention, and the regularity of the building must depend on the present determination of the Committee. . . . To restore the exterior of the south, east and south-west wings, in the same form they now are, without rounding off the corner next Bartholomew-lane, and without increasing the thickness of the walls in the several recesses (of Sir R. Taylor's arcaded design), so very necessary to be done, the expense will be about £10,000; but if the necessary additional strength be given to the building, and the angle next Bartholomew-lane curved, according to the design submitted, it will add materially to the safety and convenience of the Public, and the expense will not exceed £12,000. Permit me to conclude," he says, "by observing that, if the first idea, namely, that of restoring the south-east and south-west wings to their original form (Taylor's design), should be adopted this great national establishment will then present an irregular assemblage of heterogeneous parts, but, if it should be the pleasure of the Committee to approve the plan submitted, the whole of the exterior of this extensive pile, erected at so many different times, and under many different circumstances, will appear uniform, simple and characteristic.

"All of which is submitted, John Soane, Architect to the Governor & Co. of the Bank of England. 28 May, 1823."

The veteran architect was then 69, and had spent 35 years on the work, and his concluding and very significant words are eloquent of the spirit that was carrying him through to the final completion of his great task. This report of his shows clearly that, while Taylor's walls were rebuilt, the centre, by Sampson, was only cased up. The estimated cost seems very small, but Sir John Soane was so extraordinary punctilious and successful in not exceeding his estimates that it is unlikely that it was surpassed. He was helped by the fall in prices, as in 1825 Portland stone was down to 3s. 5d. ft. cube. For the recesses, "18 Portland stone trusses, 2 ft. 3 in. long with 6 in. face" are only charged at 90s. each, for masonry and carving, while the honeysuckle ornaments over doors cost 30s. each. It had been charged against Soane, in 1797, that he should have continued round Lothbury the design of Taylor's wing, but Soane's clear answer was that the scale of the older screen wall was too small, and that, owing to the great fall in the ground at the back, Taylor's order would have had to stand on a disproportionate high plinth. There is not a shadow of doubt that Soane was right in his refusal to be tied to the old scale of height.† As it is the greatest defect on the Threadneedle-street front is the absence of any plinth. It is very possible that, as is constantly happening in London, the pavements have been raised, and certainly in 1796 no one foresaw the vast extension of the future Bank, but one cannot help regretting that the base level of the new order at that date was not set higher by two or three feet, which would have in 1823 greatly aided Soane in dealing with the Threadneedle-street front. It is unfortunate that the main front of the Bank was deferred so late, and that the earlier and fresher work of Sir John Soane has always been at the rear of the building. Artistic opinion crystallised at

* The original model for this is in the Sir John Soane Museum.

† *Taylor's Order*: Plinth, 4 ft. 9 in.; column, 14 ft. 9 in.; entablature, 3 ft. 3 in.; balustrade, 3 ft. 6 in. =26 ft. 3 in. *Soane's Order*: Plinth, 7 ft. 8½ in.; column, 23 ft. 4¼ in.; entablature, 4 ft. 1½ in.; blocking, 3 ft.; attic, 7 ft. 3 in. =45 ft. 6¾ in., or without attic, 38 ft. 3½ in. The difference on the column, 23 ft. 4¼ in. as against 14 ft. 9 in. was vital.

once on the Tivoli Corner as the masterpiece of the architect, and that, as we have seen, is work of the 1805 period. Soane had been through some bitter experiences in the 18 years that had elapsed, and though the fire of his enthusiasm still burnt, much of the joy of existence had been clouded over. In 1824 he had an operation for cataract, and his health was badly shaken; only his indomitable spirit carried him for another decade, until his resignation in 1833. Concurrently with the decision to complete the façades, it was decided to enclose the Bank with a railing. Probably Soane greatly regretted the necessity of this addition. In 1824 the smith supplies "148 ft. 3 in. feet run handsome framed railing and double top rail, ornamental spike heads, fixed with cast blocks, including patterns complete, £489 7s. 11d." "Cast iron and lead, 32s. cwt., wrought iron 74s. 8d. do."

The process of taking the railing all round the Bank went on for some years. The Garden Court was laid out May, 1824, J. Allport being the gardener and florist. Laurels, box, lilac, rhododendrons, cedars, azaleas, geraniums, hydrangeas, &c., are included in a bill of £28 9s. 6d.

In June and July, £10 15s. 0d. is spent on flowers, and in August and October, £3 14s. 6d. for chrysanthemums, privet and holly. At this time there is a mention of steel shutters—7 pairs for £102 16s. 3d.—no doubt for the doorways. In 1827 the rotunda is provided with a new skylight costing £46 12s. 0d., and in 1830 new skylights were supplied to the Bank Stock Office and the vestibule to Bartholomew-lane. The first mention of hot water apparatus occurs in 1883, when £100 was paid for Perkins's high pressure system for the Court Room. This is the same apparatus as that installed at the Sir John Soane Museum in 1831, where it is still in use, as also at the Royal Society of Arts in the Adelphi. No doubt after this date the old stoves gradually disappeared. Gas was only slowly introduced, as in 1833, in the Lothbury Court, and Bullion Office Court. It only remains to call attention to the remarkable table of annual expenditure on the Bank, which follows. This of itself dates the principal periods of the work by the rise and fall in the annual outlay under Sir John Soane's direction. This remarkable, if not unique, record of the actual process of the work fully bears out the claim, made on other grounds as well, that the Bank of England is a great national historical building. Others, as will have been seen, as well as Sir John Soane literally built their lives into the building, and in the future, as is perhaps better recognised to-day by our cousins than ourselves, the Bank will be regarded as important a link in the chain of national history as any work of the Middle Ages.

Annual Expenditure on the Bank from 1788 to 1833, from the half-yearly statements, rendered by Sir John Soane to the Governors:—

		£	s.	d.
1788.	Sir John Soane appointed Architect, October 16			
1789.	Half-year to Xmas (New Barracks and some alterations)	6,082	15	1
1790.	Whole year (New Barracks and some alterations and back additions)	11,393	3	4
1791.	(New Barracks and some alterations and back additions)	13,014	2	7
1792.	Bank Stock Office reconstructed	9,430	9	6
1793.	Do. do.	10,646	17	3
1794.	First half of façade to Lothbury before it was doubled in length by the 1800 extension	22,025	1	2
1795.	(First half of façade to Lothbury before it was doubled in length by the 1800 extension)	29,291	11	0
1796.	(First half of façade to Lothbury before it was doubled in length by the 1800 extension)	26,210	17	3
1797.	Lothbury Court (after October 10, 1797)	17,946	12	5
1798.	Do. do.	22,696	18	5
1799.	Lothbury and New Library and Transfer Office	22,824	11	9
1800.	Do. do.	16,669	13	2
1801.	Completion Lothbury Court and New Accountants' Office	25,449	14	5
1802.	Extension Princes-street and Lothbury	15,600	6	1
1803.	(Extension Princes-street and Lothbury)	29,485	10	9
1804.	Do. and Tivoli Corner built	33,881	13	6
1805.	(Do. and Tivoli Corner built)	49,926	18	1
1806.		25,546	14	5
1807.	Includes Robins for Desks, &c., £1,745	33,583	7	8
1808.	Includes the 5 new Houses, Princes-street	46,464	1	0
1809.	Do. do.	24,494	0	1
1810.	Do. do.	41,603	6	1
1811.	New Houses still in hand	23,617	10	2
1812.		11,042	15	10
1813.	Illuminations (Vittoria) July and also November, say, £1,000 (included)	12,167	17	10
1814.	Illuminations April and June (£5,440 16s. 5d.)	18,648	4	1
1815.	Illuminations, June 23, 24 (£473 6s. 4d.), New Treasury and entrance to Rotunda, &c.	18,335	4	2
1816.		22,290	11	9
1817.		16,793	9	4
1818.	National Debt Redemption included	24,356	19	2
1819.	Do. do.	35,320	6	5
1820.		15,181	0	3
1821.		10,867	9	6
1822.	Additional room N.D.R. Office	15,786	1	11
1823.		14,754	17	5
1824.	Bank Garden (Bank railings begun)	20,025	9	5
1825.	Completion work to façade to Threadneedle-street and returns to side street	15,835	19	7
1826.*	(Completion work to façade to Threadneedle-street and returns to side street)	16,705	0	3
1827.	(Completion work to façade to Threadneedle-street and returns to side street)	10,650	7	3
1828.		5,255	9	2
1829.		3,482	2	1
1830.		5,029	13	9
1831.		5,886	8	8
1832.		6,249	5	8
1833.	Sir John Soane resigned, October 16	4,051	12	0
	Estimated total for the 45 years, 1788–1833	£866,602	0	8

*From this time the Bank of England began Branch Banks at various provincial centres, but these accounts are not included, being separately rendered by Sir John Soane. These early local banks seem to have been mainly alterations of old premises. C. R. Cockerell, successor to Soane in 1833, began the series of important new buildings as at Liverpool, &c.

Excavating for Roman Relics.

To-morrow (Saturday) excavation work will be resumed for Roman relics at Richborough Castle, near Sandwich. Soil will be turned over which has lain undisturbed for quite 1,400 years. The work is being undertaken by the Kent Archæological Society, in conjunction with the Society of Antiquaries and the Society for Promoting Roman Studies. Richborough is one of the most important Roman sites in this country. It was the port of passage between Britain and Gaul, and later was one of the chains of forts erected on the East and South Coasts against the Saxons.

House at North Lancing. Mr. C. Cowles-Voysey, A.R.I.B.A., Architect.

[This house, which is now being completed, faces south towards the sea. It contains two living-rooms and four bedrooms. It is built with cavity brick walls, plastered externally, and cream washed. The shutters and doors are painted green. The roof is covered with interlocking double Roman tiles.]

ILLUSTRATIONS.

P.L.A. Sports Pavilion, Stands, and Groundsman's Cottage at Ilford.

These buildings are to be erected on the Port of London Authority's Sports Ground at Ilford.

The pavilion stands on elevated ground commanding a view of the playing field and the surrounding country. The walls are faced with 2 in. light red bricks with darker bricks for dressing of quoins, window jambs and plinth. The stands are situated below the pavilion, and are constructed of timber with a tile roof. The groundsman's cottage lies behind the pavilion, and is treated similarly, but has a steep-pitched roof of tiles.

The pavilion has a feeling of breadth and dignity of treatment which are pleasing for a central feature in the sports grounds. The picturesque cottage for the groundsman appears to the left of the view.

The work will be carried out by Messrs. William Saint, Ltd., of Cambridge; electric lighting by Messrs. Higgins & Griffiths, Ltd.; heating and ventilation by Messrs. Mumford, Bailey & Preston, Ltd.; The clerk of works is Mr. Le Marie.

Sir Edwin Cooper, F.R.I.B.A., is the architect.

New Offices, East India Dock.

This building is being erected on the quay of the East India Dock, facing the Export Dock. Accommodation is provided for the Warehouse-keeper and staff, with a large general office, pay office, dining room, kitchen, scullery, heating chamber and lavatories.

The walls are faced with light red bricks, dark bricks being used for the dressing of quoins, window jambs, and plinth. The roof over the centre portion of the building is covered with pantiles with concrete flats at each end.

The building contractors are Messrs. Walter Lawrence & Sons; electric lighting, Messrs. Higgins & Griffiths, Ltd.; heating and ventilation, Messrs. Mumford, Bailey & Preston, Ltd. The clerk of works is Mr. Le Marie.

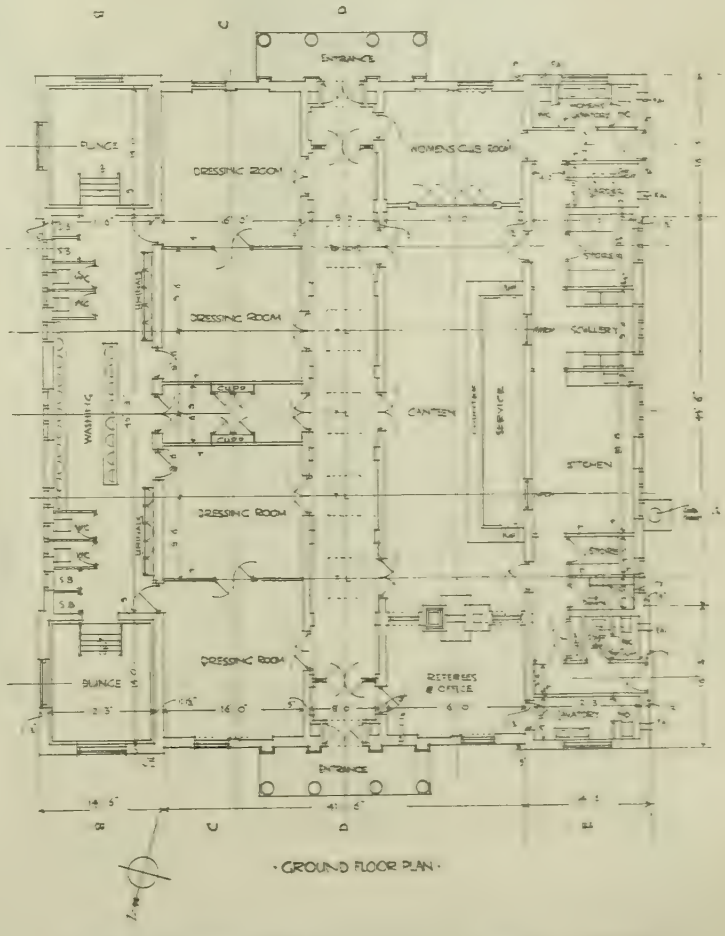
Sir Edwin Cooper, F.R.I.B.A., is the architect.

Dockmaster's Offices, King George V Dock.

This building, of which Sir Edwin Cooper, F.R.I.B.A., is the architect, is being erected on the Pier Head of the lock of King George V dock, providing accommodation for the Dock-master, pilots, searchers, foremen and lockmen, with a rope store adjoining.

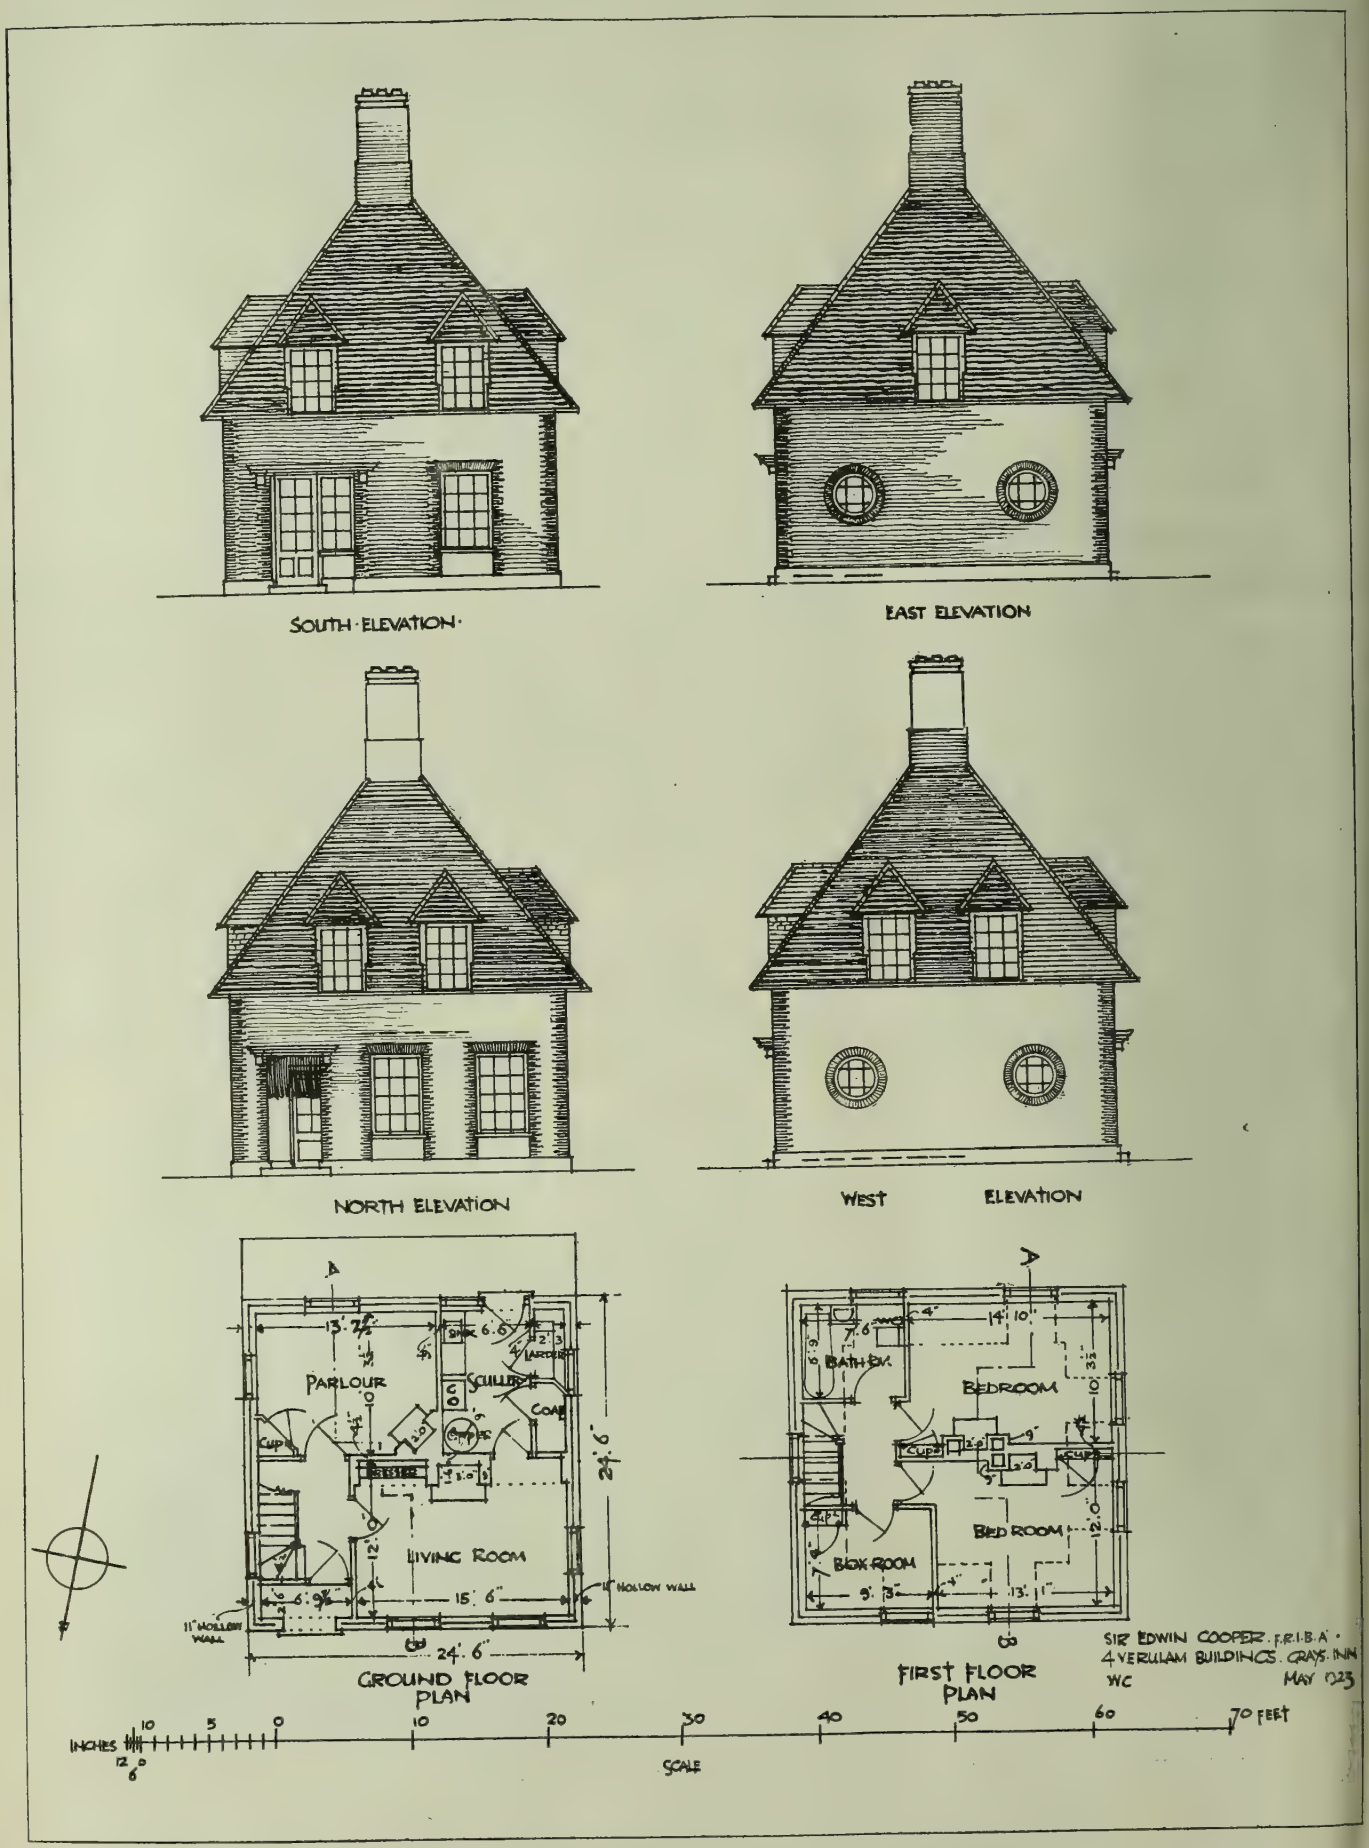
The exterior is of 2 in. red bricks, dark bricks being used for the dressing of quoins and window jambs, and a lighter shade for the walls. Tiles are used in the arches. The roof is covered with pantiles.

The contractors for the building are Messrs. Walter Lawrence & Sons; electric lighting, Messrs. Higgins & Griffiths, Ltd.; water and gas mains, Messrs. Mumford, Bailey & Preston, Ltd. The clerk of works is Mr. Le Marie.



Port of London Authority Building.

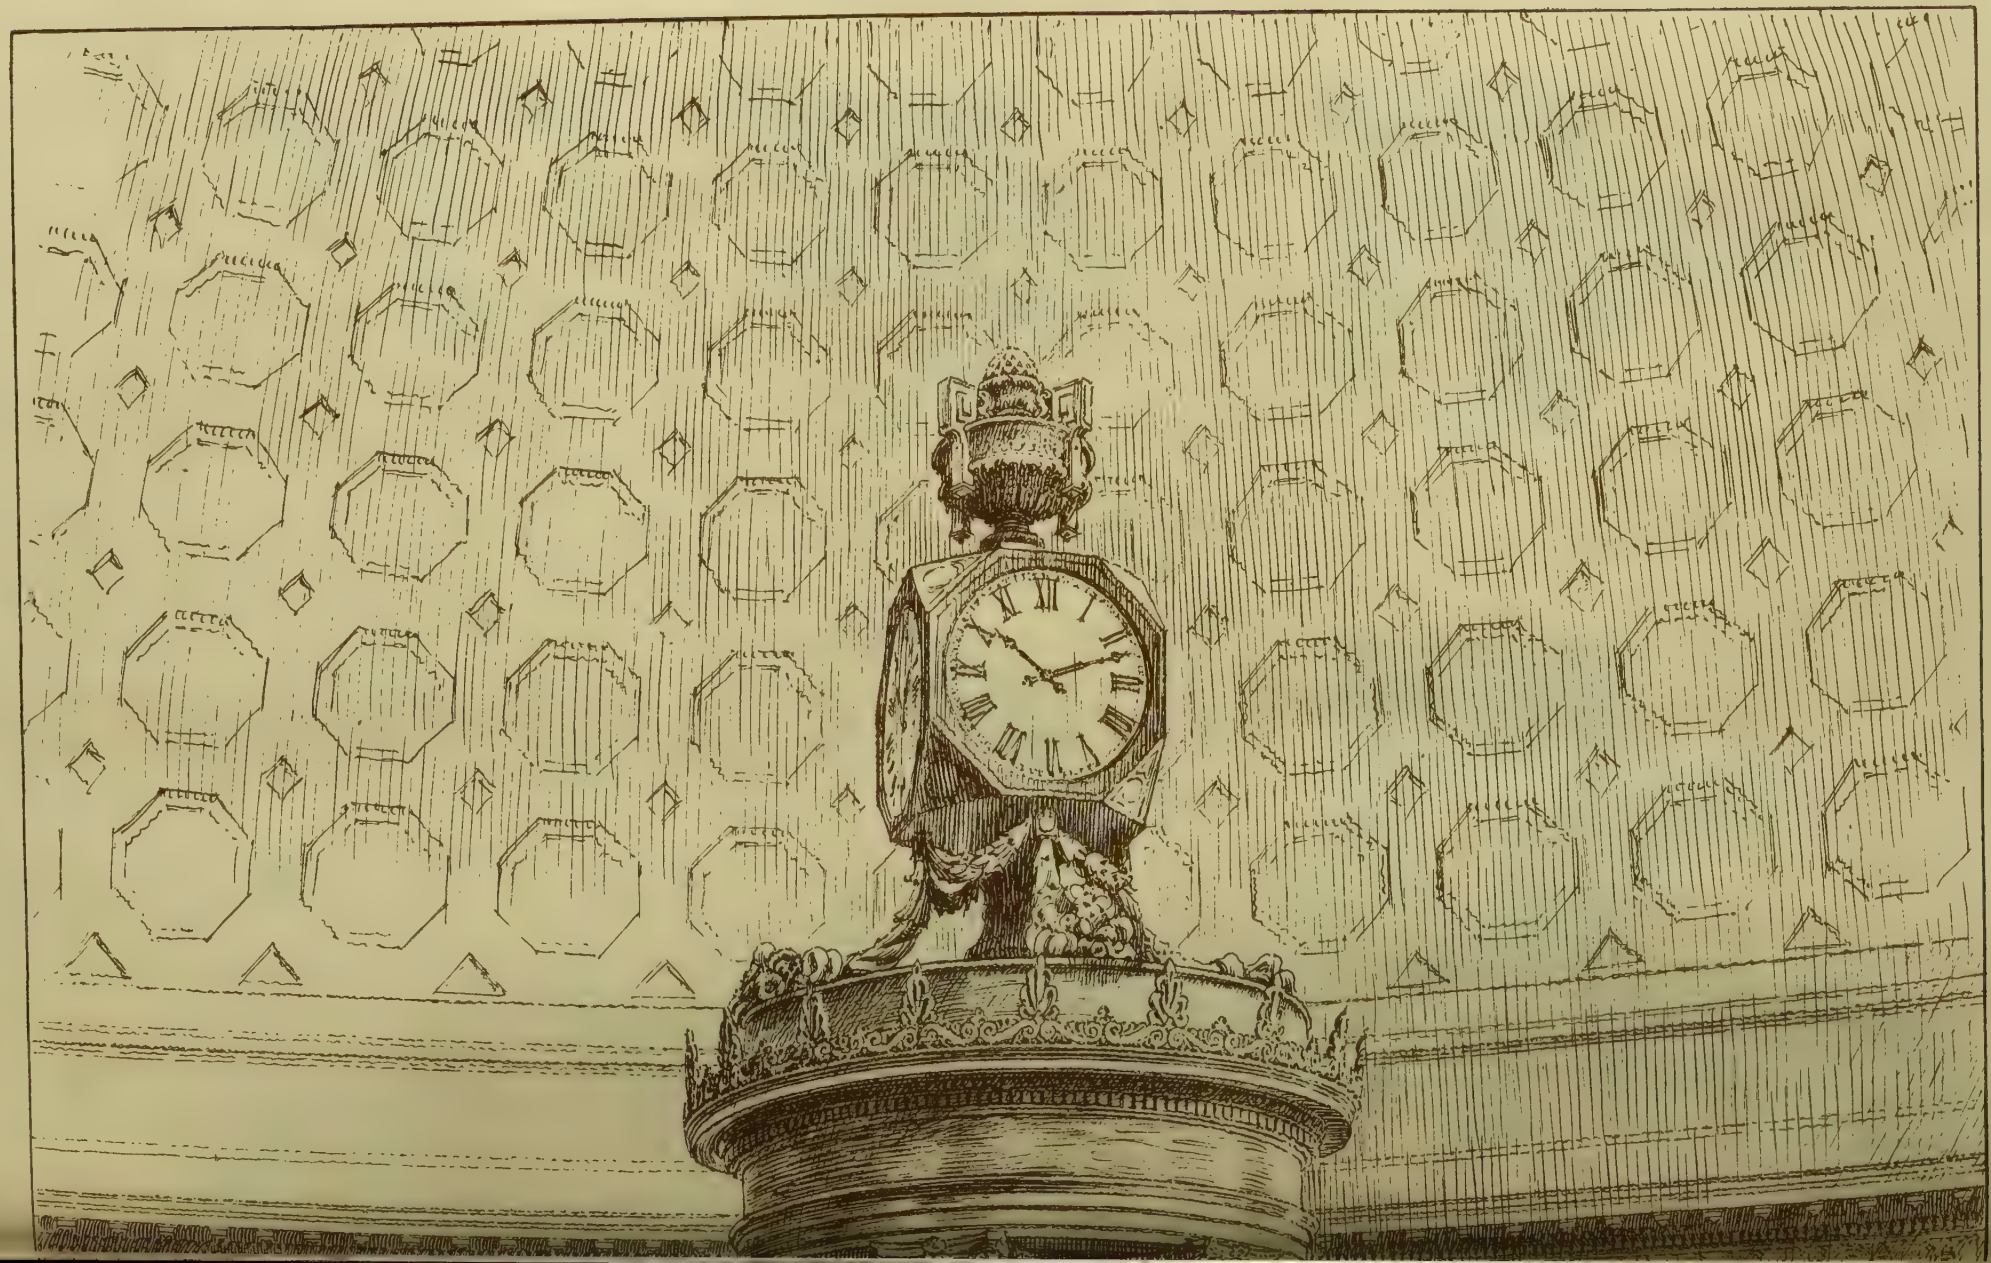
We also illustrate the Rotunda of Sir Edwin Cooper's Port of London Authority Building, Tower Hill. The clock tower, counter and desks in this Rotunda were made by Messrs. John P. White & Sons, Ltd., of The Pyghtle Works, Bedford, to the designs of the architect.

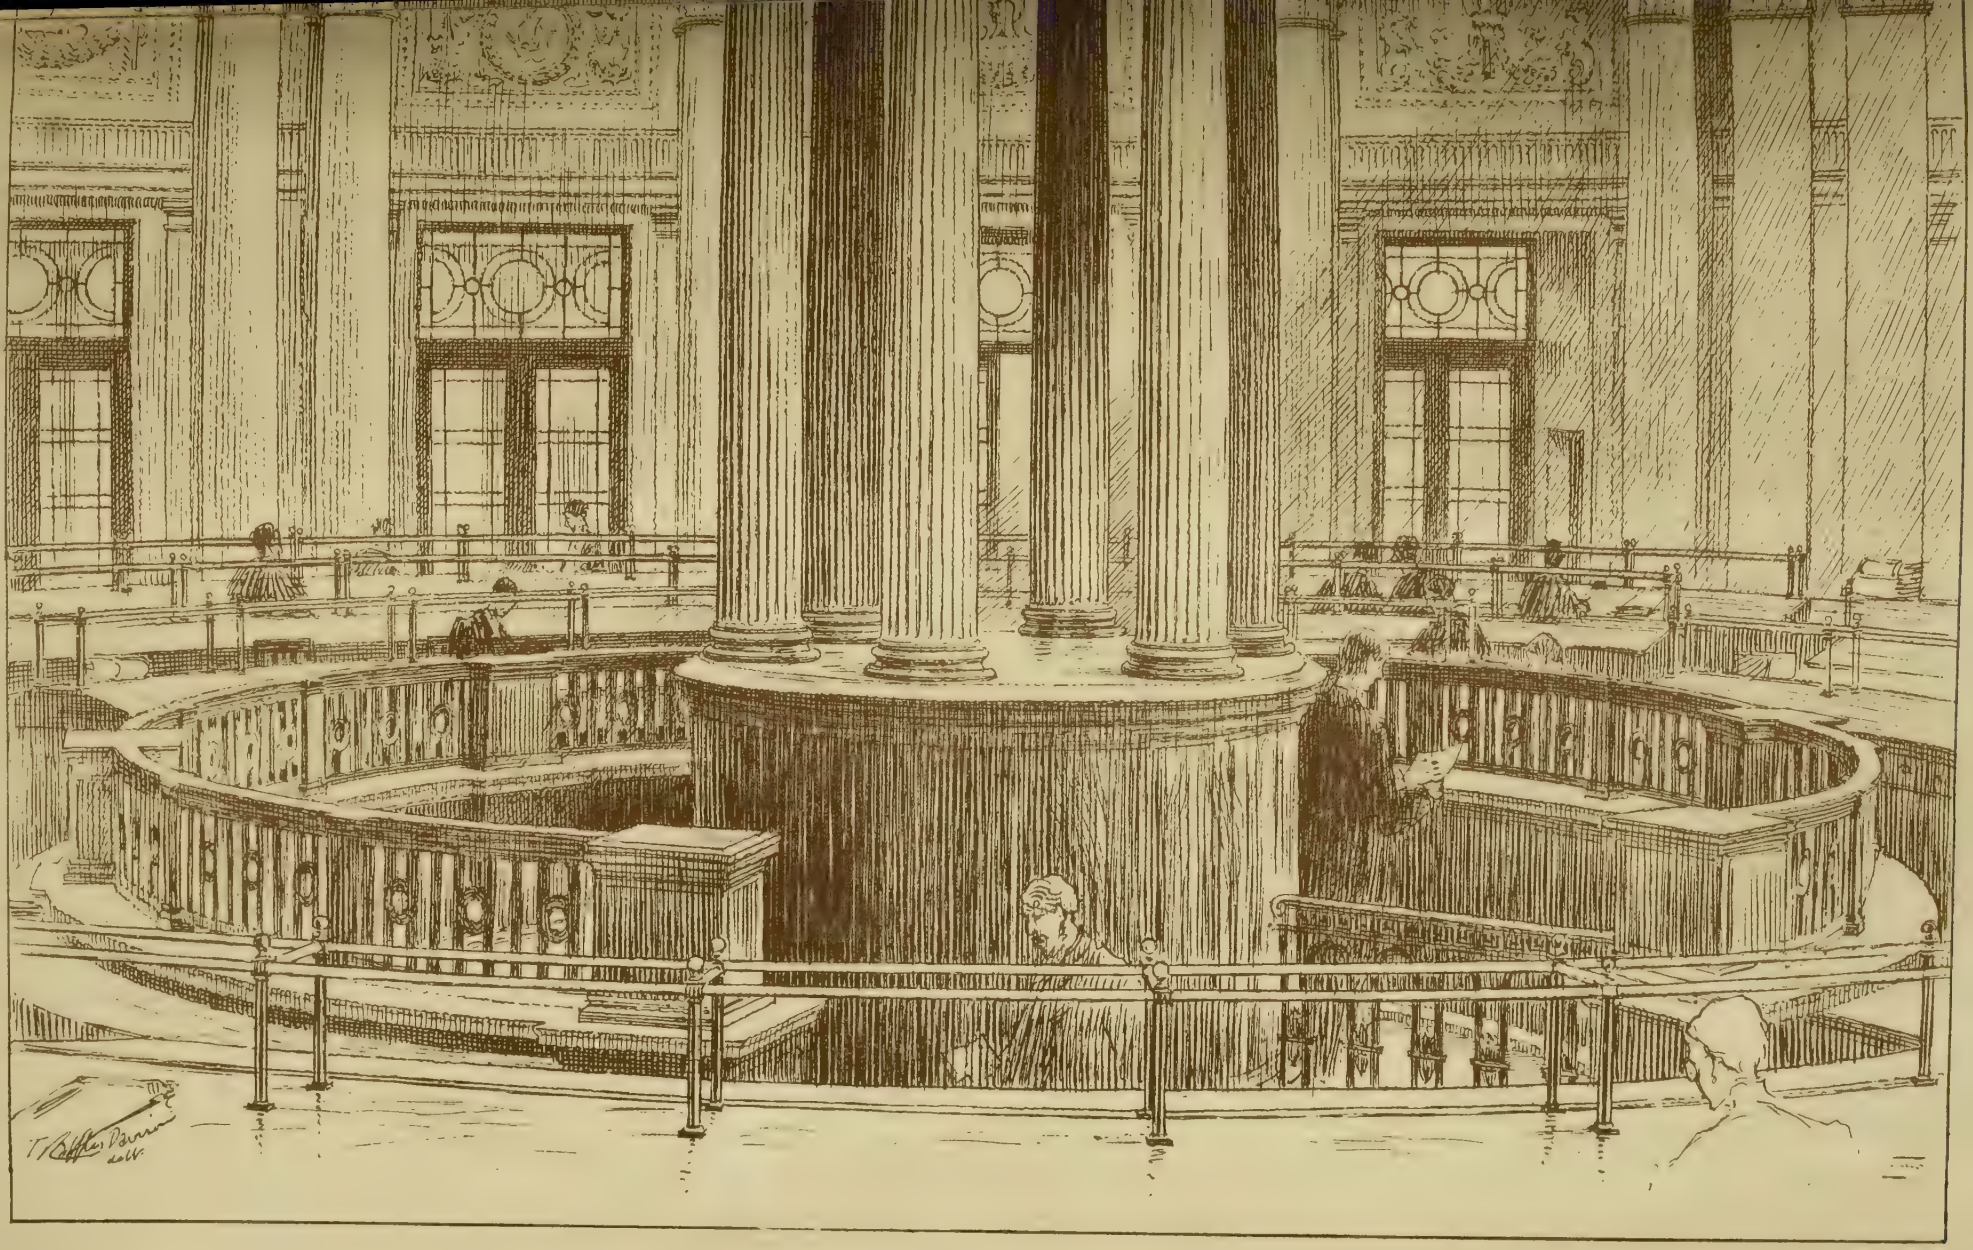


EXHIBITION NOTES.

NORFOLK AND NORWICH ARCHITECTURAL EXHIBITION.

The recent exhibitions of architectural photographs which have been held in London and the provincial cities of the country, particularly those arranged by the Royal Institute of British Architects and the Architecture Club, have no doubt been a stimulus to other architectural societies to bring together not only drawings or sketches of proposed or executed work, but photographs of completed buildings. We confess to a preference for the exhibition of drawings, as drawings are the basis of architecture, and can give at least as satisfactory a representation as photographs of a building as it is. Photography has helped to create public interest in architecture, and this, of course, is one of the objects of these exhibitions, especially when they are housed in buildings to which the general public have free access. For these reasons we think the Norfolk and Norwich Architectural Association was well advised to hold their recent exhibition of architectural drawings and photographs in the new gallery of Norwich Castle Museum, where the exhibits were appropriately grouped on the walls, and made a highly creditable display. The exhibits were not all of recent work, but from both photographs and drawings we realised that there has been a fair amount of activity in the district, especially in housing work and war memorials. One of the best collections, of drawings and photographs, was that of Mr. G. J. Skipper, F.R.I.B.A., of Norwich, whose Holt housing scheme, which we recently illustrated, was represented by an excellent drawing by Mr. T. Raffles Davison. Mr. Skipper has given a good deal of attention to building in clay lump, and has shown that the material is well adapted to cottage building, several of the cottages which he exhibited being built of this material, and at a cost which suggests that more use might be made of it for cottage building. The Holt, East Dereham, Lenwade, and Poringland cottages, amongst others, are admirable in design, and show what can be done by a competent architect. A collection of photographs of recent work by Mr. J. Page, B.A., A.R.I.B.A., was shown, including the Harris memorial reredos at Langham St. Andrew, Norfolk, and the war memorial screen at Great Ryburgh, both interesting works, while drawings of Wolterton Manor, East Barsham, showed a scheme of partial restoration. Messrs. Lacey & Upcher's exhibit consisted of various war memorials and church work, including the restoration of St. Martin's Church, Overstrand. Messrs. E. Boardman & Son's collection, mainly of photographs, showed both domestic and public work, including Carrow Abbey; Jenny Lind Hospital, Norwich; Stuart Court, Norwich; and house at Drayton, Norwich. Mr. Stanley Wearing, A.R.I.B.A., showed several housing schemes of interest, two of the principal being Lowestoft Borough housing scheme and the Norwich Mile Cross scheme. Other exhibitors were Messrs. A. F. Scott & Sons, Messrs. Morgan & Buckingham, Messrs. Olley & Haward, Messrs. Buckingham & Berry, Mr. S. G. Livock, Mr. Albert C. Havers, Mr. E. J. Tench, F.R.I.B.A., and Mr. J. O. Bond, Lic.R.I.B.A.





Sports Pavilion, Ilford, for the Port of London Authority.

THE ROYAL ARCHÆOLOGICAL INSTITUTE

ANNUAL MEETING.

By H. J. D. ASTLEY, M.A., Litt.D., F.R.Hist.Soc.

The annual meeting of the Royal Archæological Institute was held at Norwich from July 25 to August 1. Owing to the death of Sir H. H. Howorth, the presidency of the meeting devolved on Mr. W. Heward Bell (President of the Wilts Archæological Society), and the post of Honorary Secretary was ably filled by Mr. L. G. Bolingbroke, a well-known local antiquary.

Civic Reception.

On Tuesday morning a civic welcome was given to the visitors, who numbered about 100, at the Guildhall, by the Lord Mayor of Norwich (Sir George Morse), who was accompanied by Mr. Arnold Miller (Town Clerk) and Mr. J. H. F. Walter (President of the Norfolk and Norwich Archæological Society). Mr. Heward Bell suitably replied.

After seeing the Corporation plate—a fine collection—the crypt and other features of the Guildhall, the visitors proceeded to St. Peter Mancroft Church, where an address was given and they were conducted round by the Rev. Canon Meyrick, the vicar.

Norwich Cathedral.

The afternoon was occupied by a visit to the cathedral, where the party were received by the Dean. An address was given by Mr. A. Hamilton Thompson, F.S.A., who exhibited plans of the building and discussed its history and architectural details. The address was particularly interesting from the fact that the lecturer broached the question as to who actually built the cathedral. He said Norwich Cathedral was always associated with the name of Herbert de Losinga as its founder. But the life of a bishop was a strenuous one in mediæval times, and it was extremely unlikely that one in that position had the leisure or the training to do what must have required the application of a lifetime. The person really responsible for the plans of the building must have been the master mason employed by the bishop. We were accustomed to speak of certain changes as being due to the work of certain bishops. In his belief they were due rather to a change in the master masons. In process of time Norwich Cathedral had suffered many alterations, but in the Middle Ages these alterations were not, like modern alterations and additions, attempts to graft imitations of a dead style upon historical buildings; they were the work of artists who were still working in a living style, in sympathy with the social and economic conditions of their age.

A perambulation of the cathedral followed, under the guidance of the Dean, and the Bishop entertained the party to tea at the Palace.

Eleventh-century Village Churches.

In the evening a lecture was given in the room over the St. Ethelbert's Gateway by Professor Baldwin Brown on "English Village Churches in the Eleventh Century," illustrated with lantern views.

The lecturer explained that his remarks would be confined to the central period of the century, and would deal specially with the Saxo-Norman overlap, by which was meant the appearance in the same building of Saxon and Norman features. The theme had been selected partly because that "overlap" was represented in a large number of East Anglian churches. It was, of course, rarely that one met with a building presenting the same style throughout the existing fabric. The village church as they knew it was generally the work of the centuries from the thirteenth to the twelfth, but it commonly bore traces of older woodwork of the twelfth and even the eleventh, while between two and three hundred examples up and down the country contained work that carried them back to the Anglo-Saxon period. The great majority of mediæval churches were, indeed, of Saxon foundation, though the fabric of them might have been completely reconstructed. Hence the examples noted, though regarded specially from the standpont of the eleventh century, presented themselves as illustrating the village church in general, always mediæval, though representing more than one century. Built originally by the local lord or squire, but for the common use, at first probably of wood, but later rebuilt in stone, enlarged by the Normans after the Conquest, altered, added to, refitted, from age to age, the church had come down to them as the dominant feature of the settlements, rural and semi-urban. In all Europe there was no class of monuments more full of varied interest than English country churches, for, belonging on the one hand to the great, and on the other hand to the simple, they enshrined a large part of the social history of the land. The Saxons had their own repertory of constructive and ornamental forms which was quite different from that of the Normans. Characteristic Anglo-Saxon marks, none of which was used by the Normans in their own Duchy, were: (1) Double-splayed windows; (2) pilaster-strips, narrow, upright bands of stonework, not buttresses, but decorative enrichments of walls; (3) similar projecting strips surrounding openings; (4) double openings in the belfry stages of towers divided by mid-wall shafts; (5) the special treatment of corners of structures and jambs of openings called popularly "long-and-short work." The Normans had also their characteristic forms and methods, and the relation between the two sets of forms when they occurred in the same building required careful investigation. The lecturer, in conclusion, remarked on the interest of the study of the buildings of this period as casting a light on the historical situation after the Conquest. It was a fact, worthy of special attention, because on general grounds it would not be anticipated that certain Anglo-Saxon schemes of planning and details were taken over by the Normans and became established features of post-Conquest architecture. That Norman and Saxon worked together on the churches, and that, at any rate at first, the Saxon influence was on the whole predominant, was not without its historical significance, and was a rebuke to those old-fashioned scholars, if any survived, who still believed that architecture, with all the other elements of civilisation, was introduced into Great Britain by the Norman invaders.

Wymondham.

Wednesday morning was spent in visits to Wymondham, Attleborough, and Hingham; the afternoon to Caistor Camp and Carrow Abbey.

The first stop was made at Wymondham, in order to see the magnificent remains of the Abbey Church, of which only the nave, used as the parish church, and the central and west towers, still stand. William d'Albini, a great landowner in Norfolk, founded a priory at Wymondham in 1107 for twelve monks of the Benedictine order, as a cell of St. Alban's. In 1448 it became an independent Abbey. The original church, which consisted of nave, with north and south aisles, a Galilee porch at the west end between two western towers, transepts with central tower, and presbytery with north and south chapels, was completed about 1130. In the thirteenth century the choir was extended eastward. In 1400, the Norman central tower having become decayed, the present octagonal tower was built on the original crossing. In 1445 the two western towers were pulled down and the present west tower erected.

Attleborough.

Attleborough Church, described by Mr. A. B. Whittinghame, was originally a cruciform structure of the Middle Norman period, of which only the central tower remains. In the fifteenth century the nave and aisles were rebuilt, but the window-tracery could be taken for Decorated work apart from its mouldings. The rood screen of this date, which crossed the nave and aisles without a break, still exists, though, unfortunately, it has been removed to the west end of the church. Mr. Agmer Vallance described it as a magnificent specimen, and typical of Norfolk screen work, richly decorated, painted and gilt, but the tracery somewhat poor and flimsy. It was the finest example he knew, except that at Ranworth, and he hoped it might be restored ere long to its proper position.

Hingham.

Hingham Church was next visited. This is a fourteenth century church, having been built by Remigius de Hethersett, who was rector from 1316 to 1359. The east window is filled with German glass of about 1500, and contains figures of St. Anne, the Madonna, and Saints. There is a fine table tomb with canopy over to Thomas, Lord Morley, who died in 1435, and his wife. It is interesting to remember that Abraham Lincoln was descended from the Lincoln family of Hingham, and a bust of the President has been lately presented to the church by American citizens.

Caistor.

When the visitors arrived at Caistor the Rev. Dr. Astley gave an address on the Camp. He adduced reasons for holding that Caistor is the *Venta Icenvrum* of the Ninth Irer of Antoninus, and not Norwich, as some Norfolk antiquaries mistakenly hold; and explained *Venta* as being derived from Lat. *vendere*, to sell, and meaning, therefore, "the market-town of the Iceni," similarly to *Venta Belgarum* and *Venta Silurum* in Britain, and a host of Ventas in Spain and Portugal to this day. The Camp is about 34 acres in extent, strongly walled on pre-Roman foundations, and with towers at intervals, erected in the third century. One of these has lately been excavated under the supervision of the Rev. J. W. Corbould-Warren, the owner of the site; but the whole area awaits systematic excavation. The "finds" of coins, jewellery, pottery, and other articles are endless; the coins show continuous occupation from Nero to Gratian.

Carrow.

At Carrow Abbey Mr. B. Cozens-Hardy (Hon. Secretary, Norfolk Archæological Society) told the story of the house. Carrow was founded in the reign of Stephen as a Priory of Benedictine nuns, and was famous, as long as it endured, as a training school for Norfolk ladies. It was suppressed in 1536. The church and conventual buildings are all in ruins, but the results of Mr. J. J. Colman's excavations in 1881 may be seen. The present mansion was originally the Prioress's lodging, the older portion consisting of the hall, the parlour (panelled in dark oak), and the bedrooms above. It was built by Prioress Isabella Wygun early in the sixteenth century. The mantelpiece in her parlour bears her rebus, on one side the letter Y, on the other a gun.

In the evening a reception was held by Mr. and Mrs. L. G. Bolingbroke in the Strangers' Hall, their former home, now generously gifted to the city. A detailed history of the building was read by Mr. Bolingbroke, and its rooms and various contents, which form a veritable civic museum, were inspected.

Great Snoring.

Thursday was set apart for a tour in N.W. Norfolk.

The first place of call was Great Snoring, near Fakenham, where the rectory and church were described by Mr. John Page, A.R.I.B.A. The rectory takes its place with East Barsham Hall in the same neighbourhood as two remarkable examples of Early

Renaissance or Tudor architecture. Great Snoring rectory was originally a manor-house erected by the Shelton family, whose rebus, a "shell" and a "tun" is inscribed in a scroll over the entrance door. There were originally two corner turrets, of which only one now remains to its full height. These show the influence of Gothic which still survived. The two upper stages are of richly-traceried terra-cotta work, and a rich band of terra-cotta shields and lozenges, with the arms of the Sheltons, and the letters MIHC, *i.e.*, "Mary and Jesus" below, continuously repeated, runs the whole length of the east and south sides.

Binham Priory was next visited, where Mr. F. E. Howard described the church (of which only the nave with its fine Norman interior and beautiful Early English west front remains, as at Wymondham), and the ruins of the conventual buildings. Mr. A. Hamilton Thompson gave the history of the Priory. It was founded, according to Matthew Paris, about 1093 by Peter de Valoin, as a cell to St. Alban's Abbey, and the eastern part is of that date. The west front was rebuilt by Prior Richard de Parco between 1225 and 1240, and is a very fine example of the work of the period. The south aisle disappeared long ago, but the north aisle was only removed early in the last century, when the arcade was bricked up and some of the original fifteenth century windows of the aisle were inserted. The ruins of the western windows of north and south aisles remain, that on the north being one of the earliest examples known of a window with a transom.

The morning concluded with a visit to the so-called "Danish" Camp at Warham, where on the slopes of the circumvallations the Rev. Dr. Astley set forth such facts as are now generally received. This so-called Danish camp, he said, was situated two miles south-east of Wells. It stood on the slope of a hill, and in a bend of the river, some 60 ft. above the sea-level on the north-east side, while that part adjoining the river was some 30 ft. above the sea. The entrenchments were strong, being composed of chalk overgrown with turf, but the position was naturally weak, as on the north-east side the land outside was higher than that within. The ground covered by the earthworks and camp was approximately nine acres, the interior space alone about three and a half acres. There were two ramparts; the inner one over a quarter of a mile in circumference. In 1914 excavations were undertaken, in the course of which definite evidences of Roman occupation were found, and also slight indications of the presence of late Celtic pottery; but the earliest date of Warham Camp had not yet been ascertained. There seemed to be no evidence of Danish occupation, but it had been the fashion to call this camp and others in the neighbourhood Danish, through the known fact of the invasion of East Anglia by these pirates of the North Sea.

Lunch was partaken of at Wells, after which the Walsinghams were visited.

Great Walsingham Church.

Great Walsingham Church, in structure and proportion is a splendid example of the Norfolk village church. It is at some points in a deplorable state of disrepair. Mr. F. E. Howard said the church dated from the fourteenth century, with the exception of the south porch which was built a hundred years later. The chancel had long been in ruins. The window tracery throughout was exceptionally beautiful and might be instructively compared with Beeston-next-Mileham. The roof appeared to be rather later than the walls; and that of the nave was arch-braced and was of exceptional construction. The benches were of the early sixteenth century; the pulpit was probably of the fifteenth; the font cover and the altar rails were of the seventeenth. The remaining fragments of stained glass were coeval with the windows. There was a consecration cross on the south wall.

Walsingham Priory.

Speaking at Little Walsingham Priory, Dr. A. Hamilton Thompson described it as one of the greatest scenes of pilgrimage in the Middle Ages. The place was spoken of as Walsingham Abbey, the term abbey being commonly used even where houses were actually ruled not by abbots but by priors. This house of Our Lady of Walsingham was founded some time in the twelfth century. The fame of the house was due to the fact that it possessed a celebrated shrine, a wooden shrine having two doorways, so that worshippers could come in by one and go out by the other, said to be in imitation of the Holy House of Loretto, from which, it was said, the body of Our Lady was translated in 1291. There were still in existence two important chapels which were used as stations by pilgrims on their way to Walsingham; one was the Red Mount Chapel at King's Lynn, built about the beginning of the sixteenth century, and the other was the beautiful fourteenth century chapel between Walsingham and East Barsham, called the Slipper Chapel, because it was at this point, in all probability, that the pilgrims took off their shoes before approaching the sacred place. The Priory of Austin Canons, founded on the site of an earlier chapel of the Blessed Virgin about the middle of the twelfth century, was entered by a fifteenth-century gatehouse in the west wall of the precinct, adjoining which were remains of the almonry buildings. The church stood on the north side of the cloister, and was of an unusual plan, a long aisled building without transepts, and with an aisleless bay projecting at the east end. The east wall, with very beautiful early fourteenth-century detail, remained; the gable was rebuilt and a large window inserted in the fifteenth century. There were also remains of the western piers of the nave. On the north side was a small chapel, projecting from the north wall, and a large projecting building further west, which appeared to have been the *novum opus*, built in the fifteenth century to hold the celebrated shrine. The south part of the eastern range of the cloister, including a passage through the range, and the common house or dormitory sub-vault, remained. The latter, with the vaulted passage between the dormitory and refectory, was included in the modern house. Much of the south wall of the refectory, with its pulpit and stair, was left; the west wall and gable, the doorways of the screens at the west end, and portions of the north wall also remained. The west range, which probably contained the cellar with the prior's guest hall and great chamber above, had disappeared. Remains of other buildings to the south-east and south of the cloister, one of which was probably the infirmary, were incorporated in the modern house. There was some ancient work in a gateway, called the Knights' Gateway, to the north-east of the priory. The holy wells, east of the church, were approached by a beautiful archway, c. 1200, which was removed here from one of the destroyed buildings.

The Greyfriars, Walsingham.

Of this picturesque building Dr. Hamilton Thompson remarked that it consisted of two courtyards. The smaller court, on the south, was entered at the south-west corner, and had covered passages with rectangular traceried windows on its east and west sides. The east passage might have communicated with the infirmary and other offices, of which there were traces on the east and south sides. The passage on the west led to the cloister court, on the north side of which was the church. Of this and of the eastern cloister-range there were only fragments, and little was left of the refectory; but the walls and gables of the western range were left and showed that it was of unusual size. The friary was founded in 1346; but the remains, so far as their date could be identified, seemed to belong to the next century.

East Barsham.

East Barsham Hall, built by Sir William Fermor, 1512-1515, and now being judiciously restored by its present owner, Mr. W. C[o]man, under the supervision of Mr. M. Pa[g] was also visited. Here the Italian influen[ce] is even more pronounced than at Great Sn[o]ing Rectory. Pietro Torrigiano, or Peter T[o]risan, as he was called in England, w[as] was entrusted by Henry VIII with the er[ec]tion of Henry VII's tomb at Westminst[er] was probably the designer of the ornamen[t]tion on both houses.

Norfolk Rood Screens.

The evening meeting was held at St. Eth[el]bert Gateway, when Mr. F. E. Howard [de]livered a lecture on Norfolk screens, ill[us]trated by many lantern views. Mr. How[ard] said, considering the artistic merit of [the] mediæval screens of Norfolk, it was amazi[ng] that so little had been written about the[m]. Many of them were in an appalling conditi[on] and some appeared to be regarded simply [as] lumber by their custodians. There were ab[out] 650 churches in Norfolk, and 250 of these [or] thereabouts had screens. The lecturer fi[rst] dealt with the screens of the fourteenth c[en]tury, and pointed out that there were t[wo] chief types, one in which the tracery was s[up]ported by a series of turn shafts, and [the] other with the uprights treated as pinnac[les]. The Norfolk screens of the fourteenth cent[ury] were notable for the beauty of their trace[ry] especially the roses or wheels over the do[or]ways. The fifteenth-century screens fell i[nto] two groups—the square-headed, which h[ad] coved or flat soffits to the rood loft, and [the] arched screens, which were vaulted. T[he] screens at Ranworth and Attleborough w[ere] particularly fine specimens of fifteenth-cent[ury] screens, and the lecturer drew particu[lar] attention to the remains of the rood loft [at] Fundenhall and also of that at Tottington.

The tour on Friday comprised a trip [by] motor-launches on the Norfolk Broads, a[nd] with the exception of the visits to Ranwo[rth] and Ludham, it partook more of the nat[ure] of a holiday excursion.

Mr. Heward Bell having been compelled [to] leave, the Presidentship was assumed by M[r.] A. Hamilton Thompson.

Ranworth.

At Ranworth Church Mr. F. E. How[ard] suggested that in Norman days there was [a] long and narrow church, consisting of n[ave] and chancel. The present chancel retai[ns] certain windows of the fourteenth centu[ry] but they seemed to have been re-used in [the] rebuilding or remodelling of the late f[our]teenth century or early fifteenth. Instead [of] adding aisles to the Norman nave, as wo[uld] have been done in other parts of Engla[nd] the builders of the early fifteenth century [had] built a huge structure, comprising, as it w[ere] nave and aisles in a single span. They [had] added a western tower and north and s[outh] porches. A double hammerbeam roof [is] known to have been destroyed by faculty [in] 1705. Probably the font cover, of whic[h a] fine drawing remained in the church, [was] destroyed about the same time. The fitt[ings] were of the greatest interest. Besides a [fine] set of backless benches, disfigured in mo[dern] times, and considerable remains of the [old] stalls, there remained a most interesting [old] lectern, with desks at different heights. [The] rood screen was perhaps the most beau[tiful] though not the most elaborate, in Nor[folk]. It extended right across the wide nave, [the] side sections being treated as reredoses [to] the two side altars, with delightfully des[igned] wings to protect them. Though the s[creen] retained a larger portion of its loft, the gr[eater] part of its vaulting had been destroyed. [The] portion which remained was exqui[sitely] painted with floral sprays. Nowhere els[e] the arrangement of the side altars be[en] beautifully preserved as here. But [the] arrangement of side altars and reredos w[as] unique in Norfolk. It was merely an ex[ample] of quite a common thing. The scre[en] would date at 1450 or 1460. It did not [stand] alone as regarded style. There were [other] screens about here which were the w[ork] the same hand. The style of the side r[ood]

as very much like a screen at Gooderstone. he restoration of the screen had hardly been appy, but so far as he knew nothing old had een destroyed. It was an interesting ques-on as to whether the painting was contem-orary with the screen, and whether it was he work of the same craftsman. He thought ot, for he knew of three other screens dis-nguished by work evidently from the same ever hand.

Ludham.

Mr. F. E. Howard's address on Ludham hurch stated that the chancel, of the first alf of the fourteenth century, was probably rebuilding on a much larger scale of the iginal Norman chancel. The west tower, ther later in style, must have been com-enced quite clear of the older church. The ne aisled nave dated from the late fourteenth early fifteenth century. The eastern four ays appeared to have been built first, the ork being then extended to link up with the estern tower. The roof of the nave was a ammerbeam example, relying for its stability its long wall posts, which transmitted the rust to the aisle roofs; these were of the me date and of flying buttress form. The ancel roof was modern. Of the fittings, e most important was the rood screen, ted 1493, retaining its original colour, in-uding a fine series of saints on the lower nels. Above the screen was a mediæval mpanum, discovered in recent times in the od-loft stairway. The actual painting prob-ly dated from Marian times. Within the ancel were simple but dignified returned alls on their original platforms. There was interesting chest and a plain and massive ms-box. The font was a good example of e usual Norfolk type, with alternate evan-elistic symbols and lions.

In the evening the visitors were the guests the President and Committee of the Norfolk d Norwich Archæological Society at a recep-on held in the Keep of the Castle Museum.

Beeston-next-Mileham.

On Saturday the visitors saw some of the ost interesting remains Norfolk has to show. he tour was in the district which the late r. Jessopp called the "Norfolk Holy Land" om the profusion of monastic houses to be und in it, *i.e.*, Castle Acre and the neigh-ourhood. The first stop was made at eeston, which Mr. F. E. Howard described "one of the most delightful structures of s kind in Norfolk," and "beautifully pre-rved after 500 years of neglect." There as originally a Norman aisleless church and ancel: the chancel was rebuilt about the ar 1310, the nave somewhat later, and it this fourteenth-century church that we see -day. The flowing tracery in the windows is aracteristic. The parclose screens, of both rth and south chapels, at the east end of e nave, are well preserved, an unusual cir-mstance; some of the "choir-stall-like" ting remains. The southern screens date m 1400; the northern about 1475. The ancel screen is well preserved, the rood loft ne. The painting is original, and remark-le for its "landscape" instead of the usual per background. The church possesses a e-Reformation paten.

Great Dunham.

We next arrived at the church of Great nham, considered by Professor Baldwin own to be one of the most interesting mples of late-Saxon work in the country. has all the features of pre-Conquest work igh fenestration, central tower, triangular-ded west door (now blocked up), long and rt work, very pronounced, and arcading. e latter in this case is interior, and may compared with that at Bradford-on-Avon, ich, however, is there exterior. The wall-is thick for the period. The windows are ble splayed. In the tower there are small ular openings, which is an Anglian fea-e and a mark of late pre-Conquest work. belfry windows are divided by a mid-l shaft with cushion cap.

Swaffham.

The interesting fifteenth-century church at Swaffham was next visited, and an address given by the Vicar, who exhibited some of the treasures of the church library, among them the famous "Black Book of Swaffham," an early Vulgate, and a beautiful little fifteenth-century Book of Hours.

Castle Acre.

After lunch the party proceeded to Castle Acre, where Dr. Astley described the earthworks and gave the history of the Castle; Mr. F. E. Howard said all that was necessary about the church; and Mr. A. Hamilton Thompson gave a *résumé* of the history of the Cluniac Order, and a description of the Priory, with the aid of Sir W. St. John Hope's excellent plan. All these may be found in Dr. Astley's "Guide to Castle Acre."

East Dereham.

On the return to Norwich a halt was made at East Dereham for tea and a brief inspection of the church to view the Seven Sacrament Font, much mutilated, and the Cowper Monument. The Vicar read an extract from the old church account-book, showing that the whole cost of the font in 1468 amounted to £12 13s. 9d., of which the stone cost £1, and the mason "for workmanship of the seyd funte" was paid £10.

The tour on Monday took the members to North Norfolk, where the churches of Sall, Cawston, Cley, and Blakeney, and the historic Blickling Hall were visited.

Cawston.

The first halt made was at Cawston, where an inspection of the church was made. Its chief features of interest were described by Dr. A. Hamilton Thompson. The chancel was built in the early part of the fourteenth century. About 1400 the west tower was built largely of freestone, on a site clear of the building. The chief interest of the church is its hammerbeam roof, remarkable for the tall figures of angels set in front of the struts between the hammerbeams and principal rafters. The screen, of the characteristic local type, has a series of painted panels. There is a large wall painting with a defaced inscription on a scroll in the south transept, which also has a ceiling with well-painted bosses. The ringers' loft in the tower remains. The church has a fifteenth-century pulpit.

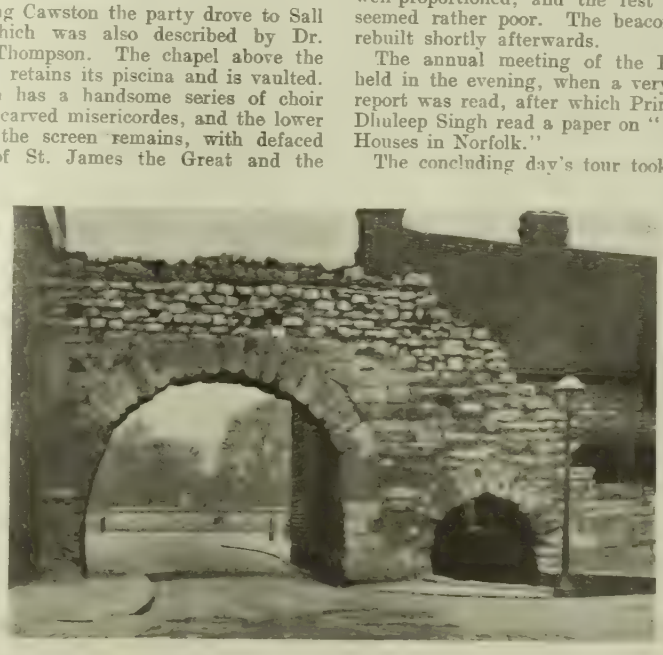
Sall.

On leaving Cawston the party drove to Sall Church, which was also described by Dr. Hamilton Thompson. The chapel above the north porch retains its piscina and is vaulted. The church has a handsome series of choir stalls with carved misericordes, and the lower portion of the screen remains, with defaced paintings of St. James the Great and the Latin Fathers and remnants of the Nicene Creed painted on the sill above.

Blickling Hall.

Leaving for the time being the study of churches, the visitors went on to Blickling Hall, built by Sir Henry Hobart in 1620 on the site of an earlier house erected by Sir Nicholas Dugworth. A paper on the history of the hall and its chief features of interest was read by Canon Meyrick, who has long and intimate memories of the hall. The party spent some time in going through the rooms and gardens.

Cley.



At Cley Mr. A. B. Whittingham dealt with the architectural features of the church. It was during the fourteenth century, when Cley was a flourishing port, that the rebuilding of the church took place, but on a more magnificent scale, and it is for the work that was then done that the church is famed. A clerestoried nave was built wider than before. On each side broad aisles were made, with transeptal chapels at their east end. In the fifteenth century new windows and roofs were given to the aisles and chancel, and three porches were added. The south porch is a fine piece of work of 1400. In the room above is a rare contemporary iron-bound chest for the church valuables. The pulpit is dated 1611.

Blakeney.

The last place visited in the day's tour was St. Nicholas' Church in the adjoining village of Blakeney. Mr. A. B. Whittinghame acted as guide. He pointed out that the church was chiefly remarkable for its two towers, there being a small beacon tower at the north-east of the chancel in addition to a large one at the west end. The building was all of two dates. The Early English chancel was vaulted in two bays. Its east window was of seven lancets, but the three-light side windows had given way to others of Perpendicular date. At the east end a space was walled off to form a sacristy, and from this a stair ascended to the beacon tower and the space above the vault. The rest of the church was entirely rebuilt in the fifteenth century. The rebuilding commenced in 1434. This work consisted of a clerestoried nave with aisles, north porch, and west tower, the west bay and tower being a little later than the rest. Internally the building was quite pleasing with its hammer-beam roof, but externally the tower was not well-proportioned, and the rest of the work seemed rather poor. The beacon tower was rebuilt shortly afterwards.

The annual meeting of the Institute was held in the evening, when a very satisfactory report was read, after which Prince Frederick Dhuleep Singh read a paper on "Some Manor Houses in Norfolk."

The concluding day's tour took the visitors

The Newport Arch, Lincoln.

[This arch is probably the oldest of its kind in the Kingdom still serving its original purpose; it was built by the Romans.]

into East Norfolk, so that we may say that they have not left unsampled any of the best things which the county has to show of its wealth of antiquarian objects of interest.

Barton Turf.

At Barton Turf Church Mr. Arthur B. Whittingham explained that the church, which was mentioned in Domesday Book, was enlarged early in the fourteenth century by the addition of the present aisles and chancel. Later in the same century a small clerestory was built. Early in the fifteenth century various improvements were made. A new rood screen was erected at this time, which now formed the chief feature of the church. The paintings on its twelve lower panels represented the nine heavenly orders. At the east end was a painting of the descent of Christ, said to be by Van Dyck.

Tunstead.

At Tunstead Church Mr. Philip M. Johnston, referring to the fabric as the stately church of a vanished town, said the church is remarkable for its size, the internal measurements being: Chancel, 51 ft. 4 in. by 25 ft. 3 in.; nave, 87 ft. 2 in. by 24 ft. 10 in.; and aisles, co-terminous with the nave, 14 ft. 1 in. wide. As Tunstead gave the name to the Hundred, it was probably in Saxon times the capital town in it. There are records of walls, gates, and important houses and holdings, indicating a town of some size and importance, of which nearly every trace has vanished.

Worstead.

With regard to Worstead Church, which was next visited, Mr. Johnston said this church occupied about the same area as Tunstead Church, but while its chancel was wider and much shorter, it was flanked by important chapels, and that on the north had an original two storied sacristy to the eastward—a comparatively rare feature locally. The church was exceptionally rich in painted screens. The rood screen of ten openings retained its vaulted cove, and was erected between the years 1512-24.

From Worstead the party went on to North Walsham, where they looked round the church.

Bromholm.

On leaving North Walsham the party drove to Bacton for the purpose of inspecting the remains of Bromholm Priory. The Priory was founded in 1113 for a few Cluniac monks, and the Priory church was dedicated to St. Andrew. The oldest portion of the present remains is a block standing apart from the rest, which formed the north transept of the Priory church. The date of this portion is of the close of the twelfth century. The ivy-clad remains of the Priory offer many points of interest to the antiquary.

Mr. Johnston read a paper on the Priory written many years ago by Mr. Harrod, a former secretary of the Norfolk and Norwich Archæological Society, and added some account of his own of the Cluniac order of monks. In concluding his remarks he said the owner had expressed his readiness to permit any competent body to undertake the excavation of the site.

Dr. Hamilton Thompson, in referring to the ivy-clad condition of so much of the ruins, said that to talk about the beauty which clinging ivy gave to such ruins was purely an artificial idea. He did not think there was anything pretty about it. Ivy was extremely gloomy, and was fatal to stonework. If those ruins were to be properly preserved some means should be taken for removing the ivy from them.

Paston.

The visitors next drove to Paston, where the church was described by Mr. Herbert Loraine. The present edifice is not the original church of Paston. The existing building was erected early in the fourteenth century. It was restored notably in 1601, 1843, and 1869.

From the church the members passed to the manor barn, close by, which was built by Sir William Paston, whose tomb is in North Walsham Church. The barn is said to be the largest in the county.

The rest of the day's tour included visits to Mundesley, Trunch, and Knapton, which were described by Mr. Aymer Vallance.

Norwich.

On the last day of the meeting Mr. W. R. Rudd conducted the visitors to places of interest in the "City of Churches," including the "Great Hospital," with the cloisters, Eagle Ward, and Church of St. Helen; Bishop Bridge; Cow Tower; St. Andrew's Church; the Convent of the Black Friars, including St. Andrew's Hall (formerly the nave of the church), Blackfriars Hall (the former choir of the church), and cloisters; the City Bridewell (now the property of the city), and others—at all of which Mr. Rudd discoursed.

This brought a most successful week to a close. For the excellence of the arrangements all credit is due to Mr. L. G. Bolingbroke, who had also prepared a most attractive book of the programme, with plans of the principal buildings, full of information, to be carried away as a memento of the occasion. Thanks must also be accorded to all the organisers of the meeting, and to the various lecturers, whose descriptions added so much to the enjoyment and profit of the members.

SOCIETY FOR THE PROTECTION OF ANCIENT BUILDINGS.

"Isis" writes as follows:—

Sir,—The recent controversy over the western towers of Canterbury which has taken place between Canon Mason and the S.P.A.B. has set some of us wondering. I find myself gasping in a rather stifling air of outworn phrases and doctrines when reading letters of the Secretary of the S.P.A.B. We all recognise the excuses for the attitude of the Society lying in the immense injury done to ancient buildings in the past through so-called "restoration," but is it not becoming a little hysterical and out of touch with life when it fails to do justice to the changes in public opinion for which its own good work is so largely responsible? Instead of recognising these and keeping an open mind, it appears to have fallen back on the reiteration of generalities and theories, so remaining out of practical touch with things. Moreover, it has set itself to assume as concluded, as stated by the Secretary, that no modern material is to be used in repairs, as when he says: "Tinkering with stone surface is as harmful to old masonry as the addition of modern stained glass to ancient stained glass windows." This surely needs some qualification, for it is not the fact. The numberless pieces of "matted" glass inserted in the windows at Fairford, for instance, to fill the gaps in the original stained glass are largely modern, and, though better than incompetent restoration, greatly disfigure the windows. The spirit in which the repairs are made determine the results much more than whether the glass used for repairs is new or old. Nor can one for a moment accept the view that in no circumstances should repairs include the restoration—in the right sense—of the original. The confusion seems to have arisen through the abuse of bad restoration, which has reacted on the S.P.A.B. in the form of fixed ideas which mutilates its influence. It is quite open to question—though each instance must be judged on its merit and not by the imposition of fixed dogmas—whether the insertion of patches of matted glass, otherwise unpainted, in a painted window is at all satisfactory; nor is it the best that can be done. If it were possible it is certainly better to renew, in sympathetic treatment with the original window, the missing pieces—and why not? The cry of "forgery," where no forgery is intended is beating the air, and the "falsification of history" only a grand ose commonplace. To give the ancient windo more of its original appearance, to restore i beauty, is much more important than suc history. Nor do I suggest that in the case a largely perished window such restoration desirable or possible, but in those cases whe the repainting of a few pieces of the missing gla would complete the effect again it is of ever advantage to repaint them. And it can b done when these matters are not regarded a matters of repair unworthy of an artist attention, and the artist himself direct them. I have recently seen such repair executed in the way I describe, wholly sym pathetic and successful—much more successfu than the purism that replaces the lost piece with patches of new matted glass. I hold ther can be no deception where there is no intentio to deceive, and history may well, in such case, yield to beauty, though no such yieldin is really involved. And so with regard to ston work, it is the craftsmanship much more tha the new stone that arouses objection to repair made in such a way. It may be answered tha sympathetic modern stone work is not obtain able. I doubt the truth of this, but were it s it does not make it undesirable, or, on the othe hand, justify this superstition about old work as though it were something not wrought b human hands which we must superstitiously worship. More alive to the need of the times we should seek in such repairs for a treatmen of the stone work more in sympathy with th old—and then, perhaps, "patches of hard edged new stone" would not occur, and re incarnation would more truly describe th results obtained. One has the feeling that th constant reiteration of outworn phrases abou "forgery," "falsification of history," an "puerile imitation" does not help at all, an that their tendency is to harden into dogma to the undoing of a good cause.

"SUGGESTED SANITATION."

A correspondent ("Experimentia") writes:—

Sir,—We can increase the preservation o our health in all sewered towns in an economica manner, varied to circumstances, by naturall and mechanically inducing the air flow into th sewers, using every existing surface ventilato as an induction port, whereby all spores, insect dust, bacteria, and deleterious air, &c., a driven into the sewer flow, and if desire through water spray, or a destructive jet flam thus greatly mitigating fog. This schem particularly applies to London.

Even the energy in sewage gravitation some points may be used to drive the loc propeller under control. Seaside towns, su as Brighton, could also flush their sewers wi sea-water, and repeatedly use the gravitat water energy for ventilated induction as f as the outfall. Bureaucracy seldom initiate we are burdened with academic coat and theo I think we can apply some such practi effort, which could be gradually adopted small units and sections to a concerted whe It has also the merit of a remunerative p position in its broad aspect.

Housing in Glasgow.

Under the new Rent Act vacant hou became automatically decontrolled, and question arose whether these houses would be at an increased rental. "There are,' st a Scottish contemporary, "probably vacant houses in Glasgow, but several are la houses with rents from £90 to £300. Ot houses, again, are not in a fit state for habitat The City Assessor's Department had a list 100 empty houses ready for occupancy w rents running from £10 or £12 to £80. Inq shows that, with two exceptions, these ho are being let at the former rents, and betw twenty and thirty are tenanted. Some of vacant houses, it is understood, are being off for sale."

Greek Composition.

Design by Mr. D. E. Harrington (1st Year Student), Awarded First Prize, Day School of Architecture, Northern Polytechnic.

BOOK REVIEWS.

House and Cottage Construction. Vol. I. By H. Bryant Newbold, M.S.A., with special chapters by Guy Cadogan Rothery, Paul Willoughby, F.S.Arc., E. W. King, G. J. Strange, and A. C. Martin, A.R.San.I. (London: Caxton Publishing Co., Ltd., Surrey-street, W.C.2.) Price 58s. 6d. the set of three volumes.

Mr. Bryant Newbold, in his book on "House and Cottage Construction," covers a much wider field than is usually the case with text books on this subject; he aims at laying before his readers enough general information to render them at the least intelligent and sympathetic critics of the architect's endeavours. In this connection his quotation from H. G. Wells' description of a writer's efforts is very apt. Like the writer, the architect has to revise continually his earliest ideas before a thoroughly satisfactory effect is produced. "The actual operation described by one well-known architectural designer as 'fooling about' consists of roughly blocking out the rooms required, having due regard to the conditions of site, &c. Over this rough drawing a piece of tracing paper is placed, and the whole thing gone over again. This operation is repeated, and repeated, until every possible solution has been tried, and the best has been found. So out of the 'slush' by 'fooling about' arises the finished article. And here a plea on behalf of the designer may be made. Should the client, in discussing the final sketch plans, find his architect somewhat irritable when faced with some brain wave by the client, the client will perhaps regard his irritation more leniently when he learns that the designer has spent perhaps several hours in considering this very brain wave in the fooling about process or slush stage."

It is this constructional meditation which marks out the expert designer from the novice. A design must be considered in relation to its site, its sanitation, its aspect, its subsoil, the position of the entrance drive, before the position of a single wall can be determined. Even at a later stage the design will probably have to be reconsidered again, remodelled in fact, to bring it within some stipulated limit of cost.

Mr. Newbold's criticism of the plans designed by a lady, on pp. 105–7, are very much to the point. The designer was obviously ill-equipped to deal with the necessary processes of revision or even to visualise the inconveniences of working in or even staying as a visitor in such a house. It is impossible for the amateur to have in mind all the many factors of convenience, construction and appearance that have to be combined to produce a work of architecture. A good housewife may and should know how to describe her chosen method of work to her architect in order that he may arrange the rooms in convenient positions to avoid loss of time, wasted space and needless wandering about the house, but this knowledge is the function not of an architect but of any good client who may reasonably be expected to explain the purposes of his business before requiring an architect to design premises to accommodate it.

The fact remains that neither housewives nor business men take sufficient interest in ascertaining what their own views of convenience really are, and Mr. Newbold will have done a notable service to architecture if he directs attention to this aspect of design based upon the practical necessities of the case.

Passing from the consideration of convenience to the consideration of beauty, the value of homogenity is very rightly emphasized. The stringency of the cost of building since the war has done something to help architecture to avoid needless fussiness due to the capricious employment of discordant methods, materials and colours in the same building, but the compulsion which has sometimes led to the erection of simple and suitable buildings will often result in the production of merely mean ones which inspire again a desire for detail to break the monotony as soon as times are easier and funds permit. The plainness of domestic architecture at the moment is a virtue derived from compulsion and Mr. Newbold does well to endeavour to establish it upon a basis of rational choice. The details and fittings of houses and cottages are explained with great care and many excellent constructional devices whereby convenience can be made to go hand in hand with economy are illustrated in clear diagrams. Without necessarily agreeing with Mr. Newbold in all his personal preferences, the reader will certainly feel that nothing has been advanced from caprice, and that honest conviction and sound reasoning underlie the treatment of each detail of house and cottage construction contained in this useful and comprehensive book.

Modern Cabinet Work: Furniture and Fitments. By Percy A. Wells (Head of the Cabinet Department at L.C.C Technical Institute, Shoreditch; Silver Medallist Royal Society of Arts) and John Hooper, M.B.E. (Honour Silver Medallist, City and Guilds of London Institute). 3rd edition, revised, with additional illustrations. (London: B. T. Batsford, Ltd., 94, High Holborn) Price 25s. net.

So much is heard of antique furniture, the imitation of it, or the cunning tricks of the worm-hole artist, that it is a pleasure to find an excellent and authentic book on modern cabinet work reaching its third edition. It is difficult in a period of unrestful eclecticism to rival the productions inspired by an unbroken tradition when furniture and fittings were designed by masters imbued with a feeling for

A Cabinet in Coromandel and Satinwood: Designed at the School of Arts and Crafts, and made by Mr. J. H. Brandt.

ateliness throughout a whole scheme, but some the modern work illustrated demonstrates at new designs need not be in any way inferior the old. (Plate xix.) A cabinet in coromandel d satinwood, designed at the L.C.C. Central hool of Arts and Crafts, and made by J. H. andt, exhibits a mastery of the principles of lour composition in the disposition of the gorously figured material, and two pieces by W. Gimson, a sideboard veneered with rr elm and a print cabinet in Italian walnut th raised inlay, would be distinctly pleasant ms among one's household goods. Examples historical styles are introduced for the sake comparison, and beautiful as these unubtedly are, the present fashion for the tique at any price is hardly justified by any arth of good modern work. The constructonal side of the craft is developed with the sistance of a great number of illustrations here the intricacies of cabinet making are set rth in the most comprehensible manner. he methods for ascertaining the true dimenons of bevels and of splayed and curved surfaces r the preparation and fitting of veneers are aborated in a chapter on "Practical Setting ut and Applied Geometry." Theory and ractice are dealt with together; shrinkage is rovided for when the full-size setting out is ade.

In the description of the geometrical groundork of "an elliptical dome" the following ractical instructions are given: "Dry, well-asoned wood is, of course, an essential in this ork, and it will be found advantageous to ughly cut the segments to shape first, and hen allow them to stand about for some time ntil the shrinkage is quite complete before nally jointing and glueing up to shape." mong much other useful matter a chapter on Constructional and Decorative Brasswork. lovements and Fittings" is particularly aluable, and the book is brought up to date respect to material for cabinet making by he inclusion of a list of English, foreign and olonial woods with three plates showing anelling and furniture executed in various ustralian woods. The material for veneering also treated of in Chapter IX in connection ith the methods adopted in its application. A glossary of technical terms and an index omplete this useful work.

ixty-six Etchings by Members of the Print Society. Edited by Hesketh Hubbard, R.O.I., A.R.W.A. (Issued by the Print Society, Woodgreen Common, Breamore, Hampshire.) 21s. net.

It is a pleasure to look through this volume th its introduction by Mr. Kineton Parkes, hich is most interesting and instructive, pecially to those who have not the time, they have the inclination, to study thoroughly subject in which there is so much to be arned. Hints on framing, the display and care prints, mounts, &c., are dealt with, and that portant and mystifying term known as tates" is comprehensively explained and will lighten many. Etchings are receiving more ention of late years and well they deserve It is to be hoped that the days of the soled "furnishing pictures" are drawing to lose. So many a picture once on the wall, ually hung crookedly, is never looked at in; but once the taste for good specimens leveloped, great and refreshing is the pleasure ived from one's purchases.

t is pleasing to know that the Society is leavouring to advance taste for fine work, l this volume should help the novice and ector in making a choice; the specimens strated deal with varied subjects and will peal to all tastes. To become a collector mber is a simple matter. The merits of the ts illustrated are high, which make it icult to select any for special mention, we may mention some half-dozen. No. 1, nshine and Shadow," by Wilfred Applebey; ew of a quayside or harbour, taken between old buildings, effectively treated in sunt and shadow. No. 15, "The Trawler," Edward Charlton; a trawler putting to sea; sea in the wake of the trawler is beautifully expressed, the whole is characteristic in its expression. Plate No. 24, "The Harrow," by George Gascoyne, R.E., is another pleasing specimen. Plate No. 33, "The Three Mills," by Hesketh Hubbard, R.O.I., A.R.W.A., is a decorative subject poetically treated, and the composition well considered. Plate No. 53, "The Three Scythers," is another attractive plate. No. 68, "The Silver Stream," by E. Marsden Wilson, A.R.E. (mezzotint), makes a strong appeal with its beautiful cloud effects. Many others are worthy of notice. Through the courtesy of the Editor, we are able to illustrate Plates No. 1 and No. 33.

ANNUAL CONGRESS—II.

MODERN BUILDING MATERIALS.

Mr. H. D. Searles-Wood dealt with materials and methods of construction which, although not new in the sense of having been recently discovered, were not in general use.

Sand-Lime Bricks.—These bricks were manufactured in large quantities in most European countries with well-known success, and also in the United States of America and Canada, where large quantities had been made for years past, and so important had the industry become that the manufacturers had combined and founded a "Sand Lime Brick Association" for their mutual help and protection. The process solved to a great extent the problem of producing a brick of first-class quality in localities where clay was not available. In the manufacture of sand-lime or calcium bricks, sand and lime of a suitable quality were thoroughly mixed in approved proportion. When thoroughly mixed and brought to the desired constituency by the introduction of water, the mixture was passed into metallic moulds and subjected to mechanical pressure. As the bricks passed from the machines they were packed by hand and started on a trolley and run into a hardening chamber into which, after having been sealed, steam was admitted to the pressure of which the bricks were subjected for a sufficient period of time. Sand-lime bricks for many years past had been manufactured by a large number of firms in this country and it was confidently anticipated that the existence of a British Standard Specification would conduce to uniformity in practice and give confidence to the purchaser and the user.

It was of the utmost importance that the material used should be of the best quality obtainable. The sand selected might be bank sand, freshwater river sand, drift sand, or sand or sandstone crushed or an approved mixture of these. A good practical rule for fineness was that all the sand should pass through a sieve having 2,500 meshes per sq. in., about 85 per cent. retained upon a sieve having 10,000 meshes per sq. in. Generally speaking, the sand should consist of grains of assorted size, and so graded as to give the greatest density of material. When a coarse sand was used suitable means should be provided either before or during the mixing operations for reducing it substantially to the above fineness.

The most suitable lime was a high calcium lime containing 90–95 per cent. of calcium oxide and not more than 0.5 per cent. of magnesium oxide. The lime must be thoroughly hydrated before or after admixture with the sand; the ratio of the weight of dry hydrated lime to the total weight of dry hydrated lime and dry sand was usually not less than 7½ per cent. nor more than 12½ per cent. Whether the lime and sand be mixed by weight or by volume, care should be taken to see that (1) the required ratio of lime to sand was consistently maintained, and (2) that the mixing ensured the lime being disseminated thoroughly throughout the mass.

The average crushing strength when dry should be not less than the following:—Engineering bricks, 2,800 lbs. per sq. in.; bricks for external walls, 2,000 lbs. per sq. in.; bricks for internal walls, 1,000 lbs. per sq. in. The average crushing strength when tested wet should not fall below the figures specified for the first two classes by more than 20 per cent. and for the third by more than 30 per cent.

Concrete.—After referring to the different methods of concrete building construction, he said hollow concrete floors were now much used. In one system of this type of floor construction, instead of the usual collapsible core which was withdrawn after the formation of the hollow concrete slab around it, each of the floor units consisted of a pre-cast reinforced concrete beam formed around a perforated metal hollow core which was left permanently embedded. The beams varied from 12 in. to 16 in. in width and from 5 in. to 10 in. in depth, and were appropriately reinforced according to span between supporting walls or joists, and nature of load to be carried. The advantages were obvious. Instead of a centralised plant, establishment and transport charges, all the operations for the production of the beams could be carried out by any reputable contractor on the actual building site or at any convenient spot adjacent thereto. The metal for the cores was delivered cut to sizes in flat sheets, and by means of a simple apparatus was bent into the required shape. The main reinforcing bars—delivered cut to lengths—were attached thereto, thus giving a complete "coring and reinforcing" unit around which each beam was cast in moulds used repeatedly throughout the job. The fact that the metal cores were left permanently embedded gave each beam—and consequently the completed floor—additional strength and rigidity, whilst the whole process of production was simplified and rendered speedy and economical. The speed with which the floor could be erected enabled the general contractor and subsidiary trades to make rapid progress. The floor was much lighter than a solid floor of equal strength. A material saving in dead load was, therefore, effected. A further advantage—particularly in hospital, school, or commercial buildings—was the elimination of noise, in addition to temperature and fire-resisting properties.

The units could also be employed for flat roofs, external or internal walls, and partitions, stairways, landings, &c., the advantages of speedy erection, strength with lightness, sound and temperature resistance, applying as in the case of floors. With a slight modification, lintels and sills could be similarly produced, having a finish equal to the best masonry work, with a distinct saving in cost.

Another recent development was the manufacture of cast-iron pipes and concrete pipes by centrifugal action. In the manufacture of reinforced concrete pipes by the centrifugal method a thin sheet-iron mould was built up, inside which a spiral wire reinforcement was fixed. The mould was then placed on vertical rollers which caused it to rotate at a high speed. Suitable concrete was then thrown in and built up to the required thickness. The concrete became dense and the water was occluded owing to the influence of centrifugal force. After a few minutes' spinning, the pipes were placed in a steam bath and left for eight hours, when the concrete was sufficiently hard to allow the outside mould to be removed. The pipes were then placed in the open to season for four weeks. The effect of the spinning was to produce an extremely dense concrete which should effectively protect the reinforcement and give a thoroughly waterproof pipe. The pipes were normally tested up to 150 lbs. per sq. in. By the time the final spin had been completed, all the excess air and water in the concrete had been draining out by the action of centrifugal force. After the first spin the concrete mixture in the mould was so hard and dense that it was impossible to make an impression with the thumb on the side surfaces. Another interesting feature was that the centrifugal process imparted abnormally smooth internal surface to the pipes, thus reducing frictional losses to a minimum.

An interesting comparison was recently published concerning the external tests carried out on various stoneware and concrete pipes. It was a well-known fact that concrete increased in strength with age, which rendered the following comparison all the more remarkable: A concrete pipe, one year old, of 18 in. diameter, of 3 ft. length and of a thickness of 1½ in., was tested to a breaking load of 1,345 lbs., equivalent to a load of 2,448 lbs. per ft. run. That pipe was compared with another stoneware pipe, which gave under test 1,400 lbs. per lineal foot. The concrete pipe tested was non-reinforced, and only three weeks old, of the same diameter and thickness, but of 4 ft. length instead of 3 ft. A breaking load of 10,622 lbs. was applied, equivalent to a load of 2,656 lbs. per foot run, as against 2,448 lbs. and 1,400 lbs. respectively.

White Lead Paint.—The subject of lead poisoning amongst house painters had for many years been a matter of acute controversy, and a large number of Government inquiries had been carried out in various countries into the medical and technical aspects of the problem. There had been much difference of opinion as to the extent to which poisoning took place, and in particular as to how far symptoms frequently attributed to lead were to be more properly ascribed to other causes, such as the inhalation of turpentine and other volatile thinners. Discussion had also turned on the question as to how the danger of lead poisoning could be met, whether by way of regulations, in methods of use, or by prohibition of the use of lead paints. The all-important conclusion which had been generally agreed was that the chief cause of poisoning amongst painters was the inhalation of lead dust. The question was discussed at the third International Labour Conference of the International Labour Organisation of the League of Nations, which met at Geneva in October and November, 1921, and as a result of that discussion a Draft Convention was drawn up which was to be submitted for the consideration of the legislative authorities of the various countries which were members of the League of Nations.

The Draft Convention proposed regulations for the use of paints containing white lead and sulphate of lead, and these regulations were directed towards:—

(1) The prevention of the dangers arising from dust caused by (*a*) the dry rubbing down of lead paint, (*b*) the spraying of lead paint, (*c*) the use of white lead and sulphate of lead in dry or powder form.

(2) The provision of means for personal cleanliness.

(3) Medical examination of workers and notification of cases of lead poisoning.

In regard to the painting of the inside of buildings, where it was considered to be difficult to make regulations effective, and where the use of lead paints was considered less imperative, the Convention purposed to prohibit the use of lead paint after November, 1927, except in cases such as industrial establishments, railway stations, and other places where the use of lead paint was considered necessary.

Under the Convention, the regulations should come into effect on January 1, 1924. The British Government, it was understood, was anxious to introduce regulations as soon as possible, and at a series of conferences recently held between representatives of the Home Office and the Painters' and Decorators' Industrial Joint Council of Great Britain; Draft Regulations were prepared with that end in view.

Of these regulations the most important was probably III, which prohibited dry rubbing down or scraping of surfaces painted with lead paint and aimed at preventing cases of lead poisoning due to the inhalation of dust. It has recently been shown that it was unnecessary to rub down by the dry process, because the work could be done as effectively by the use of pumice stone after moistening the surface with water. That was applicable, not only in the case of oil paint, but with intermediate coats, even within a few hours of the application of the paint. Certain cases, such as the intricacies of door mouldings, presented difficulties in the use of pumice stone, but that could be overcome by the use of waterproof sandpaper, of which several varieties, all suitable and satisfactory, were now obtainable.

Amongst other important regulations were those dealing with cleanliness; there could be no doubt that if persons using lead-containing materials would wash their hands before handling food and attend to the cleanliness of the mouth, the risk of poisoning could be greatly reduced.

Discussion.

In opening the discussion on this paper and Mr. Palethorpe's paper on "Concrete in Municipal Work" (given in our last issue) Professor E. R. Mathews, M.Inst.C.E., s

that concrete linings for pipes formed a splendid preservative; it did not add to the cost, and was to be recommended.

Mr. Shenton expressed the opinion that engineers did not take sufficiently into account the crushing tendency of the weight above underground pipes.

Mr. Whittaker (Croydon) explained that suitable sand for making sand-lime bricks was only known to exist in Kent and Surrey and parts of Suffolk; so far as he knew it was not to be found north of those districts. He urged engineers to experiment with other sands in order to adapt them for the purpose of manufacturing sand-lime bricks; he thought any sand which made a good foundry sand would be suitable.

Mr. Campbell (Edinburgh) said that the difficulty of obtaining ordinary bricks would probably be solved if the sand-lime brick were developed. He also referred to the utilisation of oil shale for making bricks in West Lothian.

Another speaker said it was difficult to get a builder to use a brick which had not been burnt. In Surrey there seemed to be a tendency to use sand-lime bricks for internal walls only, and he would like to know how they weathered.

Professor E. R. Mathews urged engineers not to use concrete tubes unless they were reinforced and unless they had been cured for at least six months.

Another speaker urged that, on account of its cheapness and adaptability, concrete and reinforced concrete should be used in municipal work wherever possible. The cost of shuttering could be much reduced if it were used several times. A great economy was obtained by the use of concrete fence posts, telegraph posts, and gullies.

Mr. Frank (Plymouth) said it was of paramount importance to use the correct amount of water in manufacturing concrete, as an excess of 10 per cent. of water would weaken the concrete by as much as 50 per cent. He strongly advocated the use of the slump test for determining the consistency of concrete.

Mr. W. C. Fenton, F.R.I.B.A., said he had had a remarkable instance of the strength of reinforced concrete in a warehouse he had built. For that building the floors had been designed to carry a load of 3 cwt. per ft. super., and on visiting the building he found one of the floors carrying 10 cwt. per ft. super. There was, however, no trace whatever of any cracks, although it was only six months after the building was erected. He had worked on a factor of safety of 4, and the fact that the floor had successfully withstood a load 150 per cent. in excess of that showed, he thought, that the factor of safety of 4 which was theoretically necessary was in excess of what was practically required. He had recently built a block of offices in Sheffield of monolithic concrete with a thin veneer of granite on the face of the walls; by that method of construction a saving of 25 per cent. was made on the cost of the shell, and in addition the building was more efficient than if it had been built of stone. He also referred to a church at Goldthorpe which had been carried out, together with the vicarage, entirely in reinforced concrete. The building had a most effective appearance, and no material could have been more suitable for the purpose as the ground in the neighbourhood was liable to subsidence.

HOT-WATER SUPPLY AND SLUDGE DISPOSAL.

In a paper with the above title (which was taken as read), Mr. A. J. Martin, M.Inst.C.E., explained that sludge disposal and hot-water supply, although apparently unconnected at first sight, had an important bearing on each other.

The paper stated that sludge contained a respectable amount of combustible matter. Samples of Birmingham sludge dried at 212° F. gave calorific values of 4,120 and 4,893 B.T.U. respectively, or one-third of that of coal. Herr Elsner, in "Treatment and Utilisation of Sludge," stated that briquettes made from dewatered Frankfort sludge, air-dried to 10 per cent. of moisture, gave an effective calorific value of 4,500 B.T.U. per lb. Sludge as it left the tanks contained always a very large proportion of water, often 90 per cent. or more. In that state it would not burn; but it would do so readily if its water-content were reduced by air-drying. During the coal strike of 1912, and again in 1920, a large quantity of air-dried sludge was used to supplement the coal burnt in Lancashire boilers at Birmingham. It was found that, generally speaking, 1 lb. of sludge would raise at least 1 lb. of steam.

Another way of utilising the combustible matter in sludge was to convert it into gas. The sludge might be carbonised in retorts, as was done with coal. The sewage works at Chorley were lighted for some time with gas produced in that way from the pressed sludge, the average yield being 7,000 cu. ft. of 20 candle-power gas per ton.

Gas was also produced by the spontaneous decomposition of the sludge. The sewarge works at Exeter were lighted for many years with the gas from the septic tank; the Leper Hospital at Matunga (near Bombay) pumped its sewage, lighted its buildings and compound, and cooked the patients' food by the same means. Parramatta had for some years pumped the whole of its sewage with the gas from its septic tanks.

The main source of that gas was the cellulose, in the form of paper and vegetable fibre, which constituted a large proportion of the organic matter in sludge. The gas was produced by the decomposition of cellulose by anaerobic bacteria. Omelianski had succeeded in isolating two organisms which had the power to decompose cellulose, the one producing hydrogen and the other methane or marsh gas.

Records of the yield of gas from septic tanks were somewhat scanty; and many of the figures given were unreliable through the absence of proper facilities for collecting and measuring the gas. Observations of the yield over short periods would generally be misleading, for the gas was not liberated continuously, but accumulated in the sludge, from which it broke away at intervals, more particularly when the relief of pressure due to a fall in the barometer caused the imprisoned bubbles to expand. The temperature of the sewage also had an important bearing on the amount of gas produced. At Manchester in 1901 Professor Fowler obtained 1 cu. ft. of gas per 100 gallons of sewage, or 0.61 cu. ft. per head per day. The yield at Exeter was roughly estimated at 1 cu. ft. per head per day. In Mr. James' opinion it would be safe at Matunga to count on an average volume of from 3 to 4 cu. ft. per head per day. Three cu. ft. per head was reported from Parramatta.

It was not necessary to generate the gas in the septic tank itself. The retention in such a tank of large quantities of sludge which was periodically thrown up into the sewage by the evolution of gas was not conducive to the clearness of the effluent. A better plan was to remove the sludge from the tank at short intervals and to digest it in a separate chamber. The digestion of sludge in an independent tank had been carried on in many places for some years, not with a view to the production of gas, but for the purpose of reducing the volume of the sludge and rendering it inoffensive and non-putrescent. That is done on a large scale at Birmingham; and in that case the question of gas production had been lost sight of.

Birmingham produced every year not less than 400,000 tons of sludge, containing over 27,000 tons of dry solid matter, of which 9,000 tons were gasified during digestion, yielding 320,000,000 cu. ft. of gas. That was within a small fraction of 1 cu. ft. per head per day for the whole population of the sewerage district. There was every reason to expect the calorific value of the gas to be from 650 to 700 B.T.U. per cu. ft. The money value of such gas was very considerable. The Gas Light and Coke Co. was selling gas of 500 B.T.U. at 9.2d. per therm, or 3s. 10d. per 1,000 cu. ft. At the same price per therm, the 365 cubic feet produced in one year per head of population would be worth 1s. 9.8d.; or at 3s. 10d. per 1,000 cu. ft., 1s. 4.8d. The corresponding figures for a town of 50,000 people would be £4,500 and £3,500; for Birmingham, with its population of 948,000, £86,000 and £66,000; and for London, with 5,342,000 people, £485,000 and £374,000 respectively.

The yield of gas might be increased in case of need by the addition of waste paper, &c., to the sludge; and there was always the alternative of generating the gas by distilling the sludge in retorts.

Discussion.

Mr. Watson (Birmingham) said the process of turning the gases from sludge into heat was quite practicable, but careful attention should be given to all the conditions before money was invested in such work. Such gas was valuable for the production of power, and he had gone so far as to install a gas engine of 25–30 h.p. which worked on such gas for two or three hours per day. He was not quite satisfied that the process was an economical proposition, otherwise he would have installed a gas holder to impound the gas which was allowed to escape into the air.

Mr. Edward Willis (Chiswick) said he had used sludge in road construction in a low-lying district. The sludge was carefully placed in layers in conjunction with destructor clinker, and when it was opened up again some years later it was found that wedges had to be used to break it; it had become a very hard concrete. He was not quite sure that the utilisation of the gas from sludge was an economical proposition.

NEW METHOD OF LAYING DUST.

A paper, on "Dust Laying by an Emulsion of Oil and Bitumen," was read by Major-General Sir George K. Scott-Moncrieff, K.C.B. He said dust, usually created by some of the processes of civilised life, was characterised by want of cohesion between the particles and increased area of surface tension. It was in some cases of a combustible character and a fruitful cause of explosion in mines, &c., also a danger to health.

The remedy usually adopted of treating the dust with water was unsatisfactory, because of rapid evaporation, and in mines that remedy was not always permissible because of the condition of the natural strata. Water was an inefficient means of treating dust. The ideal liquid in mines was one which contained a small quantity of solvent and had a low-surface tension.

For work on roads a binding element was necessary to provide cohesion in the dust, and that binding element was found in bitumen, which was capable of being melted into a liquid form, and under certain mechanical treatment could combine with oil to form an emulsion.

Thus, there were three elements involved in the emulsion, *i.e.*, water to act as a conveyor, oil to act as a lubricator and transmitter of interfacial energy, and bitumen as a binding element. An emulsion sufficiently stable to be transmitted from the place of manufacture to the place of application, and then locally diluted with water, had been found effective.

The experimental use of that emulsion in mines was still under investigation, but so far it had been found satisfactory in many particulars, and further experiments as to its prevention and the transmission of explosions were now under preparation.

In municipalities the use of the emulsion had been found to result in great saving of water for keeping down dust in streets, and on country roads the emulsion, mixed with nine or ten times its volume of water, and sprinkled by a water-cart in the ordinary way, had been found remarkably effective. The further application of the principle to factories, shops, refuse heaps and so on, had not yet been extensively tried, but there was little doubt that it would be found to be as efficacious as in the case of roads and mines.

Presentation.

Major Lionel D. Lewis, who lately resigned the position of Surveyor to the Abertillery U.D.C., upon appointment under Ministry of Transport, was, with Mrs. Lewis, the recipient of a presentation at a meeting recently at Abertillery.

REINFORCED CONCRETE GRAND STAND AT BLACKHEATH.

The Blackheath Football, Cricket and Lawn Tennis Co., Ltd., are to be congratulated on obtaining such an excellent structure in the new reinforced concrete grand stand which has just been completed to accommodate spectators at their ground at Rectory Fields, Blackheath, S.E., which we illustrate in this issue. The stand was designed by Messrs. Walter Bridges & Co., consulting engineers and architects, of Parliament-street, S.W.1, and constructed under their supervision by Messrs. A. Roberts & Co., Ltd., builders and contractors, of 74, Earl's Court-road, W.

The stand is 300 ft. long and 30 ft. wide, while the terraces in front, which extend along the whole of the length, form an additional forward extension of 25 ft. A roadway at the rear, 20 ft. in width, gives access to the stand, lavatories, offices, &c., underneath the stand, and also provides a parking space for cars.

The structure will accommodate 1,800 spectators seated in the stand and about 3,500 on the terraces in front. There are commodious and well-lighted offices and lavatories underneath the stand, and drainage has been laid for additional dressing-rooms, baths, &c., which it is proposed to erect at a future date.

The original stand, a timber structure of about half the size of the present building, was practically demolished by fire last summer, and the owners have now replaced it with a permanent structure in reinforced concrete, which has a minimum of fire risk and requires the least possible maintenance.

The illustrations show the substantial proportions of the structure, the rigidity of the construction, and the treatment of the exterior. The effect of the completed structure is happily not spoilt by an array of advertisements which it is customary to plaster over football stands nowadays.

The columns are of various sections, from 10 in. by 10 in. to 14 in. by 14 in., dependent upon the unbraced length, the degree of fixity at the footings, and the load to be carried; they are arranged in three rows, approximately 15 ft. apart, with 10 ft. centre to centre between columns in each row.

The treads of the steppings of the stand were made in 3 in. pre-cast reinforced concrete slabs, which were erected on to ledges formed in the pre-cast riser beams and provided with rebates 6 in. by $\frac{3}{4}$ in. at back and front, in which projecting expanded metal reinforcement from the risers was laid and afterwards grouted in. In this manner the advantages resulting from the use of pre-cast members were obtained without sacrificing to any great extent the continuity of monolithic construction.

The steelwork of the superstructure was manufactured and erected by Messrs. James Allan, Senr., & Sons, of Glasgow. Trusses are spaced 10 ft. centres, and each is supported at the back of the stand on short steel stanchions of 12 in. by 5 in. British Standard section well anchored, so as to resist the whole of the horizontal wind stresses.

The trusses at the front are supported on light lattice girders of 30 ft. span, which are bolted to stanchions arranged so that the rectangular down pipes fit into the bosom of the joists.

The risers of the reinforced concrete steppings to the stand are 1 ft. 3 in., and the width of tread 2 ft. 9 in., this latter being somewhat unusually large, but providing much greater comfort for the spectators. The actual proportion of tread to riser was ascertained after a careful study of the levels of the field of play, and the slope calculated so that all spectators have an uninterrupted view of the near touchline.

The front valance boarding was kept sufficiently high to enable the back row of spectators to see the ball throughout its trajectory when punted near the stand.

The terraces in front of the stand are constructed of steps 6 in. by 15 in., the lower nine being formed by a solid bank riveted with timber and the upper seven steps of reinforced concrete spanning 9 in. brick walls at 10 ft. centres.

An independent test made on specimens of concrete taken from batches mixed for the actual job showed excellent results. Three 6 in. cubes were tested, and gave the following crushing strengths per sq. in. at 29 days: 3,940 lb., 4,020 lb. and 4,010 lb., an average of 3,990 lb. The proportion of the concrete was 1 part Portland cement, 2 parts sand, and 4 parts ballast, graded so that the largest particles passed a $\frac{3}{4}$ in. ring.

ACQUISITION OF BREWERY PROPERTY.

Mr. J. D. Wallis, Official Arbitrator, sitting at Doncaster, heard a claim by John Smith's Tadcaster Brewery Co. against the Borough of Doncaster, concerning the Corporation's acquisition of premises in St. Sepulchre Gate and West Leith Gate.

The Official Arbitrator has awarded that the acquiring authority is to pay the owners the sum of £3,945 as purchase money and compensation, and the fees on the award, and £60 towards the costs of the owners.

THE BUILDING TRADE.

SPECIFIC PERFORMANCE: RECTIFICATION OF MISTAKE.

We may draw attention to two important decisions in connection with specific performance of contracts. In Craddock *v.* Hunt (*Weekly Notes*, April 14, 1923) the Court of Appeal held (Lord Justice Younger dissenting) that, where owing to a mutual mistake in reducing a verbal agreement for the sale of land into writing, the written agreement failed to express the actual bargain between the parties, with the result that a piece of land which had been in fact bought and paid for by the plaintiffs was wrongly conveyed to the defendant, who had notice of the plaintiff's title, the Court since the Judicature Act, 1873, had jurisdiction to rectify the mistake in the conveyance, notwithstanding that the deed conformed strictly with the written agreement, and although the effect of ordering rectification was to grant specific performance of a written agreement with a parol variation.

We take the above statement from the headnote of that case in the *Weekly Notes*, and the case has now been followed by the Privy Council in the case, The United States of America and Another *v.* Motor Trucks, Ltd. (*Weekly Notes*, August 11). The respondent company, in 1918, had contracted to machine high explosive shells for the appellant Government, and the contract contained provision for the contract being cancelled when the war terminated, and for certain payments to be made to the company, which were to include reimbursement for the cost of buildings and plant which the company had to provide to carry out their contract. Notice to terminate the contract having been given in November, 1918, at the termination of the war, certain sums were agreed, which included 376,496 dollars in respect of land and buildings. This agreement was subsequently incorporated in a formal document, the material portion of which was "Title to all property specified in Schedule A hereto annexed shall vest in the United States immediately upon execution of this agreement."

The land and buildings, however, were not mentioned in the schedule. The sum agreed having been paid, the Government claimed the land and buildings, but the company denied the right to possession. The American Government then brought this action, claiming rectification of the schedule by the inclusion of the land and buildings and specific performance so rectified of the contract. The case was tried in the Courts in Canada, and the judge had found that the intention of the parties was that the land and buildings should become the property of the American Government, and made an order for performance of the contract. The Appellate Division had reversed this judgment, but the Privy Council have restored it. It was held that the omission to include the land and buildings in the schedule to the agreement was the result of mutual error; but, there being an actually concluded agreement, it could be enforced after rectification consistently with the Statute of Frauds, and the case of Craddock *v.* Hunt was approved. In Canada there is a statute similar in terms to the Judicature Act on this point.

It will be observed that in both these cases there was a definitely concluded verbal agreement, which represented the true intention of the parties, but which through a mutual error had not been incorporated correctly in the formal contract, but the principle would not be extended, we imagine, where there was any dispute as to the terms of the original agreement. In our Legal Section, June 29, we gave an instance of another kind of mistake in a note on Horner *v.* Walker. In that case the formal document had not been signed owing to a wrong part having been sent to the purchaser.

THE LATE SIR HENRY HOLLOWAY.

In our last issue we briefly reported the death of Sir Henry Holloway, J.P., and give herewith an account of his career. The late Sir Henry Holloway founded in 1882 at Battersea, with his brother, the late H. Thomas Holloway, the business of Holloway Brothers, builders and contractors. After a few years hard work the business developed rapidly, and in 1900 more important works premises were acquired on the riverside in Belvedere-road. In 1897 the firm obtained their first really important contract, viz., the building of the new Naval Barracks at Chatham for the Admiralty, at a cost of nearly half-a-million. This contract was carried out to the entire satisfaction of the authorities, and was the forerunner of many large and important contracts, including the London Wall Building Estate (a large block of offices in Finsbury-circus) the amount of the contract being about £400,000; the Central Criminal Court, Old Bailey, on the site of the old Newgate Prison; the New General Post Office and Sorting Office; Messrs. William Whiteley's new stores in Queen's-road, Bayswater; the Admiralty Offices and the large block of Government Offices adjoining St. James's Park. In addition to the large public buildings enumerated above, the firm has also carried out several important housing contracts, viz., the garden city at Rosyth for the Admiralty, a contract of £650,000; the housing scheme for the city of Winchester, a contract of about half-a-million; and a scheme for the Wandsworth Borough Council at Earlsfield.

During recent years the firm has also developed a civil engineering contractors' business, and many important works such as docks, shipyards and bridges have been undertaken successfully. In 1915 the firm again had to move their premises from Belvedere-road to their present site at the corner of Vauxhall Bridge and Grosvenor-road, owing to the acquisition of the former site by the London County Council.

The late Sir Henry Holloway was a past-President of the London Master Builders' Association and also of the Institute of Builders, and J.P. for the County of London. During the war Sir Henry was called upon by the Government to take control of the Department set up for providing temporary housing for munition workers. For about 1½ years he gave himself unsparingly to this important work and carried through what was recognised by many people as one of the best pieces of administrative work done during these critical times. For these services he was honoured with a knighthood and few could have better deserved the honour. In addition to his activities in connection with the firm of Holloway Brothers, he was chairman of the Limmer & Trinidad Lake Asphalt Co., Ltd. He was, a fervent adherent of the Wesleyan Church, of which his father before him had been a local preacher and class leader. He was also a strong temperance advocate. He was in politics a Liberal, and in his younger days was an ardent worker in the cause. He was one of the late Lord Moulton's keenest workers when he won the Clapham Division. He afterwards fought hard for Mr. Reginald McKenna, when that gentleman unsuccessfully contested the same constituency. Sir Henry Holloway was a Freemason and a Past-Master of the Streatham Lodge.

The following were amongst Sir Henry Holloway's many activities:—Governing Director of Holloway Brothers (London), Ltd., chairman of the Limmer & Trinidad Lake Asphalt Co., Ltd., director of Messrs. Chubb's Lock & Safe Co., Ltd., director of the United Kingdom Provident Institution, Director of Temporary Housing under the Ministry of Munitions for about twelve months in 1916-1917; received knighthood in 1917 as recognition of his services to country. On several occasions he was consulted by the late Ministry of Health on the housing question, and, with others, made recommendations which resulted in the subsidy being granted to house builders; was a member of the Government Trade Dispute Disqualification Committee appointed to deal with cases arising out of trade disputes affecting the Unemployment and Health Insurance Acts; member of the Panel appointed by the Government for finding employment for ex-officers; Past-President of the Institute of Builders and London Master Builders' Association; chairman of the Joint Committee of the Federation of Civil Engineering Contractors and Public Works Contractors; founded a scholarship for students of the Architectural Association; governor of Leys School, Cambridge; J.P. for the County of London.

THE INSTITUTE OF BUILDERS.

Mr. F. J. Gayer writes:—

Sir,—The criticism of Mr. Stone on the Institute of Builders' examinations appears to fall into the usual error of being destructive rather than of being constructive, and the criticism in general would appear to be founded upon an "immature consideration" of the real facts. Mr. Stone suggests that the syllabus was promulgated without reference to the many building institutions and educational bodies, whose suggestions might have been of great value. The Institute did, in point of fact, collaborate with several of the best authorities on technical building education, and are indebted to them for their valuable assistance.

Mr. Stone's remarks might be considered very much more appropriate if the syllabus now launched by the Institute was intended to replace all and every scheme of technical education for all and sundry; whereas the Institute, catering for the prospective master builder, very rightly decided that admission to its ranks after this year can only be by examination. Hence they, like any other Institute, have a perfect right to lay down the qualifications by which entry can be made to the Institute. It is common knowledge that there are in the country about 14,000 federated employers in the building industry, and it is the intention of the Institute to secure their recruits from the ranks of the above, and not at this stage to enlarge the scope to include every one connected with the many branches of the Institute.

There is nothing new in an institute defining the conditions under which its members are created; in fact this had ruled since 1834, and the only variation now sought to be established is that entry shall be by examination only. It is possible, even probable, that in the light of experience certain modifications may be necessary in the Institute syllabus, but if it is borne in mind that the Institute is not seeking to revolutionise all courses of building study, but rather to define those subjects that experience has taught to be essential to the master builder, then much of the adverse criticism falls to the ground.

Mr. Stone criticises the judgment of the Institute in attaching some importance to bookkeeping and accountancy costing, &c. Had Mr. Stone's walk in life placed him in the position of a builder, he would long since have recognised that the amount of ignorance in this direction has had a most disastrous influence on the trade, and surely it is one of the fundamental duties of the Institute to foster and develop proper training with a view to uplifting the industry to the high level to which it rightly belongs.

NATIONAL FEDERATION OF BUILDING TRADES' OPERATIVES.

PRESIDENT'S ADDRESS AT THE ANNUAL CONFERENCE.

In his address at the annual conference of the National Federation of Building Trades' Operatives, held at Ilfracombe on Wednesday, Mr. George Hicks, the President, said :—

The present, said a thinker, was the knife-edge of the past cutting into the future, and that was a thought which he might use to convey the further idea that the great value of a conference such as that was the opportunity given by it to consider the events of the past year as a guide to future actions. The National Federation of Building Trades' Operatives, with every constituent body, had passed through a year of no little anxiety. The middle of April this year marked, as they knew, the highest point of crisis in the building industry, when a stage of negotiations had been reached that seemed to make hostilities inevitable. Those threatened hostilities were averted at the last moment, and an agreement arrived at which, so far as the wages question was concerned, had fructified in the arbitrament now in operation. Obviously a compromise, the settlement so far fell short of what their members would have wished to prevail, and in many quarters dissatisfaction was frankly expressed. It was to be understood, but it touched a question of fundamental importance—one that had been raised in other industries as well as theirs—that was to say, the entire position of negotiations as a principle. He took the opportunity of that opening address to examine the matter in the light of what was practical truth, pleasant or unpleasant. In the first place, negotiation with employers was not a cheap and easy method of getting their own way. If they were strong enough they could get their own way by fighting for it at the price of a fight. Employers who met them in conference brought no gifts. It was pull-devil pull-baker, or more appropriately, building worker, with the result invariably (on large issues) of compromise. The word sounded unpalatable, but it was no use for any of them to imagine that wages and conditions negotiation would exist at all if the facts were otherwise. The employers would be fools to come in, and so should they be, merely to argue about what was inevitable by sheer strength of organisation.

What, then, was the worth of negotiation? He left them to judge, but he asked them to judge on business lines. If every strike were successful, if no direct action ever ended in compromise, there would be no argument. But was it so? What they had to form their judgment about was this: taking success and failure together, and the varying measures of both, in past conflicts throughout industry; taking also their own resources and prospects, were they in the long run likely to get more by one form of compromise, negotiation, than by what must be (unless they could be invincible) another form of compromise, *i.e.*, the aggregate outcome of strikes? They must do one thing or another. It was not possible to pick and choose or to say "We can win this issue or that by a fight." There must be common purpose and loyalty, or the cause of the industry as a whole was bound to suffer. They, whose duty it was to carry on pourparlers and to exhaust the possibilities of arrangement, felt as keenly as any of the rank and file the injustice of being forced to accept reductions below the sliding scale adopted in 1921. That was the crux of the matter and a source of legitimate grievance. The earlier variation, they would remember, was agreed to in consideration of a period of stabilisation of wages during which there was every possibility of the cost of living figures dropping substantially below the rate thus stabilised. But it was not just a gamble entered into in any spirit of challenging fortune. It was the issue of a struggle, but the best they could achieve in the circumstances, and one in which Clause 14 C of the document figured to their disadvantage. The recent award of the Arbitrator served to emphasize the same fact. As an award crowning the general negotiations it was favourable to them, since it whittled the employers' demand down by about 75 per cent. He was not more satisfied than them to see the conditions of their industry depreciated. Nevertheless, there was a lesson that labour throughout the country was beginning to learn, that of unity against sectionalism. It was not the weakness of officials, but unpreparedness, backwardness of organisation, lack of common purpose.

On the general question of building trade standards there was one question he wished to refer to which affected the whole country, and the government of the country, as seriously as it affected the building industry. Few people realised how serious the reduction was in regard to the attractiveness of the industry when they faced the fact that population was racing houses and gaining rapidly. If all the available labour was put on to building houses at once it would take a score of years to catch up in that race, according to any tolerable measure of housing accommodation. That was the position as things stood. But a fact of greater gravity remained. It was common knowledge to them that building was not to-day attracting new blood sufficient to compensate for the natural loss of man-power due to the passage of time. What that meant to the nation ought to be plain to the minds of those who had the nation's affairs and destinies in charge, except that foresight seemed no more to be a quality of statesmanship than public interest a concern of capitalism. It was at such a time that the attempt was made to filch from the building operative the small advantage gained as a result of improved organisation over the conditions that prevailed in 1913. The best authorities on housing outside the building industry were agreed that good conditions must be established if the present numerical strength was to be kept up, let alone increased, and the point of view was laid down explicitly at the last conference in London of municipal representatives convened by the National Housing and Town Planning Council. He warned those who had any shred of responsibility in that matter that they were drifting to a condition where the limit of possible overcrowding would be reached, and this country would have not only an unemployed margin but literally a houseless margin, which would mean desperation and potential barbarism. The fact that fathers were ceasing to apprentice their boys to their trade in anything like the number of former times, and that apprenticeship wages were ridiculously low was a striking commentary on the supposition of relative prosperity in the building industry.

It was to be recorded with considerable satisfaction that officials of the National Federation were invited to sit upon the Special Committee on Building Materials' Prices which was appointed by the Government to watch the building rings, with particular regard to the State subsidy. That the proposal to spend public money to encourage house building would lead to inflated prices, which, if not checked, would absorb the whole of the subsidy, was taken for granted by every responsible person and apparently by the Government. But merely to hold a watching brief under the present terms of reference was not even a case of locking the stable door after the steed had been stolen. It was asking the thief to purloin the harness as well. The terms of reference must be enlarged to the extent of enabling the Committee not only to demand the production of business ledgers and accounts wherever required, but also to make definite proposals for legislation according to what was necessary for effective control. It was amazing that, with a problem so vital to the industrial efficiency, general health, and social morality of the nation confronting the executive to-day, a handful of grasping profitmongers should be allowed to stop progress in the name of private enterprise. That was what it meant. What municipality—or, for the matter of that, what ordinary builder—was going to plan house erection or town development at a loss to fill the pockets of the trusts? The race might be poisoned in filthy slums, just as it might be battered and even annihilated in future wars, so long as "business is business" to-day no matter what the consequences to-morrow. Their demand was for nothing more ambitious than moderately decent living conditions, and without those it was shown the industry could not live. If they were to be denied upon the ground that it did not pay to feed and clothe them properly, what was to be done to the commercial vampires who drained even the life-blood infused into the industry's veins by State surgeons?

Turning to their domestic affairs once again, he thought they would agree that prospects of closer unity were growing rapidly. The discussions that had taken place between the Amalgamated Society of Woodworkers and the Amalgamated Union of Building Trade Workers were an indication of the progressive tendencies in existence and the present position of those negotiations was a matter upon which congratulations were due. Industrial unionism meant one union for one industry and was an alternative to craft unionism, which meant one union or more for each separate trade. Ever since the miners (together with their dispute) were "settled" in the Spring of 1921, the movement in support of industrial unionism had grown rapidly, and the work of the General Council recently in bringing unions of associated interests together in conference promised far-reaching results. Some of the difficulties to be overcome were technical; others depended for solution upon education and sufficient of the industrialist spirit in the unions. The case for industrial unionism rested upon facts of capitalist organisation, which were plain to everyone. In the business world enterprise was not in the main split into crafts. Even where specialist distinctions existed the tendency to amalgamation of interests, or at least very close federation, was prominent. Sectional jealousies and even serious competition were beginning to be eliminated for the sake of common advantage. Between employers there was a stronger sense of affinity than ever. Trusts, rings, joint directorships and joint stock helped to complete the process of breaking down the old solid exclusiveness of the individual master. Workers of all crafts within one industry or more were brought together on the job, under the same control, exposed to the same conditions, good or bad, and working to the same end.

Industrial unionism was the inevitable answer of organised labour to modern developments of capitalist industry and finance with their political connections. The task before them was to find within each body of organisations an administrative scheme that, granting the desire for amalgamation, would be acceptable to the separate units, and that meant taking account of and dealing with the peculiar difficulties that in the past had influenced opinion adversely and given arguments for the propaganda of those whose interests lay in preventing union. That large amalgamations had taken place where, prior to the event, societies were diverse in machinery, funds, craft interests and schedules of benefit, proved that, if the will existed, the way was to be discovered. Probably the most important of the difficulties to be dealt with was of the craft. Craft was, like nationality, a matter of temperament, tradition and pride. But if all those were submerged in a wider outlook, or at least adapted to fraternal necessities, there still remained the practical workaday interests of the craft that men in the trade considered themselves best fitted to decide upon. A great deal of the opposition to amalgamation that was met with arose from fear, especially in the case of specialised crafts, that such interests might be overlooked or deliberately neglected. Beyond that were questions of workshop

management, for instance, more important to the craft itself than might be the case to the industry at large. Those matters were familiar enough to everyone who had been engaged in conference or negotiation with a view to amalgamation, and in some cases where union had been accomplished they remain sources of undesirable friction.

Closer unity, however, need not spell the submerging of legitimate craft interests, and he was convinced that it was within the practical wit of trade unionists to find ways of guaranteeing reasonable independence and even a considerable measure of trade autonomy whilst securing that common organisation and movement which events proved more and more every day to be necessary in the larger issues. The future was with those who would sink what was petty and rise to the higher call of human fraternity and industrial freedom. The National Federation of Building Trades Operatives had done and was doing fine pioneer work for closer unity, patiently serving the interests, separate and communal, of all trades concerned. That experience and lesson would bear rich fruit as time went on in proving that they could work together as comrades for great and enduring ends. With their industrial effort and all the promise it afforded there was disappointment in store for those who believed that trade unionism could be separated from political matters with advantage or without injury. The history of the past century showed that conditions affecting labour could be vitally improved by labour legislation and injured by legislative neglect; the facts of the immediate present were eloquent of what might be achieved by wise co-operation of industrial and political power. Labour was ready to mount the saddle—the race was for economic freedom. That end was not industrial only, nor political only; it was both, transformed into the people's co-operative State.

THE SMALL DWELLINGS ACQUISITION SCHEME.

At a meeting of the Maldens and Coombe Urban District Council, held on August 9, Councillor Kirk (Deputy Chairman of the Small Dwellings Acquisition Committee) reported on action arising out of applications made by local builders and contractors for the recommendation of the local authority to the Minister for the benefit of grants by way of lump-sum payments as set forth in the Housing Act and Circular 388.

The Ministry of Health had replied that the Minister was not satisfied on the information before him that the need for houses proposed could not be met without assistance.

The effect of the decision (said Councillor Kirk) was to stifle building operations and end all confidence with the Government department and, moreover, place the county and even the country in a grave competitive position. In short, the promise of a subsidy was an essential factor to encourage, secure, and complete the house ownership difficulty, and had already had marvellous self-help quickening power.

The Council passed a resolution expressing its surprise and disappointment at the Ministry's decision, and pledged itself immediately to approach all local authorities within the county with a view to entering a county protest against the restricted and prejudicial action of the Minister and his advisers in excluding houses of a type and size specified in Section 1 of the Housing, &c., Act, 1923, and which in the opinion of the local authority is suitable to the needs of the area.

The Council urged that a Conference of local authorities and interested bodies be convened by the Thames Valley Councils' Association to determine county action immediately replies are forthcoming.

RATES OF WAGES IN THE BUILDING TRADE.

The following are the rates of wages in the building trade in England and Wales. Every endeavour is made to ensure accuracy, but we cannot be responsible for errors that may occur:—

	Masons.	Bricklayers.	Carpenters, Joiners.	Plasterers.	Slaters.	Plumbers.	Painters.	Brick-layers' Labourers.	Masons' Plasterers
Aberdare	1/7	1/7	1/7	1/7	1/7	1/7	1/7		1/2½
Accrington	1/7	1/7	1/7	1/7	1/7	1/7	1/7		1/2½
Altrincham	1/7	1/7	1/7	1/7	1/7	1/7	1/7		1/2½
Ashton-under-Lyne	1/7	1/7	1/7	1/7	1/7	1/7	1/7		1/2½
Barnsley	1/7	1/7	1/7	1/7	1/7	1/7	1/7		1/2½
Barrow-in-Furness	1/7	1/7	1/7	1/7	1/7	1/7	1/7		1/2½
Barry	1/7	1/7	1/7	1/7	1/7	1/7	1/7		1/2½
Bath	1/4	1/4	1/4	1/4	1/4	1/4	1/4		1/0
Bedford	1/3½	1/3½	1/3½	1/3½	1/3½	1/3½	1/3½		0/11½
Birkenhead	1/9	1/9	1/8½	1/9	1/9	1/9	1/8½		1/4
Birmingham	1/7	1/7	1/7	1/7	1/7	1/7	1/7		1/2½
Bishop Auckland	1/7	1/7	1/7	1/7	1/7	1/7	1/7		1/2½

(For rates of wages in the Building Trade in Scotland, see page 265.)

CONTRACTS, COMPETITIONS, &c.

For some contracts still open, but not included in this List, see previous issues. Those with an asterisk are advertised in this number. Certain conditions beyond those given in the following information are imposed in some cases, such as that advertisers do not bind themselves to accept the lowest or any tender; that a fair wages clause shall be observed; that no allowance will be made for tenders; and that deposits are returned on receipt of a bona-fide tender unless stated to the contrary.

The date given at the commencement of each paragraph is the latest date when the tender, or the names of those willing to submit tenders, may be sent in; the name and address at the end is the person from whom or place where quantities, forms of tender, &c., may be obtained.

BUILDING AND PAINTING

HEAVY TRAFFIC AND VIBRATION.

Writing with reference to a paragraph in our issue of July 27, the Thames Paper Co., Ltd., of Purfleet, Essex, state:

"There is constantly accumulating evidence that the ordinary plaster ceiling will not withstand the disintegrating effects of vibration inseparable from the modern conditions. Basing one's assumption on the number of cases of falling ceilings which are reported in the columns of the Press, it seems obvious that the fall of plaster ceilings is a frequent occurrence, and in many cases more or less serious injury results. The trouble is by no means limited to old property, for it seems that a great many of the subsidy houses erected during the last two or three years have defective ceilings. In some cases practically all the houses on an estate are suffering from the defect. It will be said by some, no doubt, that this is the result of hurried workmanship and is not due to the method, and while it might perhaps be admitted that many of these houses were put up under difficulties, at the same time the trouble is so general that it indicates an inherent weakness in plaster ceilings. In any event the shortage of really skilled plasterers is a factor to be reckoned with, whilst the increased amount of vibration to which you allude in your article as a result of the increase in mechanically propelled traffic is something which ought not to be overlooked. All these indications seem to point to the necessity for revising the methods of ceiling construction. By the use of a good wallboard the danger of falling ceilings is entirely obviated. This material is easily and quickly fixed, and with the exercise of ordinary care and attention to the simple precautions that experience has shown to be necessary, satisfactory ceilings, that are, to all intents and purposes, permanent under the most severe conditions of vibration, will be secured."

DONCASTER STREET IMPROVEMENTS.

Mr. J. D. Wallis, Official Arbitrator, at Doncaster, heard the case of the Doncaster Corporation and the Doncaster Co-operative and Industrial Society, Ltd., concerning the Corporation's acquisition for the purpose of street improvements, of land, shop and premises, known as No. 58, St. Sepulchre Gate, Doncaster.

Mr. Jardine, for claimants, handed in the notice to treat and particulars of the claim, dated March 2, 1914, for £4,456. He said this claim was binding upon the claimants, but, as the notice to treat was served nine years ago, the property had an increased value to-day. The Co-operative Society, in consequence of the notice to treat, had bought other and larger premises on April 15, 1914, at the corner of Printing Office-street and St. Sepulchre Gate, for £8,000, and spent £4,224, between 1911 and 1923, on extensions. They continued trading at 58, St. Sepulchre Gate until June, 1914, and between then and September, 1914, the removal took place. For the remainder of 1914 they traded at the new premises and had the old premises on their hands. The Corporation took possession of the old premises on January 1, 1915. They bought the premises, No. 58, St. Sepulchre Gate on June 24, 1911, for £2,900, and they spent £605 on them. Their valuation of the property was now £4,500.

Mr. T. H. Johnson, architect and surveyor, Doncaster, giving evidence for the claimants, said that 58, St. Sepulchre Gate was one of the best business positions in the town. His valuation was £4,532. The rental value before the war was, in his opinion, £250.

In cross-examination by Mr. Schofield (counsel for the Corporation), Mr. Johnson said the new site was a better one. The price paid for that was £24 a yard with costs.

On behalf of the Corporation, Mr. Wm. Dawson, valuer, of Doncaster, submitted a valuation of £3,137 10s. He said he should take the site value of the new premises in 1914 at £20 a yard. The site value of the old premises in 1914 he would put at £15 a yard.

Mr. Sept. Hedley, valuer, of Sunderland, also giving evidence for the Corporation, submitted a valuation of £3,257.

The Official Arbitrator, who reserved his decision, has since awarded that the acquiring authority is to pay the owners the sum of £3,780 as purchase money and compensation, and the fees on the award, and £50 towards the costs of the owners.

NEW BUILDINGS IN SCOTLAND.

Leven.—Houses.—The T.C. is informed that the Board of Health is prepared to advance an annual payment of £432 for the municipal housing scheme, which, it is estimated, will enable the Council to build 60 houses—30 immediately.

Greenock.—Houses.—The Corporation proposes to erect 150 houses along a new street to be formed between Peat-road and Gateside.

Dundee.—Baths.—At a meeting of the T.C. held recently it was reported that the Baths Department required £5,000 for repairing the baths and washhouses.

Cove.—Church Renovations.—Efforts are being made to raise £1,500 for the renovation of the organ, the enlargement of the church hall, and the redecoration of the interior of the Cove and Killcreggan United Free Church.

Dunbar.—Houses.—The T.C. has been notified that estimates for the erection of 12 houses in Belhaven-road, under the Board of Health housing scheme, have been accepted. Under the original scheme the number of houses to be erected was 50.

Prestwick.—Houses.—The Dean of Guild Court has passed the following plans: Twenty-one houses in Mansfield-road, for Mr. D. Alexander; four houses in Bank-street, for Mr. J. McG. Owen, at an estimated cost of £2,600; Mrs. McKie, a house in St. Quivox-road, at an estimated cost of £1,500; Miss M. W. Gardiner, a house in Ayr-road, at a cost of £875; and Mr. T. Howie, a garage at "St. Ninians," at a cost of £145.

Oban.—Hall.—The Dean of Guild Court has passed plans for a hall in connection with the St. Columba Roman Catholic Pro-Cathedral, with seating accommodation for 352 people.

Dennistoun. — Villa. — Mrs. D. Herbert, Whitehill-gardens, Dennistoun, has presented plans for the erection of a two-story villa on the south side of Victoria-road.

Mossvale.—Houses.—The Lower Ward Committee of the County of Lanark has passed plans for two semi-detached houses for Mr. Hugh Cleland, Drumcavil-road, Mossvale, Chryston, near Glasgow.

Bonnyrigg.—Tenement.—The T.C. is erecting a tenement of from 20 to 24 houses, and have appointed Mr. Gray, architect, to carry out the scheme.

* These prices apply to *new buildings only*. They cover superintendence by foreman and carry a profit of 10% on the prime cost without establishment charges. A percentage of 1¼ should be added for Employers' Liability and National Health and Unemployment Acts and from 1s. 6d. per £100 for Fire Insurance. The whole of the information given on this page is copyright.

PROPOSED NEW BUILDINGS & OTHER WORKS.*

In these lists care is taken to ensure the accuracy of the information given, but it may occasionally happen that, owing to building owners taking the responsibility of commencing work before plans are finally approved by the local authorities, "proposed" works at the time of publication have been actually commenced. Abbreviations:—T.C. for Town Council; U.D.C. for Urban District Council; R.D.C for Rural District Council; E.C. for Education Committee; B.G. for Board of Guardians; L.C.C. for London County Council; B.C. for Borough Council; and P.C. for Parish Council.

ABERDEEN.—Plans passed: Dwelling-house and garage on the east side of Royfold-crescent, for the Misses Isabella and Jemima Reid, per Messrs. Brown & Watt, architects; alterations at Gray's School of Art, Schoolhill, for the Governors of Robert Gordon's Technical College, per Mr. R. L. Rollo, architect; garage, 25, Fonthill-terrace, for Dr. Theodore Shennan, per Messrs. D. & J. R. M'Millan, architects; two garages, Hope-street, for Mr. Edward Reid and Mr. Frank J. Whitehead, per Messrs. Sutherland & George, architects; garage and store, 39, Carlton-place, for Mr. Andrew Stott, per Mr. G. Bennett Mitchell, architect; garage, 1, Woodstock-road, for Mr. Robert M. Smith; garage, 46–48, Whitehall-road, for Miss M. Moss; alterations and additions, 34, Queen's-road, for Mr. J. H. Coutts, per Mr. A. H. L. Mackinnon, architect; golf club-house, for the Northern Golf Club, per Mr. William E. Gould, architect.

ABER VALLEY.—A welfare scheme by joint action of colliery companies, colliers and Miners' Welfare Grants Committee, involving an expenditure of £5,000 in constructive and ground lay-out work, has been framed for Aber Valley (Glam.); and Councillor William Morgan, miners' agent, has been elected secretary of committee.

ACCRINGTON.—The Accrington Co-operative Society, Ltd., propose to erect a new store and 11 houses on the Laneside Estate.

ALNWICK.—Plans passed by R.D.C.:—Bungalow, Usher-lane, Alnmouth; garage at Newton-on-the-Moor; house near Shilbottle.

ALSAGER.—Structural alterations are proposed at the "Alsager Arms" Hotel, for Mr. W. Brocksbank.

AMMANFORD.—Grant of £1,994 towards improvement of Wind-street has been received by the U.D.C., and work is to be put in hand.——The U.D.C. has decided to demolish old buildings in Pentwyn-road and improve the corner, and is treating with church authorities and Bethany Chapel trustees for sanction to take back boundary walls for alignment of road.——The miners' lodges are treating for a site to build new public hall and library under Miners' Welfare scheme.

ANDOVER.—The Southampton C.C. proposes providing a new secondary school for girls at an estimated cost of £11,300.

ASHTON-UNDER-LYNE.—The Education Committee have instructed Messrs. John Eaton, Sons, & Cantrill, architects, Stamford-street, to prepare plans for the erection of a two-story school with accommodation for 600 children; also to submit an estimate of cost for a one-story building of a type suggested by the Board of Education. The T.C. has decided to erect 19 shops outside the market in Bow-street and Market-street, and have given permission to the Markets Committee to appoint an architect to prepare plans and estimates.

BACUP.—The T.C. has decided to purchase the Heath Hill estate, Stacksteads, and have given instructions to the builder to proceed with the erection of a further 20 houses of the parlour type.

BASINGSTOKE.—Lord Bolton, of Hackwood Park Basingstoke, has initiated a scheme to relieve the housing difficulty. In order to facilitate the building of houses for the working classes he has allotted plots on four of the main roads leading out of Basingstoke, and convenient of access to the centre of the town. The sites each cover about a quarter of an acre, and are on roads which are already sewered, and have water, gas, and electricity services. These sites will be allotted to working men in the district desirous of acquiring their own freehold, and payments will be arranged on the deferred system. They are being rapidly acquired, and the scheme is so popular that it is believed the housing difficulty in the district will be fully met by Lord Bolton's liberality and enterprise.

BATLEY.—Plans passed: Handsome new offices at Lakeridge Mills, Blakeridge-lane, for Messrs. J. T. & J. Taylor, Ltd.; house at Norfolk-avenue, Carlton Grange, for Mr. B. H. Childs; two houses at Norfolk-avenue, Carlton Grange, for Messrs. G. & J. Mortimer, Ltd.; house and shop, Mill-lane, Hanging Heaton, for Mrs. Wood; and additions to premises in Town-street, Batley Carr, for Messrs. M. Watssmann & Son, Ltd.

BENTLEY.—Mr. M. G. Weekes, Inspector of the Ministry of Health, has conducted an enquiry into the application by the U.D.C. for permission to borrow £4,350 for the purpose of sewage works extension at Oaksey-lane.

BIRKENSHAW.—Plans passed: Two houses, for Mr. Jackson Foster; two houses for Messrs. Jowitt & Haylshon; and new cowshed at Miazebrook, for Mr. Wigglesworth.

BISHOPS STORTFORD.—Plans passed by U.D.C.:—Extension to maltings, Dane-street, for Messrs. Bennes; house, London-road, for Mr. Stevens.

BLACKBURN.—The Corporation have received sanction to proceed with the completion of the new arterial road from Brown Hill to Whalley Old-road, the work to be carried through by direct labour in relief of unemployment. Sanction has also been received for the erection of 97 dwellings on the Intack Estate, some of which will be flats. It is the intention of the Corporation to invite tenders for the erection of 36 of the houses. The Corporation have applied for sanction to borrow £30,000 for extensions to the five retorts at the Greenbank Gas Works, and the installation of twelve waste heat boilers.

BLACKLEY.—Messrs. W. Johnson & Son, architects, Oldham-road. Miles Platting, are preparing plans for a detached house in Polefield-road, for Mr. G. J. Irving.

BLACKPOOL.—Messrs. Owen & Co., builders, 16, Talbot-street, Moss Side, Manchester, have secured a site in Cavendish-road, Bispham, to erect a detached and semi-detached houses, brick-built, slated or tiled roofs. Rough-cast and half-timbered, containing two reception rooms, kitchen scullery on ground floor, four bedrooms, bath-room, &c., on first floor, coal cellar and larder in basement, with labour-saving fittings. Work is to be commenced immediately.

BOGNOR.—The proposal of the U.D.C. to borrow a further sum of £5,000 for sewerage works, and £1,800 for an improvement of the roadway and promenade, has been before an inspector of the Ministry of Health (Mr. P. M. Croothwaite) at a local inquiry.

BOLTON.—Plans have been approved for structural alterations to the "Sir Sidney Smith," Bridgeman-street, and the "Bee Hive" Inn, Duke-street.

BRADFORD.—The erection of an infirmary at Daisy Hill is being considered. An offer of £100,000 has been made for the present premises for conversion into municipal offices. The B.G. has consented to the provision at the Daisy-hill Institution of a new entrance-lodge and attendant's residence, a stable, and extension of the dining-hall, at a cost not exceeding £2,650, and to the application of a portion of the proceeds of the sale of the Eastby Sanatorium for the purpose of defraying the aforesaid expenditure.

BRADSHAW.—The Parochial Council of Bradshaw propose to erect a memorial to the late Rev. R. J. Judson, M.A., in the form of a reredos carved in wood. It has been designed by Messrs. Bradshaw, Gass, & Hope, architects, 19, Silverwell-street, Bolton. The estimated cost is £200 to £250.

BRAMHALL.—Plans passed by the D.C.: Four houses, Nevill-road, for Messrs. Oakes & Kidd; shop and house, Buxton-road, for Messrs. Bancroft & Pixton; house, Douglas-road, for Mr. J. Moss; house, Carr Wood-road, for Mr. W. G. West; house, Bosden Fold-road, for Mr. J. Smith; 34 houses, North Park-road, and Glyn-road, for Residents, Ltd.; 10 houses, Offerton-lane, for Mr. A. Frost; house, Buxton-road, for L.M.S. Railway; new roads, Midland-road and North Park-road, for Messrs. Venables; and Ladythorn-crescent, for Messrs. Brocklehurst; 6 houses, Grenville-road, for Messrs. Oldham & Hallworth; house, Offerton-lane, for Mr. W. Swann. Mr. W. H. Snow, builder, 119, King-street, Stretford, has secured a site in Moss-lane to erect residences.

BRECONSHIRE.—The County Council is to widen Glais Bridge, Pontsam, and bridge over Dulas River, at estimated costs, respectively, of £500 and £400.——The Builth Wells U.D.C. will shortly invite tenders for foundation work and lay-out in connection with the War Memorial scheme.

BRIDGEND.—The U.D.C. has passed plans for four new houses at Merthyrmawr-road for Messrs. Hitt & Morgan. The Penybont (Bridgend) R.D.C., at instance of Ministry of Health, will erect new maternity centre, estimated to cost £2,000, and has invited Bridgend U.D.C. to share scheme. The Glamorgan C.C. has notified R.D.C. of site selection for new school at Pontrhydycyff and Penybont R.D.C. is selecting site for proposed school at Pyle. Estimates submitted to Penybont Council for building of generating station at Kenfig Hill, distribution of cables, &c., in connection with proposed electricity scheme, amounting to £28,760 initial capital expenditure.

BRIERFIELD.—Plans passed by U.D.C.: For conversion of house, 26, Sackville-street, into house and lock-up shop, for Mrs. M. A. Pickles; for conversion of house, 14, Ann-street, into house and shop, for Mrs. Parker.

BROCKENHURST.—Addition to buildings at the County School are proposed by the Southampton C.C., estimated to cost £3,264.

BURNAGE.—Mr. H. M. Emery, builder, 38, Errwood-road, Levenshulme, proposes to erect shops on a site in Burnage-lane.

BURNLEY.—Plans approved at a meeting of the Improvement Committee: Two houses, Queen's-road, for Messrs. Butson, Clegg & Holdsworth; additions, Victoria Hospital, for the Board of Management; house, Barden-lane, for Mr. G. A. Jobling; alterations, 2, Lowerhouse-lane, for Mr. Herbert Draper; eight houses, Marsden-road, for Mr. W. Taylor; additions to kitchen and pay-box, Savoy Café Cinema, Manchester-road, for Messrs. Savoy (Burnley), Ltd.

BUXTON.—Plans passed by T.C.: House in St. John's-road, for Mrs. H. Wood; lavatory at the King's Head Hotel, for Messrs. Marston, Thompson & Evershed, Ltd.; gravel store in Ashwood Dale, for Mr. Norman Axe.

CAERPHILLY.—Structural alterations to the "Star" Inn, Nantgarw, are to be undertaken by the Rhondda Valleys Brewery Co., Pontypridd.

CARLISLE.—Plans passed by R.D.C.:—Mr. Stead, Dalston Hall, additional farm buildings at Low Cummersdale Farm; by Mr. H. E. Ayris, architect, Lowther-street, on behalf of Mr. F. H. Oldfield, Scotland-road, Stanwix, for a pair of semi-detached houses near Whiteclosegate.

CHARTHAM.—The Kent C.C. has decided to enlarge the asylum at a cost of £60,000 (including equipment).

CHELTENHAM.—Plans passed by T.C.:—H. Webb, alterations, 187, High-street; J. Lethbridge, additions, 27, Grosvenor-street; J. Holman, additions, 13, Great Norwood-street; Mrs. E. Courteen, house, Leckhampton-road; Miss F. Acock, house, Whaddon-lane; A. Edwards, motor house, Old Bath-road; Miss Mortlock, house Whaddon-lane; H. Greaves, motor house, Donnabate, St. George's-road; G. H. Roberts, additions to stables, Alexandra Villas, Hewlett-road; Sharpe & Fisher, Ltd., store building, Swindon-road.

CHESTER-LE-STREET.—The U.D.C. has decided to ask the Ministry of Health to sanction the erection of 250 more houses on the Council's building estate.

CRUMPSALL.—Mr. F. E. L. Harris, architect to the Co-operative Wholesale Society, Ltd., 99, Corporation-street, Manchester, has prepared plans for a detached house to be erected in Park-road, Crumpsall, for Miss E. L. Stephenson.

DARWEN.—The Health Committee recommend the T.C. to spend £2,000 on improving accommodation for nurses at Bull Hill Hospital.

DEAL.—Plans passed by T.C.:—Alterations at 12 and 14, Victoria-road; two houses in Stanhope-road, for Mr. J. Howland; two detached houses in Church-path, by Mr. G. E. Tournay.

DELPH.—It was decided to invite tenders for the erection of Council houses. Tenders had come in, but not being endorsed, they had been opened in mistake. Under the circumstances, it was decided to invite tenders in a new form.

DEWSBURY.—Plans passed by T.C.: George Benson, workshop, Edge Top-road, Thornhill; W. C. Wakefield, two bungalows, Church-lane, Thornhill; H. Burton, shed, off Wakefield-road, Chickenley; J. C. Crawshaw, additions, Holly-bank, Halifax-road; A. Barker, dwelling-house, Thornhill Cross; Warwick & Co., garage, "Waggon and Horses Inn," Chickenley Heath; G. Gallagher, addition to house, Arroyd-street; W. C. Wakefield, two houses, Deadman's-lane, Thornhill; Camroyd Motor Co., service depot, Leeds-road; Yorkshire (W.D.) Electric Tramways, Ltd., extension of motor garage, Tram Depot, Savile Town; H. Mayman, extension to "Mayville," Oxford-road; Mrs. E. A. Simpson and Mrs. B. Sterry, two dwelling-houses, Earlsheaton Common. The Technical School is to be fitted with a mining laboratory at a cost of £426.

DUKINFIELD.—Messrs. W. Kenyon & Sons, Ltd., Chapel Field Ropery, are constructing a new tennis court for the use of their employees.

DUMBARTON.—Another instance of the enterprise of Dumbarton Building Society (Limited), was given in the Dean of Guild Court when plans were presented for the erection of 21 cottages on a site fronting Silverton-avenue in the Newtown district of the burgh. The plans were passed. Each house will consist of a living-room, kitchenette, three bedrooms on upper floor, bath-room, and other conveniences, and will be electrically lit throughout. Six of the houses will be allocated to ex-Service men.

DURHAM.—Plans passed by T.C.:—Dean and Chapter, boarding-house adjoining Langley House; Co-operative Society, lavatories, &c., at Claypath.

EALING.—At its last meeting the T.C. passed plans for the erection of six new shops and nine garages in Uxbridge-road, Ealing Common, 22 lock-up garages in Elers-road, at the rear of Nos. 104–55, Northfield-avenue, 10 lock-up shops in Northfield-avenue, three houses in Carew-road, four in Tring-avenue, one in Raymond-avenue, one in Park-View-road, and one in Castlebar Park (for Sir John Young). Plans were also passed for St. James's new vestry hall, the Ealing Chamber of Commerce £1,000 house in Camborne-avenue, and the extension of Ealing Hospital.

EARSDEN.—Plans for the erection of a branch store at Castle Park, Backworth Village, by the Backworth Co-operative Society have been passed by the U.D.C.

FAILSWORTH.—Manchester Licensing Justices have approved plans for sanitary alterations to the "Bridge" Inn, for Mr. T. Barnes.

FARNHAM.—Application is to be made to the Ministry of Health by the U.D.C. for approval of a scheme for the provision of an additional 30 working-class dwellings, to contain three bedrooms each, 20 of a non-parlour and 10 of the parlour type, and to the building of two pairs of houses upon the remainder of the Weybourne site, and a block of three houses upon a site belonging to the Council fronting Ridgway Hill-road.

FISHGUARD.—A site has been obtained for a new parish hall to be built for St. Mary's Church.

FOLESHILL.—A legacy of £1,000 left by Miss Nicklin to St. Laurence's Parish Church, Foleshill, is to be devoted towards enlarging the fabric.

GLYNCORRWG.—The U.D.C. has obtained sanction to put in hand work of constructing new culvert at Abergwynfi, to cost, estimate, £2,000. The Ministry of Health is considering application of U.D.C. to undertake road and bridge widening work at Abergwynfi.

GORTON.—Messrs. Thorpe & Collin, architects, 66, Deansgate, Manchester, are preparing plans for a garage to Lonsdale House, Hyde-road, and Break Range, Gorton, for Mr. R. Ashworth, and for the conversion of house, Hydc-road and Ashwood-avenue into shop and house, for Mr. R. Dewhurst.

HAILSHAM.—Plans passed by R.D.C.:—Bungalow on Hammonds Farm, Laughton, for Mr. George Ancill; house at Stonehill, Chiddingly, for Mr. E. R. Vincent; house at Upper-street, Ninfield, for Mr. W. H. Burt; bungalow, near Beestons Farm, Warbleton, for Mr. P. G. Barrow.

HALIFAX.—The Borough Surveyor has been instructed to obtain tenders for the erection of new tramways and parcels offices on a site in Powell-street. The Corporation are seeking sanction to borrow £13,000 for the erection, and £1,400 for the land from the Ministry of Health.

HEALD GREEN.—Mr. A. Hollows, builder, 27, Elmsmere-road, Didsbury, is erecting houses on a site in Finney-lane.

HORSFORTH.—The proposed new road and bridges at Calverley have been approved by the West Riding C.C. Work is to be commenced at once; the estimated cost is about £137,000.

HOVE.—A scheme for the erection of a "luxury" pier, at a cost of £180,000, is reported nearing completion at Hove. The principal directors of the company responsible for the scheme are stated to be Sir Charles Ruthven, Sir Cecil Partridge, and Alderman S. Isger, a member of Hove Town Council. The company will be known as the Hove Pier, Theatre, and Kursaal Co.,

and the pier, 1,250 ft. long, and designed by Mr. H. Hoyne Fox, for many years chief architect and engineer to the Government of Burma, will be built of ferro-concrete on a site at the western end of the front. The scheme is to include a theatre seating 1,400 people, a kursaal, and a dance or concert hall accommodating 1,000 people. The principal floor of the kursaal is to be used as a residential club.

KINGSBURY.—The Ministry of Health has intimated to the U.D.C. that it will be prepared to approve a scheme for the erection of 24 houses. The original scheme was for 48 houses.

KNOWLE.—The Solihull magistrates have granted a provisional licence for the erection of a cinema with approximate seating accommodation for 250 persons, to John E. Chamberlain, of Knowle.

LEEDS.—The Finance and Parliamentary Committee is recommending the City Council to purchase the Chapeltown Barracks in the city for £12,000, for the purpose of utilisation under the Blind Persons Act. The buildings and estate, which cover 53,000 square yards, will be turned into hostels and workshops for the blind.——The B.G. propose erecting new offices for Armley and Bramley overseers, at an estimated cost of £2,100.

*(*b*) Blaker Bros. 107 15 1

LEATHERHEAD.—For making up Poplar-road for the U.D.C. :—

*R. & D. Swinford, Woking £936 4 3

LEEDS.—For the erection of a new temperance hall at Rawdon, for the Temperance Council. Messrs. Braithwaite & Jackman, Architects, South Parade, Leeds :—

*L. Harpham, Leeds.

LEEDS.—For the erection of new agricultural departments block at the University of Leeds fronting University-road. Mr. Paul Waterhouse, Architect, London :—

*Armitage & Hodgson, Leeds.

LEEDS.—For the erection of a new telephone exchange at Chapeltown, for the Commissioners of H.M.O.W. :—

*Arthur Mitchell, Ltd., Leeds—*Construction.*
*Tunstalls' Rock Asphalte Co., Leeds—*Asphalter.*

LEEDS AND LIVERPOOL CANAL.—Eleven tenders were submitted for construction of a ferro-concrete bridge over the Leeds and Liverpool Canal, in Carr-road :—

*Yorkshire Hennibique Contracting Co., Ltd.

MANCHESTER.—Tenders accepted by the Corporation :—

For patent combined charging and discharging machine, for Bradford Gas Works : *Messrs. Drakes, Ltd., Halifax.
For 12 in. solid drawn steel tubes and special castings : *The Engineering Supplies Co., Ltd., London.
For supply of galvanised pipes, &c., to the Elm-street Cold Air Stores : *H. B. White & Co., Manchester.
Steelwork, &c. : *Hall & Pickles, Ltd., Manchester.
For removal and re-erection of footballers' hut in Heaton Park : *Forshaw & Co., Manchester.
For supply of pitch and creosote oil : *Hardman & Holden, Ltd., Manchester.
For draining, curbing and flagging (artificial flags), and paving with granited rock asphalte, various roads in Levenshulme and Withington : *Bethel & Son, Bale.
For draining, curbing and flagging (natural flags), and paving grit sets, Ford-street and Orchard-street, Burnage : *Thomas Wilson, Pendleton.
For draining, curbing, paving, &c., passages behind Ford-street and Orchard-street, Burnage; and Mount-road and Balmoral-road, Gorton : *G. Clark & Son, Hulme.
Supply of ironwork for twelve months : *H. Hughes & Sons, Failsworth.
For electric light installation at Davyhulme Sewage Works : *Hall & Stinson, Ltd., Sheffield.
For supply, delivery, and erection of double sand-drying apparatus at Hyde-road Depot : *Vickers, Ltd., London.
For supply of vacuum cleaner for cleaning tram cars : *Dod Bros., Manchester.
Special track work (Contract No. 23) : *The United States Steel Products Co., Ltd., London.
Welsh granite setts : *Penmaenmaur and Welsh Granite Co., Ltd., Liverpool.
Welsh granite setts (subject to approval of samples in bulk) : *H. Griffith, Blaenau, Festiniog.
Norwegian granite setts : *Isherwood Bros., Ltd., Manchester.
For alterations to dwellings, &c., at Pollard-street Fire Station : *W. Richardson & Co., Manchester.
For electric light installation at houses on following estates—Blackley, Clayton, and Catterick Hall : *W. Spreadborough, Manchester; Newton Heath : *E.L. Bellhouse, Manchester; Anson : *J. V. Pyatt, Manchester.
Construction of ducts for hot-water supply, Blackley Estates : *Geo. Longden & Son, Ltd., Swinton.

MELTON MOWBRAY.—For constructing large reservoir, storage tank, new high level tower and tank, and other appurtenant works, for Waterworks. Messrs. W. R. Radford, of Nottingham, are the Council's consulting engineers :—

*The Monnoyer British Construction Co., Ltd.

MILL HILL (SUNDERLAND).—For the construction of the Mill Hill reservoir, the larger of two service reservoirs to be built for the Sunderland & South Shields Water Co. The reservoir will hold 12,000,000 gallons, and will be completed early in 1925 :—

*Brims. & Co., Ltd., Westminster.

NELSON.—For a reinforced concrete retaining wall at Brierfield Works, for Nelson Corporation (six tenders were received) :—

*Simplex Pipes, Ltd., London.

Steam roller for tarmacadam road :

*Aveling & Porter, Rochester.

NEWBIGGIN.—For erection of 20 houses, for the U.D.C. : —

*J. T. Bell £7,086

OAKHAM (RUTLAND).—For the erection of Rutland Cottage Hospital (memorial to officers and men of the county who fell in the Great War) :—

*Higgs & Sons, Oakham £7,099

ROMSEY.—For repairs and alterations at Council School, for the Southampton C.C. :—

*W. G. Chivers & Sons £457

ROTHERHAM.—For the erection of two houses on the East Dere Estate, for the T.C. :—

*Hanwell & Co., Rotherham..... £1,050

SALFORD.—For extensions to Adelphi Iron Works, Salford, for Sir James Farmer & Sons. Messrs. Wood & Sellers, architects, 78, King-street, Manchester :

*J. Gerrard & Sons (1920), Ltd., Swinton.

SOMERTON (NEWPORT).—For the erection of 38 new houses at Somerton, Newport, for the Corporation :—

*Unit Construction Co., Ltd. £14,120 15

STAFFORDSHIRE.—For completion of administrative block at Prestwood House Sanatorium, for the Staffordshire, Wolverhampton and Dudley Joint Committee for Tuberculosis :—

*J. E. Tooby, Wolverhampton..... £7,649

STAFFORDSHIRE.—For installation of electric light at Groundslow Sanatorium, for the Committee :—

*Smith & Bellhouse, Wolverhampton.. £575

WAKEFIELD.—For the erection of new block at St. John's Nursing Home. Mr. W. Harold Watson, Architect, Barstow-square, Wakefield :—

*W. Kitson & Son—*Mason.*
*M. Broadhead—*Joiner and Carpenter.*
*M. Sedgwick—*Slater.*
*W. Gillott—*Plumber*
*T. Senior—*Plasterer.*
All of Wakefield.

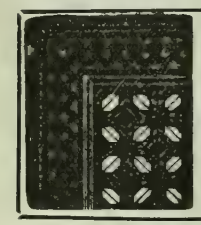
WAKEFIELD.—For the erection of two houses in Aberford-road, for Messrs. Massie & Holdsworth :—

*J. Lazenby—*Builder and Joiner.*
*H. Gillott—*Plumber.*
*T. E. Senior—*Plasterer.*
*C. Turner & Son—*Painter.*
All of Wakefield.

WAKEFIELD.—For the erection of bungalow at Chapelthorpe, for Messrs. Massie & Holdsworth :—

*J. Marshall & Son—*Builder.*
*W. Bramald—*Joiner.*
*T. E. Senior—*Plasterer.*
*J. E. Crossley—*Plumber.*
*C. Turner & Son—*Painter.*
All of Wakefield.

WANTAGE.—For repairs to roof of Victoria Cro Gallery, for the U.D.C. :—



*British Challenge Glazing Co.....£250

YORK.—For the erection of 50 houses at Tang Ha Estate, for the Housing Committee :—

*J. Gleeson, Sheffield £18,997

Adelaide House.

In the advertisement of Messrs. Scaffoldi (Great Britain), Ltd., on page ix of our issu of August 10, the name of the contractors und the block showing the heavy suspended scaffo at Adelaide House was inadvertently given Messrs. John Mowlem & Co., Ltd. This shoul of course, have read Sir Robert McAlpine Sons.

THE BUILDER

A JOURNAL FOR THE ARCHITECT AND CONSTRUCTOR

WITH WHICH IS INCORPORATED "THE BRITISH ARCHITECT."

VOL. CXXV.—No. 4203. AUGUST 24, 1923

THE NEW HOUSING ACT.

THE Housing, &c., Act, 1923, is now law, and although we have strongly criticised its defects, and more especially its omissions, we sincerely hope that everyone concerned, including the local authorities, will co-operate to make it a success. We recommend to those interested a perusal of the Ministry of Health's official circular (*see p.* 291), in which the Act is explained, and which contains instructions and advice as to construction, density, planning, and amenity generally. The principal changes made in the Bill during its passage through the House include :—

(*a*) The maximum area of houses or flats eligible for subsidy has been increased from 850 square feet to 950 square feet in the case of two-storied cottages, and from 780 to 880 square feet in the case of one-story cottages, bungalows, or flats.

(*b*) Where a local authority satisfies the Minister that, having regard to the special circumstances of its area, there is a need for houses of smaller dimensions, he may permit houses of smaller size than the normal minimum to rank for financial assistance. Such permission will be granted only for such limited number of houses for a particular area and subject to such conditions as the Minister may determine ; the minimum sizes in these special cases will be 570 square feet for two-storied houses, and 500 square feet for flats or one-storied houses.

(*c*) Every house or flat to be eligible for subsidy must be provided with a fixed bath unless the Minister, on the recommendation of the local authority, approves otherwise.

Amendment (*a*) is, of course, designed to admit the parlour house, and we hope the Ministry will refrain from any attempt at cutting out the parlour by circuitous methods. Public opinion has made it abundantly clear that it considers the parlour an important adjunct to the working-class house ; and where there is a demand for the parlour the Ministry will be ill advised if it attempts to stifle it. We emphasise this point because it appears that friction has already set in. The second amendment, which allows of reduction in the size of the already small houses to be subsidised, can no doubt in certain circumstances be used beneficially, principally by the larger bodies such as the London County Council ; but it will need the most careful scrutiny on the part of the Ministry to prevent this relaxation being abused by certain smaller and less responsible bodies who may be tempted to build inadequate houses merely because they are cheap. As to the provision of the fixed bath, this is now recognised as a necessity, and it does not redound to the credit of the Ministry that no such condition was originally included. Local authorities would, however, be wise to satisfy themselves that baths are not fixed in overcrowded sculleries, which would constitute an evasion of the spirit if not of the letter of the Act.

Section 12 empowers the Minister, in order to facilitate the erection of dwelling houses, to prescribe a code of by-laws with respect to the level, width and construction of new streets ; and provides that any local authority may by resolution adopt the prescribed code in whole or in part in substitution for such of its by-laws or provisions in any local Act as may be specified. The local authority is required before passing its formal resolution to give notice in the local press, and within seven days after passing its resolution to send a copy to the Minister. The code of by-laws to be prescribed is now in preparation. Section 13 re-enacts section 44 of the Housing, Town-Planning, &c., Act, 1909, amended in accordance with the recommendation of the Departmental Committee on Building By-laws ; and provides that the Minister may revoke any by-laws which, in his opinion, hinder or are likely to hinder the erection of buildings.

The above paragraph, taken from the Circular, explains how the new Act will affect the by-laws. In one respect it leaves us little better off than we were before, because, while a sympathetic local authority will be given a free hand to exercise common sense, those authorities who have shown themselves lacking in initiative, and who still apply their by-laws exactly as they did in 1910, will be able to go on in exactly the same way, knowing that appeals to the Minister are so cumbrous and take up so much time that nine out of ten have not the energy to face them. Section 24 of the Housing, Town Planning Act, 1919, although quite clear in its wording and intent, has too often been disregarded by local authorities to the delay or even abandonment of schemes. This, however, is not the fault of the Ministry, and we suggest that the Royal Institute of British Architects and the National Federation of House Builders should seriously take up complaints on this score from their members.

While the Ministry has, in our opinion wrongly, refrained from stipulating any maximum density for these State-aided houses, a lead is given in the Circular to the effect that "a density of approximately twelve houses per acre represents a desirable standard, and as a general rule a local authority should not approve the building of more than twenty houses on any one acre." The Ministry was no doubt influenced in its decision by the undoubted fact that, where there is a real and legitimate need for extra small houses, it is possible to build them satisfactorily, with care and knowledge, at a density rather greater even than twenty to the acre. But such freedom as is here allowed is so easily abused that it would have been wiser to make it compulsory on all authorities who proposed to build at a greater density than twenty to obtain special sanction from the Ministry, and we do not see how the Ministry can evade the charge that it has produced an Act of Parliament allowing public money to be spent on subsidising houses at fifty to the acre, and to do this is not consistent with being a "Ministry of Health," whose essential function should be to safeguard public health, and not to trust to luck or unknown bodies. This Act transfers a tremendous responsibility from the Ministry to the shoulders of the local authorities, large and small, and it is sincerely to be hoped that the Ministry's confidence will be proved justified.

NOTES.

Housing Trouble Begins.

We know no more than what has been published in the dispute between the Maldens and Coombe Urban District Council and the Ministry of Health, but we see it is alleged by the Council that the Ministry refuses to subsidise three hundred houses erected by the Council on the ground that the Minister is not satisfied that the need for houses could not be met without assistance. It is further alleged that the Ministry is now confining the subsidy to houses of the non-parlour type. In our original criticism of the Bill we pointed out the unfairness of placing the onus on the local authority of proving that the need for houses "cannot be met" without assistance, and we added that such a proviso was likely to cause endless bother and argument. We give the Ministry's case on p. 300, but we cannot help being biassed against a Government Department that deliberately worded an Act to give itself practically unlimited and autocratic powers of deciding where houses may be built but did not consider it necessary to maintain a worthy standard.

Subsidies for Parlour Houses.

Experience has taught us that Government control too often means that the Government says one thing in public and does another in private, and we should not be in the least astonished to find that it does not intend to allow parlour houses to receive assistance, even though it had to give way in principle owing to pressure of public opinion. It seems that the method it has in view to evade the obligation of subsidising parlour houses is to say that "the Minister is not satisfied that the demand for parlour houses cannot be met without assistance," and this excuse can be used with impunity anywhere. Public opinion has clearly shown that the people of this country believe that the working-class house includes the parlour house, and it is not for the Ministry of Health to take up the line that it does not. We hope that local authorities will at once make public any attempt on the part of the Ministry to get behind the spirit that Parliament intended should operate under the Act.

Fig. 1.—Bench-end at St. Mary's, Mortehoe, N. Devon.

Town Planning.

The model clauses recently issued should act as a fillip to the preparation of town-planning schemes. It is of immense importance that the country as a whole, and more particularly the districts specially concerned, should be acquainted with what is being done, and we would urge those Councils who have made definite progress to use every endeavour to interest the community at large by publishing particulars of their schemes in the lay Press. It is hard to see why the local paper should not regard the progress, or lack of progress, in its town planning as matter for "copy." It should at least be as interesting as most of the available material, on the collection of which considerable time and ingenuity has to be expended every week.

Methods of Building.

The organisation of employment at the time of the building of the Bank of England, as described in our last week's issue by Mr. A. T. Bolton, offers an interesting commentary on the vast changes in the method of employment since that time. Instead of the independent groups of tradesmen working under the architect, the organising contractor has taken their place. If this former method of building secured "the high evel of workmanship to which the durability of the Bank is a witness," as noted by Mr. Bolton in his very illuminating account, it is a thing to ponder over whether these large corporations supply anything like the scope and freedom of initiative secured by the former, and we may ask ourselves whether present methods are at all the last word in building construction.

Co operation.

In writing to us on the subject a correspondent says: "In drawing a number of independent groups of tradesmen, working harmoniously, together, we see that there is another sort of unity and discipline other than that of 'militarism,' and a freedom which those who, like Mr. Maxwell Aylwin, uphold this latter view are compelled to deny. Results are more practical guides than theories, and my own view leads me to favour a co-operation formed on more natural lines. The development of the small industry and the co-operation between independent workers is less machine-like than the more centralised method, and it cannot be objected to on the score of inefficiency, seeing the beautiful work which has been the result of it. And this should direct us to give all encouragement to the small workshop and that better kind of co-operation, the result of true freedom, instead of more coercive methods; a co-operation wherein the worker is so much nearer to his work and in more direct control of its efficiency. Standardisation gives us standardisation, as witness recent buildings in London, but it detaches the human interest, and offers us a mask instead of life itself. Sculptural or other ornament when added to such construction has a strange and unattached appearance, for it is seen not to grow out of and be the flowering of it, but is a contradiction of its whole purpose. If we accept standardisation for architecture it appears to me better to keep anything more personal away from it altogether."

Fig. 3.—Bench-end at St. Mary's, Mortehoe, N. Devon.

Plan and Elevation.

Lord Sumner made a point in his recent lecture, when he said he failed to see why the exterior aspect of a building should explain the interior construction. He said, "I see no point in requiring that a building should carry out in its elevation some arbitrary code about its interior moral character." His remarks on architecture were stimulating and useful, but even his sensible and often trenchant comments might be taken in a way not

altogether satisfactory. For instance, it is easy to write down "styles," or the love of the picturesque, but architecture is too complex a matter to be summed up in statements entirely positive or negative. To estimate the value of style we have only to consider the many modern attempts at originality, where hardly an echo of any style has appeared, to realise that the term style does mean something. We urged last week a better consideration for modern design, but we can well understand that people may feel satisfied and safe in the purchase of old Tudor, Jacobean or French furniture, whilst they eschew the many curiously uncomfortable looking things which modern thought has evolved, and particularly so much of what appeared in the Arts and Crafts Exhibitions—odd, costly, and "precious." With all his discrimination and enthusiasm, Lord Sumner can say, "Even the Victorian age, in spite of the Houses of Parliament and the Victoria Tower, had its great architects." We wonder what this means. A very good critic once said that the Victoria Tower was the one outstanding fine thing in London. It is well for a clear speaker like Lord Sumner to tell the public what he thinks about our hideous shop fronts, our Hotel Cecils, our uncontrolled misuse of advertising names and devices, and the terrible jumbles at Charing Cross and Cannon-street, or the lamentable failure at the Marble Arch, which had such great possibilities. What we want is the will and opportunity to take such criticism seriously and *do* something. What is being done now to bring into real action those qualities of forethought and design, the lack of which filled London with lost opportunities?

Fig. 2.—Bench-end at St. Mary's, Mortehoe, N. Devon.

Bench-ends in Mortehoe Church, North Devon.

The ancient and interesting church of St. Mary, Mortehoe, near Ilfracombe, possesses a very remarkable series of beautifully carved bench-ends along the seating of the nave and one of the aisles. The Rev. T. F. Daffen, vicar, enables us to reproduce a few typical examples, from which the excellence of the carving and the quaintness of the art may be gathered. Fig. 1 belongs to a series illustrative of the Passion of Our Lord, and shows the "thirty pieces of silver" on a shield in one panel, and an object resembling a lantern in another, also on a shield. The date appears to be towards the end of the fifteenth or commencement of the sixteenth century. Another of this series (Fig. 2) shows the ladder and the hammer, implements also connected with the proceedings carried out at the Crucifixion. The shape of the shield is reminded of that which occurs on seals and carvings of the period of the decline of Gothic details in English architectural work. Figs. 3 and 4 show remarkable costume subjects, which are worthy of notice. In Fig. 3 it is curious to find a cross pendant attached to a necklace or band worn by a Blackamoor, and the embroidery of his apparel, the tassels of his headgear and collar, cannot fail to attract the student of historical costume. In Fig. 4 the treatment of the beard and whiskers and the patterns of the cap rim, vest and coat, testify to the exuberance of the artistic feelings of the engraver.

About Glass Painters.

We feel quite inclined to accept the statements of Mr. Knowles as to the mediæval artists which he made in his lecture (*see page* 294), nor are we much perturbed to know that they sometimes fell short of perfection, as it is a little tiresome when everything, just because it is mediæval, is sacrosanct and become rather a superstition. But it would also be a pity if a wrong impression was gained from the discovery that mediæval glass-painters were men like ourselves, very far from perfect, ready to use their old cartoons in some cases, when they should have made new ones, and laying themselves open to the charge of pot-boiling on occasions, while their subject matter was very much in the hands of the political parties of the time. All this may be true, yet we should woefully misread the inference to be properly gained from it if the modern commercialist in glass were to lay the flattering unction to his soul that such attributes in the old work established his own equal claims as only doing like unto them. There is an adage of particular appositeness in this connection, which says that "while one man may steal a horse another cannot look over a wall." And if we take the work of the mediæval glass-painters as a whole, we find that general intimacy of treatment and endowment which belongs to the real artist, whatever his peccadilloes, always pushing through in evidence of delight in his work, and so we may forgive him the rest. But if we have no delight, and stained glass is merely the rechauffé of old patterns and types, a dull round of plagiarism only, fastened to outworn conceptions, such work is not raised to the level of mediæval glass because it has all the faults and none of the virtues.

Fig. 4.—Bench-end at St. Mary's, Mortehoe, N. Devon.

The Housing Act.

We recommend builders who are anxious to understand the new Housing Act, but who have not perhaps the time or energy to master the Act itself or its accompanying official Circular (which we abstract on p. 291) to study the summary issued, with notes on the preparation of building schemes under the Act, by the National Federation of House Builders, of 57, Victoria-street, S.W.1. The whole Act and its application are here condensed into eight short pages, and the pamphlet should be of the greatest assistance in making the possibilities and conditions of assistance widely known.

GENERAL NEWS.

Professional Announcement.

Mr. P. T. Walters, P.A.S.I., chartered quantity surveyor, of Vernon House, Sicilian-avenue, W.C.1, has opened an office at 57, High-street, Oxford. (Telephone: Oxford 795.)

A Decorators' Exhibition.

A Decorators' Exhibition is to be opened on October 17, at the Holland Park Hall, London, W. It will contain exhibits of wall-papers, cretonnes, wall finishes, and other materials for house decorating.

A.A. School of Architecture.

A special visit was made last week by a number of architects to the Exhibition of A.A. School work, at 34 & 35, Bedford-square. The party was met by the Director of Education (Mr. Robert Atkinson), the Principal (Mr. H. M. Robertson), and some of the masters, who explained in detail the principles of training adopted at the Architectural Association Schools. Amongst those present were Sir John Burnet, A.R.A.; Mr. J. Alfred Gotch, P.R.I.B.A.; Mr. Maurice E. Webb; Mr. E. C. P. Monson; and Mr. H. M. Fletcher.

Northumberland Archaeological Society.

About fifty members participated in the third tour of the season of the Northumberland Archæological and Architectural Society. The route was through the southern portion of the County of Durham; and Mr. W. H. Wood, of Newcastle, acted as guide.

Clitheroe War Memorial.

Clitheroe Castle and estate of ten acres, which have been purchased by public subscription for £9,500 for presentation to the town of Clitheroe (Lancs) as a war memorial, were formally handed over to the Corporation on Saturday. A cenotaph erected in the grounds was unveiled.

The Archbishop's Palace, York.

The Archbishop of York, in a letter to the diocese, explains the object of a loan from the Ecclesiastical Commissioners. His Grace says the object of the loan is to pull down a number of useless stables, which will make it easier to meet the already heavy cost of maintaining Bishopthorpe Palace. It will involve removal of parts of the old building, but the central part will remain, with all its old features.

Newcastle Housing.

Newcastle Corporation Housing Committee, at a meeting held on August 16, resolved to erect an additional 60 houses on the Pendower Estate, and to invite tenders.

The meeting also decided to propose to the City Council that a subsidy of not more than £100 per house be given to private builders, the houses to be within 950 superficial feet for two stories, and 880 superficial feet for flats or bungalows, the subsidy to be subject to conditions as to approval of plans, &c., which are at present being attended to.

Sketching Tour in Normandy.

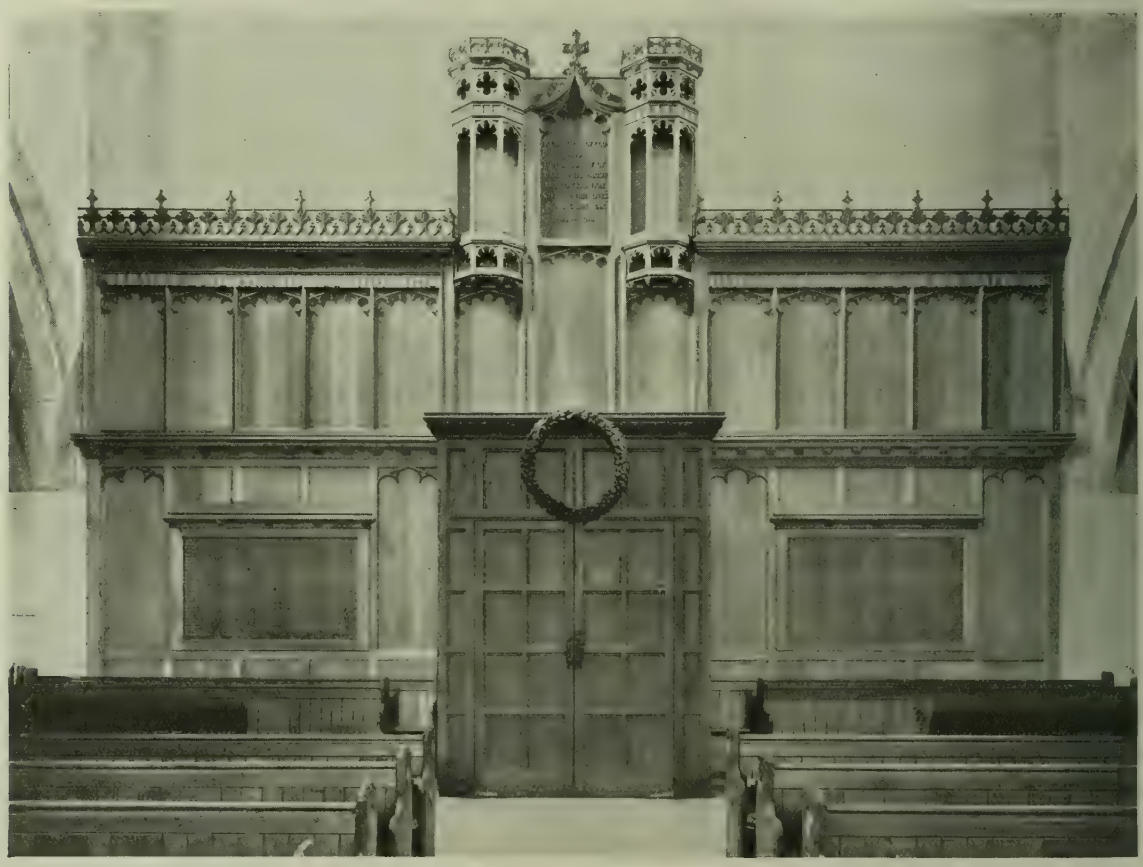
A sketching tour in Normandy is being organised, in which architects and their friends are invited to participate. The party will leave London on the evening of September 10, returning on Saturday morning, September 22, The cost will be £15 15s., including first-class on steamer, second class on rail in France, third in England, and hotel accommodation, but exclusive of wines, &c. Further particulars may be obtained from Mr. G. A. T. Middleton, A.R.I.B.A., Hartley, Cranbrook, Kent.

Obituary.

Mr. Charles Steward Smith, J.P., F.R.I.B.A., of Reading, died on Sunday, after an operation. Mr. Smith, who was born in 1858, was the eldest son of the late Mr. Charles Smith, J.P., F.R.I.B.A., of Reading, a well-known local architect and surveyor, and twice mayor of the borough, and on becoming qualified to practise as an architect carried on business first with his father and afterwards with his father and Mr. Harry Hutt, A.R.I.B.A., under the style of Charles Smith & Son.

The A.A. Excursion.

The following arrangements have been made for the Architectural Association Excursion to Avignon and District, from September 6 to 18. The headquarters will be at the Hotel du Louvre, Avignon:—



Thursday, September 6.—Meet at Victoria, Continental Platform, at 7.30 p.m. The party will leave Victoria at 8 p.m. and travel *via* Dover and Boulogne to Paris (5.15 a.m.). Train leaves Paris, Gare de Lyons, for Avignon at 8.35 a.m., arriving at Avignon at 7.34 p.m. Carriages will be reserved and arrangements made for the transport of the party across Paris.

The party will leave Avignon on the morning of Monday, September 17, by the 10.41 a.m. train, arriving in Paris at 10 p.m., and leaving Paris, Gare du Nord, at 11.45 p.m., arriving in London on Tuesday morning, September 18, at 9.48 a.m.

In Avignon particulars will be issued of the most important places to be seen in the neighbourhood, together with details of trains, fares, &c. Members will be free to make their own arrangements, but excursions will be organised from day to day according to the wishes of members. Particulars as to cost, &c., may be obtained from Mr. F. R. Yerbury, Secretary of the Association, 34 and 35, Bedford-square, W.C. 1.

COMPETITION NEWS.

Competition news this week is on p. 280.

War Memorial, St. John's Church, Southall.

Mr. C. G. Miller, Lic.R.I.B.A., Architect of the Church.

[This memorial was recently unveiled by Commander Burney, C.M.G., M.P., and dedicated by the Archdeacon of Middlesex.]

MORE ÆSTHETIC THEORY.*

"The author is a friend and disciple of Mr. Ouspensky, and his works should be considered in relation to *Tertium Organum* as a companion to it. This is, perhaps, the best book dealing exclusively with the mystical and mathematical basis of the arts of design, particularly architecture. The first essay is philosophical and historical. The following three essays are devoted to the formulation of 'the rhetoric of the language of form,' the discovery of those universal and unchanging laws to which every worker in the arts of design must needs submit himself. The final three essays are devoted to the mathematics of design" (Prospectus).

"*The Beautiful Necessity* was first published in 1910. . . Fifteen years elapsed between its beginning and completion. . . Confronted now with the opportunity to revise the text again, I find myself in the position of the surgeon who feels that the operation may harm more than it can help. . . . I feel that any injection of my more mature and less cocksure consciousness into this book might impair its unity—that I never could recapture the first fine careless rapture. . . *The Beautiful Necessity* contains nothing that I need repudiate or care to contradict. Its thesis is that art in all its manifestations is an expression of cosmic life, and that its symbols constitute a language by means of which this life is published and represented. Art is at all times subjected to the *Beautiful Necessity* of proclaiming the world order. In attempting to develop this thesis it was not necessary to link it up in so definite a manner with theosophy . . . its removal now might seem to imply a loss of faith in the fundamental tenets of theosophy. . . The one important influence that has operated to modify my opinions concerning the mathematical basis of the arts of space has been the discoveries of Mr. Jay Hambidge, with regard to the practice of the Greeks, and named by him *Dynamic Symmetry*. In tracing everything back to the logarithmic spiral (which embodies the principle of extreme and mean ratios) I consider that Mr. Hambidge has made one of those generalisations which reorganises the old knowledge and organises the new. . . . *The Beautiful Necessity* represents my own prospecting; *Dynamic Symmetry* represents his. . . If he convicted me of error his work would remain the greatest justification of my contention—that art is an expression of the *world order* . . . and susceptible of mathematical analysis." (Preface.)

"One of the advantages of a thorough assimilation of what may be called the theosophical idea is that it can be applied with advantage to every department of knowledge; like the key to a cryptogram, it renders clear that which before seemed obscure. . . Everything is the expression of the self in terms of sense. . ." (Chapter I.)

"Architecture (like everything else) has two aspects: it may be viewed from the standpoint of utility, that is as construction; or from the standpoint of expressiveness, that is decoration. No attempt has been made to deal with its first aspect, and of the second (which is again twofold), only the universal, not the particular expressiveness, has been sought. . . The inductive method has not been honoured by due observance. . . With the acceptance of the Ancient Wisdom the inductive method becomes no longer necessary. Facts are not useful in order to establish a hypothesis; they are used rather to elucidate a known and accepted truth. When theosophical ideas shall have permeated the thought of mankind this work, if it survives, will be chiefly remarkable by reason of the fact that it was among the first in which the attempt was made again to unify science, art, and religion as they were unified among those ancient peoples when the Wisdom swayed the hearts of men." (Conclusion.)

The seven essays are entitled:—I, The Art of Architecture; II, Unity and Polarity; III, Changeless Change, Trinity, Consonance, Diversity in Monotony, Balance, Rhythmic Change, Radiation; IV, The Bodily Temple; V, Latent Geometry; VI, The Arithmetic of Beauty; VII, Frozen Music.

There are many diagrams having schematic lines (mostly triangles, squares, and circles), some with a musical notation, and others with elucidatory remarks ("7 as 3 and 4," "7 as 2, 2 and 3"). "The column, the entablature and the arch correspond to lines vertical, horizontal and curved." In the text are dissertations on "In and Yo in their myriad manifestations"; "the sacred syllable *Om*, which epitomises all speech"; "Number which is the within of all things—the first form of Brahman," etc.

The author writes from Rochester, New York, and has also published "Four-dimensional Vistas: A sincere and reverent effort to throw the light of the mathematical concept, called 'The Fourth Dimension,' upon the mystic depths and feeling from which spring action, morality, aspiration." It has seemed better to give an account of this volume in its own words rather than attempt any ordinary reasoning about it. The title is founded on a fine saying by Emerson—"Let us build altars to the Beautiful Necessity." To which the reviewer would add—and the sooner the better without more unnecessary words.

W. R. Lethaby.

Designed and carved by Mr. John E. Hyett.

Northern Architectural Association.

There was a good attendance of members of the Northern Architectural Association at their outdoor meeting, held at Durham last week. The assembly included several from the recently formed Tees-side branch, which is making excellent progress. The party first visited the Castle, where the President (Mr. W. T. Jones, F.S.A., F.R.I.B.A.) conducted them around the buildings and explained the history of the Castle and the numerous points of architectural interest. Subsequently, tea was partaken of at the invitation of the President, to whom a cordial vote of thanks was accorded.

CORRESPONDENCE.

[While we are glad to publish letters on professional and other matters of interest to our readers, it must be understood that we do not necessarily endorse the remarks of correspondents, who will oblige us if they will express their views as briefly as possible.]

The Conduct of Competitions.

SIR,—Now that competitions are again being so freely instituted their right conduct is of much importance. It seems to me that there is a very confused idea as to the object of a competition, more especially amongst the promoters. If the object is to discover a satisfactory design it is often enough a failure, but if the object is to discover a capable architect it is often enough a success. The two recent competitions for pleasure houses at Bournemouth and Tunbridge Wells have shown how poorly an architect appreciates the appropriate treatment of the subject, but in both cases the result of the competition has led to the selection of a capable architect. If the result has shown what is not wanted (and that so often happens!), it has disclosed able plans and architects who ought to be able to give right expression to them. I, for one, do not believe in the collective wisdom of the jury system. I have sat on too many committees to believe in that! I would prefer to trust myself to the ability and honesty of a capable assessor. The competing architects ought themselves to be the best judges, and it would be both instructive and interesting to try the experiment of the competitors' agreement as to the second best design.

"AN OLD HAND."

London.

Tunbridge Wells Pavilion Competition.

SIR,—With reference to the article by Mr. Howard Robertson in your issue of July 13, I think the assessor's awards in the recent Tunbridge Wells Pavilion Competition call for further comments on the present methods of adjudication.

In the first place it is obvious that the arrangements for the majority of competitions are the result of numerous meetings of public or other bodies, and I do think that in the judging of the various designs sent in at least one member of such committees should act in the capacity of co-adjudicator, together with an architect who specialises in the particular class of work put out for competition, and, to form a complete jury, a third person of sound practical and constructional experience.

Second, I am of the opinion that the names of the assessors should not be divulged until the awards have been made; and third, as regards the actual conditions of competitions, it would be much better if the clause relating to questions and answers be ruled out completely. The conditions could, and ought, to be drawn up in such a manner as to obviate the necessity of any questions by the competitors.

As a competitor in the Tunbridge Wells scheme, I venture to state (with all due respect, and without prejudice either on the part of assessor or competitors) that the assessor has omitted to take into consideration in making his awards the conditions as drawn up, and his answers to the questions in conjunction with them.

One particular clause in the conditions states that the stage should provide accommodation for 60 to 80 performers with dressing rooms for artists on each side. In the answers to the questions it will be observed that the dressing accommodation should only provide for from 12 to 15 persons of each sex. This is just one item taken at random to illustrate my point, but there are a host of others.

Another bad feature in the conditions of this particular competition was the clause relating to the cubical contents of the main hall and accessory rooms, which was made far worse, in my opinion, by the published extract from the assessor's report. Here it was stated that the first premiated design was cubed by the assessor's quantity surveyors and found to be the only one of the selected designs that could be executed to-day within the stipulated amount of £25,000. Now, any person with a fair amount of experience will agree that it is an utter impossibility to arrive at even an approximate cost of a building such as desired in this competition on the basis of cubical contents, and even if this were the case of the first premiated design, the assessor has very evidently omitted to take into account the excessive cost that would be required in preparing and completing the site for this particular scheme. When a figure is stated in the conditions it is generally assumed to be the amount of the total outlay, unless specifically mentioned otherwise. A study of the contour of the land on the southern side of the building would reveal that for a greater part of its length the elevation would be spoilt and the light considerably blocked by the necessity of a substantial retaining wall. Further, a great amount of work would be required in excavation and laying out of the terraces surrounding the band stand.

There are many other features particular to this competition which clearly illustrate and confirm the views of Mr. Howard Robertson.

Referring to your article in this connection on the question of design, had your representative been granted a view of some of the other designs sent in it probably would not have been essential for you to publish and convey to your readers (and the assessor in particular) the fundamental principles in exterior design as called for in the conditions and more in keeping with the surroundings.

Here let me say that you were wrongly informed when told that the rejected designs were on their way back to their respective owners, as, at the present time, my plans are not yet to hand, but are still in the keeping of the Tunbridge Wells Council.

London. G. T. MORRIS.

COMPETITION NEWS.

Hull.

The assessor, Mr. Stanley Hamp, F.R.I.B.A., has made the following award in the Hull Cenotaph competition:—

First premium (£150): Mr. T. H. Hughes, A.R.I.B.A., 28, Ashton-terrace, Glasgow.

Second premium (£75): Messrs. H. G. Hall and R. G. Cox, 4, Balliol-road, North Kensington.

Third premium (£50): Messrs. Hendry & Schooling, AA.R.I.B.A., 43, Doughty-street, London.

The following are highly commended:—Mr. R. W. Dening, F.R.I.B.A., Orchard-street, Bristol, and Mr. C. T. Pledge, A.R.I.B.A., 88, Algernon-road, London, S.E. 13.

Eastleigh and Bishopstoke.

FOR THE U.D.C.—Designs for an assembly hall and extension of municipal buildings. (See advertisement this week.)

Chiswick.

FOR THE U.D.C.—Designs for constructing and laying-out a river embankment. Premiums: 100, 50 and 25 guineas. Sending-in day, October 15. Further particulars from the Clerk to the Council, Town Hall, Chiswick. *Banned by R.I.B.A.*

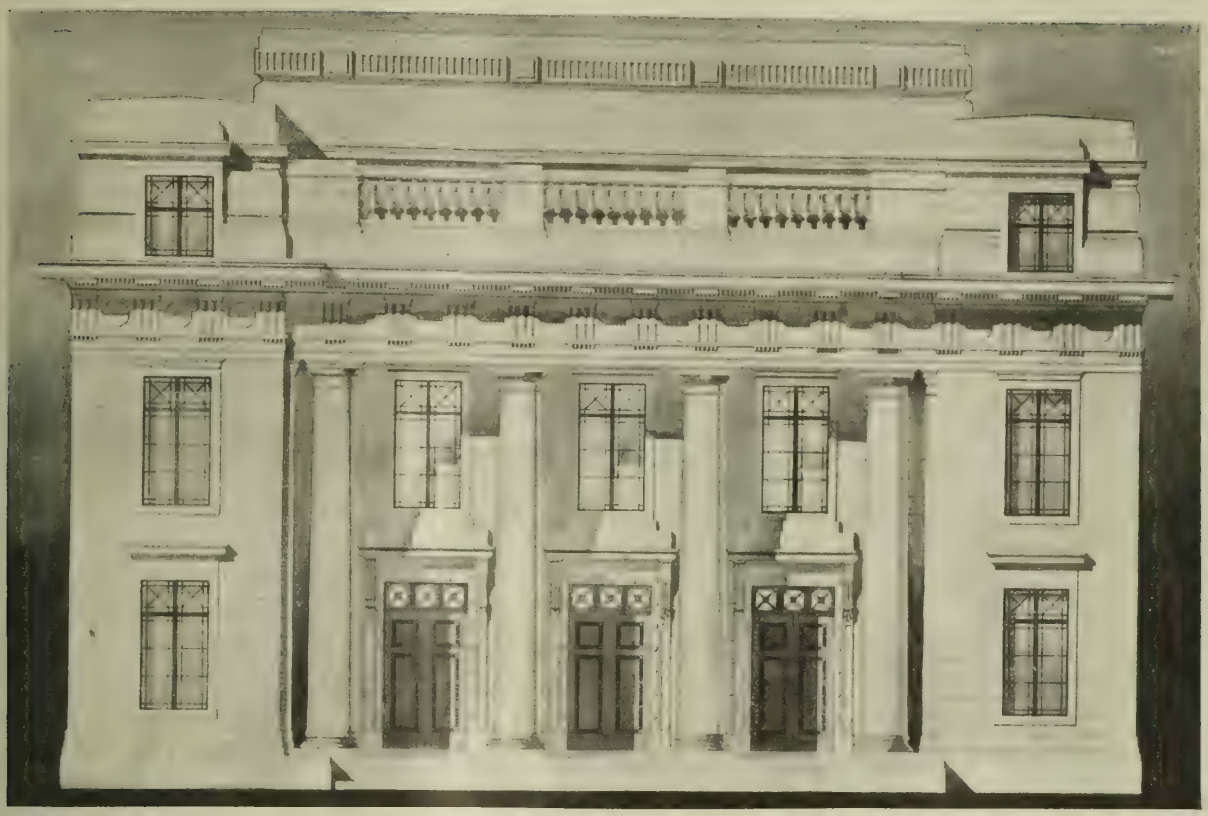
Swansea.

The sending-in date for designs for Swansea Masonic Hall competition is October 3.

Other Competitions.

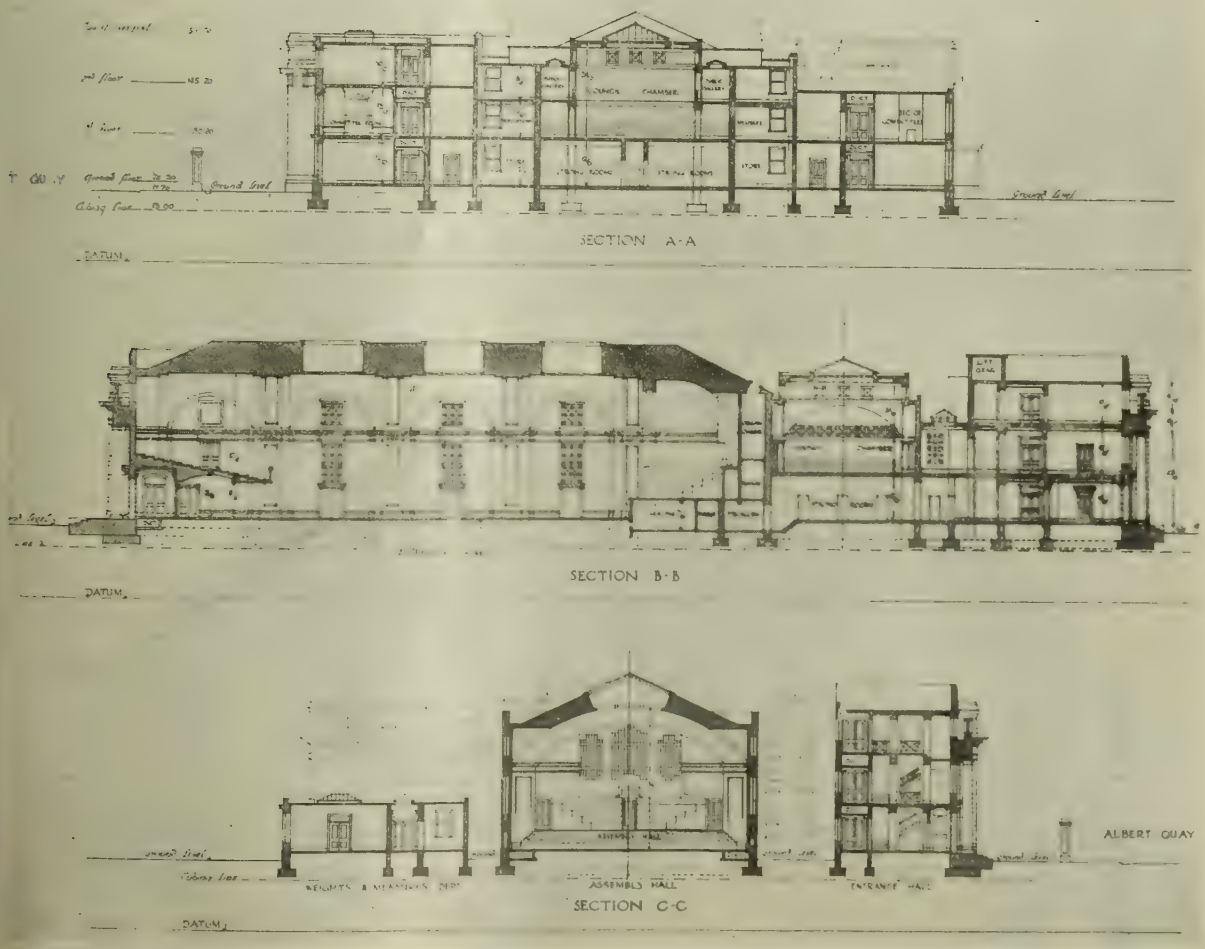
Other competitions still open include the following (the dates given are, first the sending-in date, and second the issue of *The Builder* in which full particulars were given):—Singapore College (Jan. 1, 1924; March 30). Greenwich Baths (Aug. 25; May 4). Hull Art Gallery (Nov. 5; May 4). Mint competition for plaques (Sept. 30; May 25). Birmingham Masonic Temple (Sept. 12; June 22). Colour scheme (Sept. 30; June 29). Memorials to the Missing (Jan. 1, 1924; Aug. 3). Wirral Infirmary (*Banned by R.I.B.A.*) Halifax Lay-out (*Banned by R.I.B.A.*).

INDIAN ART.*



So much is included in the word "Indian" that a popular description of Indian art naturally presents some extraordinary contrasts in text and illustration, for Buddhist, Hindu, and Mohammedan peoples all have separate styles of architecture and decorative art which obey arbitrary rules concerning subject, proportion and treatment. On one page a photograph of a mosque indicates the Saracenic love of plain surface and carefully considered contour, the striking use of large masses of shadow in recessed doorways and of delicate gradations of shade on domes; on another page a temple may exhibit the application of carved ornament in such high relief as destroys all sense of continuity of surface and seriously disfigures the silhouette of the building when considered as a mass against the sky. In the minor arts the same extraordinary variety is presented. From certain designs human and animal figures are rigidly excluded, in others they constitute the chief interest or are included as adjuncts to monstrous mythological beings possessed of arms, legs or heads in addition to the normal quota. Mr. Blacker makes no pretence of adjudicating between the claims of these incompatibles, but describes each object in connection with a brief account of the religion under which it has come into being.

This complexity has undoubtedly prevented Indian art being understood in England, and collectors have hitherto paid far higher prices for Japanese and Chinese works than for objects of Indian manufacture. Exception was made in the case of Kashmir shawls, and these really beautiful textiles enjoyed a brief vogue in Europe when Queen Victoria made a custom of presenting them to the ladies of her Court. The fame of Oriental weaving is world-wide, and some of the tissues produced are marvellously fine and soft. The custom in the East which insists on women veiling the face over head and eyes creates a demand for materials of such gossamer slightness as would be quite unfit for any ordinary use in Western costume. Instances are quoted of muslins which "became invisible when spread upon the grass and subjected to the dew."



In regard to "Delhi, the Imperial city," Mr. Blacker writes: "Delhi, the old capital of India from the time of the Slave Kings, has come back to its rightful position as the new capital. . . . The new buildings will, no doubt, be worthy of praise, but we hope that Indian sentiment with regard to their architecture will find due place, and we could have wished that the native architects might have been associated with their construction." The principal buildings are being carried out from the designs of Sir Edwin Lutyens and Mr. Herbert Baker, and although the sentiment of Indian architecture for India's capital may be very attractive it is doubtful whether the existing arrangements could be improved upon without a radical upset of all established methods of procedure and the snipping of a great deal of Departmental red tape. Damascening and inlay, enamels, furniture, jewellery and lacquer receive attention in turn.

The remains of Indian paintings in the Ajanta caves are compared with fourteenth-century European paintings by Italian artists, the same concentration upon truthful rendering of detail being observed in the Indian paintings and in those beloved by the Pre-Raphælite Brotherhood. The fluency of direct line drawing is remarkable in these colossal mural and ceiling decorations, though Indian art also includes, at the other end of the scale, the miniature works of the portrait painter and book illuminator carried to the utmost perfection of delicacy. Some sale prices of Indian works given in Chapter XXX show the low figures which these articles have brought in recent European auctions. The author gives collectors the advice to pick their bargains with discretion now, and wait for the change of fashion in artistic taste to enhance the value of their purchases.

THE DOME: ITS HISTORY AND CONSTRUCTION.—I.

By SIDNEY TOY, F.S.A.

In the four articles it is proposed to devote to this subject the dome will be treated mainly from a constructive point of view. The principles of construction adopted by the Romans, the Byzantines, the mediæval builders of Western Europe, the Saracens, and the architects of the Renaissance and of modern times will be briefly reviewed in succession. At all periods the restraints imposed upon the builders by the necessity for the employment of local materials and of workmen accustomed to local methods of construction have been of themselves productive of progressive steps in architectural development, since the difficulties thus presented have stimulated inventive genius, and in no case is this more evident than in that of the evolution of dome construction. Though it is not possible here to treat the subject extensively, it is hoped to examine the most salient features in this evolution.

The advantages of forming a roof by means of a dome were appreciated from the remotest periods, and although in such works as the Treasury of Atreus at Mycenæ, dating from about 1180 B.C., the principles of construction employed are in their earliest forms, it is doubtless from such types that the Roman, Persian, Syrian, and Byzantine forms were developed. In countries subject to frequent earthquakes, such as those of the Levant, it was of the first importance to discover a form of roof which should offer the greatest resistance to seismal disturbance, and the domical form was found to be the best suited to that purpose. That the conclusion of the Levantine builders was correct is amply proved by the great number of ancient domes which still remain and by the observations of a modern architect and writer, M. Auguste Choisy, who, on visiting a town in Asia Minor some months after the occurrence of a disastrous earthquake, was struck by the fact that the mosques which were roofed with domes remained intact while the surrounding buildings were in ruins.

Domes such as those at Mycenæ and Menidi were built on circular foundations, had their springing line near the pavement level, and, assuming a beehive form, were built throughout of stone in horizontal courses. Since the rise is rapid each succeeding course projects only slightly beyond that immediately below, and it is probable that the inside face of the structure was cut plain after the whole was built, as indicated by the shaded portions in Fig. 1, from the subterranean chamber known as the Treasury of Atreus at Mycenæ.

Little development in the construction of domes occurs before the period of the Roman Empire, and one of the earliest and most conspicuous examples of that period is the Pantheon at Rome, built about A.D. 123. This

Fig. 3.—The Temple of Minerva Medica, Rome.

dome forms the roof of a circular building, 142 ft. 6 in. internal diameter, and is constructed of brickwork in a most ingenious manner (Fig. 2). As shown on the right-hand side of the figure, a series of brick arches, which extend through the full thickness of the dome, and ribs form the skeleton or framework of the structure, while the main body of the work is composed of horizontal brick courses with bed joists inclined slightly outwards. The great arches at the springing of the dome occur above the recesses in the main wall of the building, and immediately below these are three arches which abut above the columns in those recesses. It has been often asserted that the dome of the Pantheon is built of concrete, but the actual construction as described above and outlined by Piranesi in his engravings of the building made during repairs in 1747, was clearly revealed by the investigations of M. Chedanne, who was granted special facilities for examining the Pantheon by the Italian Government, and presented his report, accompanied by a series of drawings, to the Académie des Beaux Arts in June, 1892. Owing to this method of construction in horizontal courses, and to the weight of the mass of brickwork at the haunches, little or no thrust is exercised on the walls, and the resulting pressure is vertical, but that the skeleton framework has not become so much a part of the general mass as to lose entirely its structural importance was demonstrated by M. Chedanne, who observed that where some of the lower arches had been cut into in 1747 cracks had developed in the superstructure. A coffered face of brick framework and stucco or light concrete infilling covers the dome internally, as shown on the left-hand side of Fig. 2. It is possible that this coffered portion was the first part of the dome to be built, the vertical ribs between the coffers resting on corresponding ribs of a timber centering, and that, when this was complete, the main mass of the vault was constructed upon it. The method of lighting adopted here, by means of a circular eye 27 ft. in diameter at the crown of the dome, was not pursued either by the architects of Rome or of Constantinople, and it was not until the period of the Classic renaissance that the principle was developed. This eye is still bordered with a bronze cornice, and the whole dome was originally covered with bronze-gilt tiles, but the latter were removed to Constantinople in A.D. 662.

The edifice called the Temple of Minerva Medica at Rome was probably built at least two centuries after the Pantheon. Here the dome, shown in Fig. 3, rises from a decagonal base and rudimentary pendentives are employed at the angles of the base to support the circular dome where it passes across them. This dome, the whole crown of which fell down about 1828, was composed of a series of ribs, springing from the pendentives and converging towards the crown, and of infilling masonry bonded together at intervals by brick lacing courses. Each of the main ribs consists at the springing of five members; but only the three middle members were carried beyond the haunches, the reduction doubtless being made on account of the diminished distance between the ribs as they converge towards the crown. In the centre of each panel between the main ribs are brick arches flanked by other ribs, all embedded in the general masonry. Buttresses are placed at the angles of the building so that they might receive the thrusts from the great ribs directly at the points at which they are exer

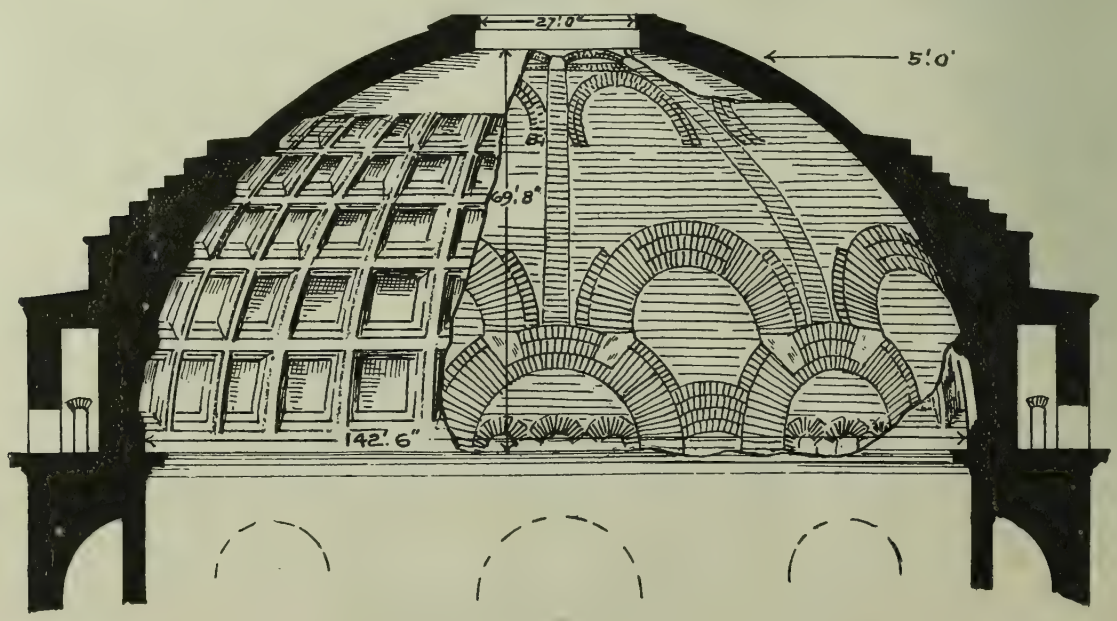

Fig. 2.—The Pantheon, Rome.

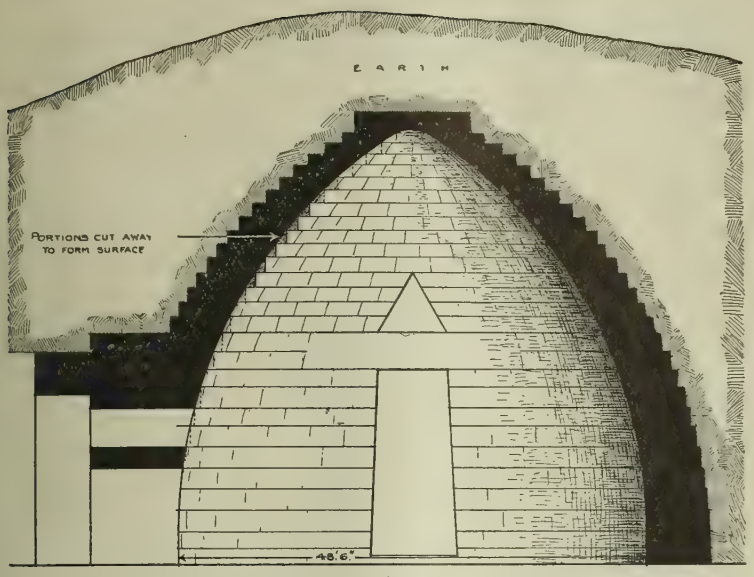

Fig. 1.—Treasury of Atreus at Mycenæ.

cised, thus manifesting a considerable development in scientific construction. This is probably the earliest existing example of the application of the principle of placing buttresses directly opposite points of concentrated thrust.

The bricks used by the Romans are flat and vary in size from 1 ft. 2 in. by 6½ in. to 2 ft. by 1 ft. on face, and are from 1½ in. to 1¾ in. thick; they are embedded in mortar joints of about the same thickness as the bricks themselves. The infilling work usually consisted of alternate layers of cement and broken stone or pebbles, bonded at intervals of about 3 ft. by brick lacing courses. Large earthenware jars were incorporated in the substance of the dome of the Torre Pignattara or tomb of S. Helena on the Via Labicana, near Rome, built about the early part of the fourth century. These jars were doubtless used here simply to lighten the material of the dome itself, but there are indications where they are found in similar positions elsewhere that such jars were also employed to impart resonance to the edifice in which they were built, and represented an adaptation of the use of acoustic vessels as mentioned and elaborated by Vitruvius. In a ruined cupola at Nicæa large earthenware jars have been found buried in pairs in the substance of the material, with their necks directed towards the interior.

At Nocera de Pagani, near Salerno, is a baptistry which was probably built in the latter half of the fourth century, about fifty years after the tomb of S. Costanza at Rome, to which it bears considerable resemblance in plan (Fig. 4). Here the central space is surrounded by an ambulatory and covered by a dome which rises in an ovoid form above a circular arcade with twin columns. This dome is built of stone courses, the bed-joints of which are horizontal in the lower part but inclined in the upper part of the shell. It is pierced by a row of windows immediately above the haunches. A circular drum, carried up externally from the haunches, enables the dome itself to be covered in by a timber roof and this is probably the earliest example of a principle of construction which was extensively adopted by the Italian architects in later buildings of a similar character, and in its wider application to vaulting generally became the accepted rule throughout Europe.

Ashlar masonry was very little used in the construction of domes. The dome of the round temple at Baalbec, dating from A.D. 273, and several cupolas at Djerach of about the same period, were built of ashlar. In these examples the bed-joints of the voussoirs radiate towards a centre within the dome, much in the same manner as in modern work of this character, and must have been built upon substantial centering. But ashlar domes, the stones of which were accurately cut and fitted together—in some cases without mortar—were too expensive for general use and were rarely adopted.

PROTECTIVE TOWN-PLANNING.

By EWART G. CULPIN.

Town Planning has been discussed from many points of view, and its advocates have demonstrated how its application will ensure convenience and safety of traffic movements, how public health will be benefited, how the future town may be made more desirable by proper grouping of buildings and by the fixing of building lines and site planning, how monstrosities in building may be prevented, how noxious trades may be kept from harming a population, and how ease of development will be combined with economy. There is one aspect which does not so often come into the public eye, but it is one which, none the less, deserves attention, and which has great importance for a certain class of town, and especially for small towns.

There are many places in the country which rely for their chief asset and charm upon the natural beauty of their setting or upon some historic association. Some towns and places, such as Stratford-on-Avon, are examples of this. They do not attract the crowd which wants the noise and bustle of a Blackpool to give it pleasure. They do not rely upon the incursions of char-a-banc loads of trippers to provide a living for their tradesmen. And if they are wise they will never attempt to secure these things. Blackpool, which is the Mecca of many, is hatefulness itself to others; but bad as it may be for some a second-rate Blackpool would be infinitely worse. The places now under consideration, these jewels of nature's setting, perched on uplands, reposing in valleys, keeping guard on sea and moor, spell rest and recreation, inspiration and health to the nature lover and the beauty seeker. The tiny stream, plashing its way over Devon rocks or meandering through fern-clad vales, gives more pleasure to contemplative minds than the river laden with its pleasure craft packed to suffocation with a crowd of merry souls, and it often makes the attractiveness of a town and takes the place of a "chief industry" in providing the bread-and-butter of the townsfolk. And yet one selfish owner, one unthinking builder, may irretrievably ruin a natural picture because no step has been taken to protect the town's interests. The cutting down of a noble group of forest trees may change the aspect of a countryside; an obtrusive advertisement hoarding may make hideous the most perfect sylvan sweetness.

It is, therefore, well to remember that these things may be guarded at trifling cost by a properly conceived town-planning scheme. The initial cost of preparation is very little. It is much less than individual residents would be willing to pay as an insurance against these other things happening. And it has been found in practice that the sums to be paid as compensation to owners are very little indeed. With some tact, and by exercising the extensive powers provided for constant conference with all sections of the community as the plan proceeds, agreement can, in most cases, be arrived at as to what should be preserved in the best interests of the town, for landowners no less than others realise that the destruction of natural beauty depreciates the value of their own land.

The blessed word "amenity" may cover a good deal, and the "model clauses" recently issued from the town-planning department of the Ministry of Health will be found most helpful in dealing with this problem. It is recognised that to prohibit any cutting down of trees might be unfair to owners, so the authority is required to register any tree or group of trees whose preservation appears desirable, and it then becomes an offence to destroy such trees. In most towns where this question is urgent there is usually a body of public-spirited individuals who have had this matter under consideration and whose help will be very useful to the authority.

The regulation of hoardings for advertisements is combined with some decision as to the character of the advertisement, and this will be very valuable, wisely used. Another protective clause, which may prevent many an eyesore, is the power to secure that private gardens and open spaces shall be reasonably maintained in good order, and the man whose garden is an affront to the neighbourhood and produces only crops of weed seeds may find that the job of keeping things decent and tidy has been done for him, and that he has got the bill to pay.

ILLUSTRATIONS.

Design for a Repertory Theatre.

This design, by Mr. C. H. Hutton, was awarded first prize for the best set of working drawings made at the Liverpool University School of Architecture during the year in the competition inaugurated by Messrs. Holland & Hannen and Cubitts, Ltd. The set of twenty drawings was submitted for a thesis for the B.Arch. Degree with Honours in construction, and was awarded a First-Class in July this year.

Shepherd's Bush Pavilion.

Mr. Frank Verity, F.R.I.B.A., is the architect of this new cinema theatre, which was opened last week. It is claimed to be one of the largest theatres in Europe; the width across the parterre is 100 ft., and from the rear wall to the orchestra is 160 ft.; the height of the ceiling above the auditorium is nearly 75 ft. The ceiling consists of three sections, the section uniting with the proscenium being formed to represent a vaulted arch. Our illustration is from the exhibit at this year's Royal Academy Exhibition.

House near Watford.

The house now being built has been considerably altered from the original plan; in fact, it is a new plan. The present house consists of a living-room, hall, dining-room, kitchen, scullery, and offices, with four bedrooms, garage, and terrace. Messrs. J. Laing & Son, of Carlisle and London, are the contractors, and the fireplaces, ironmongery, &c., are being supplied by the K.C.B. Foundry Co., of Mount-street, Grosvenor-square.

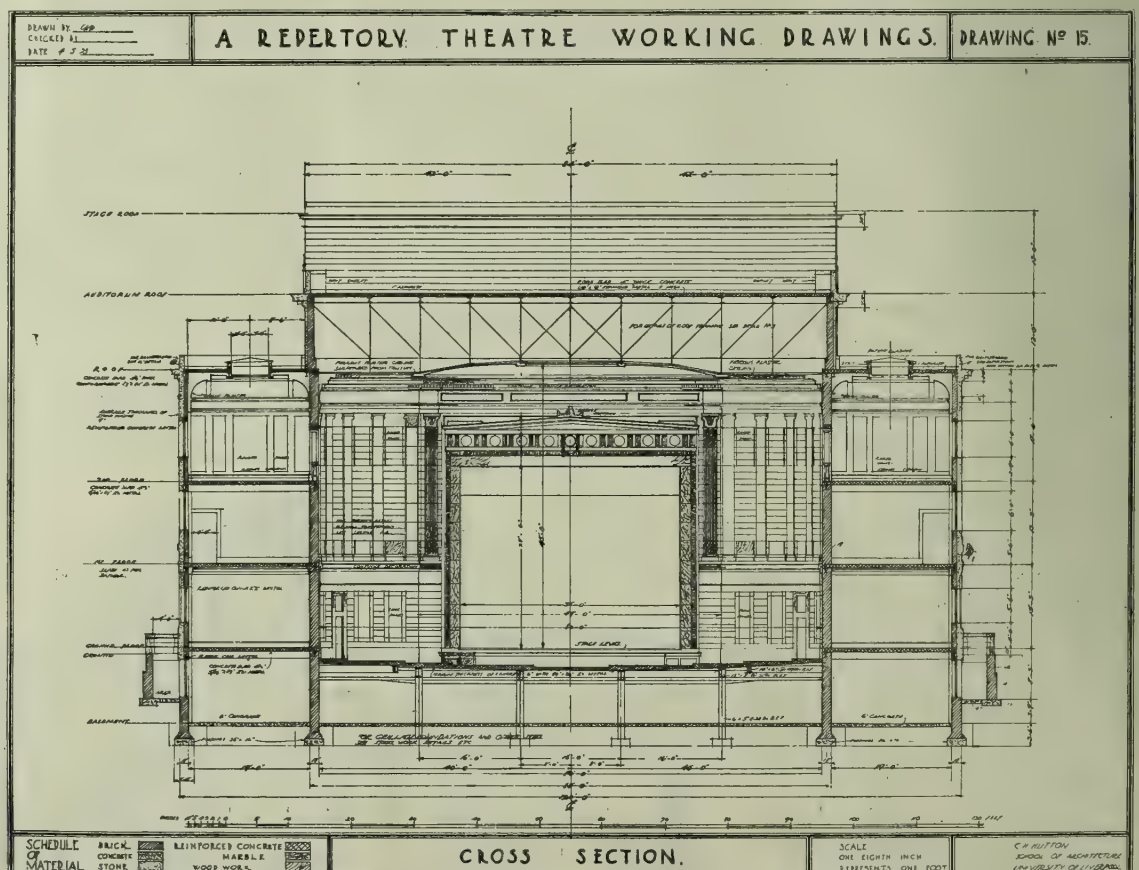
The architects are Messrs. Courtenay M. Crickmer, F.R.I.B.A., and Allen Foxley, M.A., of 1, Lincoln's Inn Fields, W.C. 2.

Cork Municipal Buildings and Town Hall Competition.

We illustrate the successful design in this competition by Messrs. Jones & Kelly, of 17, South Frederick-street, Dublin, who will carry out the work, which is to cost approximately £120,000. The second premium of £200 was awarded to Messrs. Donnell & Dixon, 20, Elyplace, Dublin, and the third premium of £100 to Messrs. Bryne & Son, of 20, Suffolk-street, Dublin. The competition was confined to Irish architects. Mr. Lucius O'Callaghan, F.R.I.A.I., A.R.H.A., was the assessor.

Exeter War Memorial.

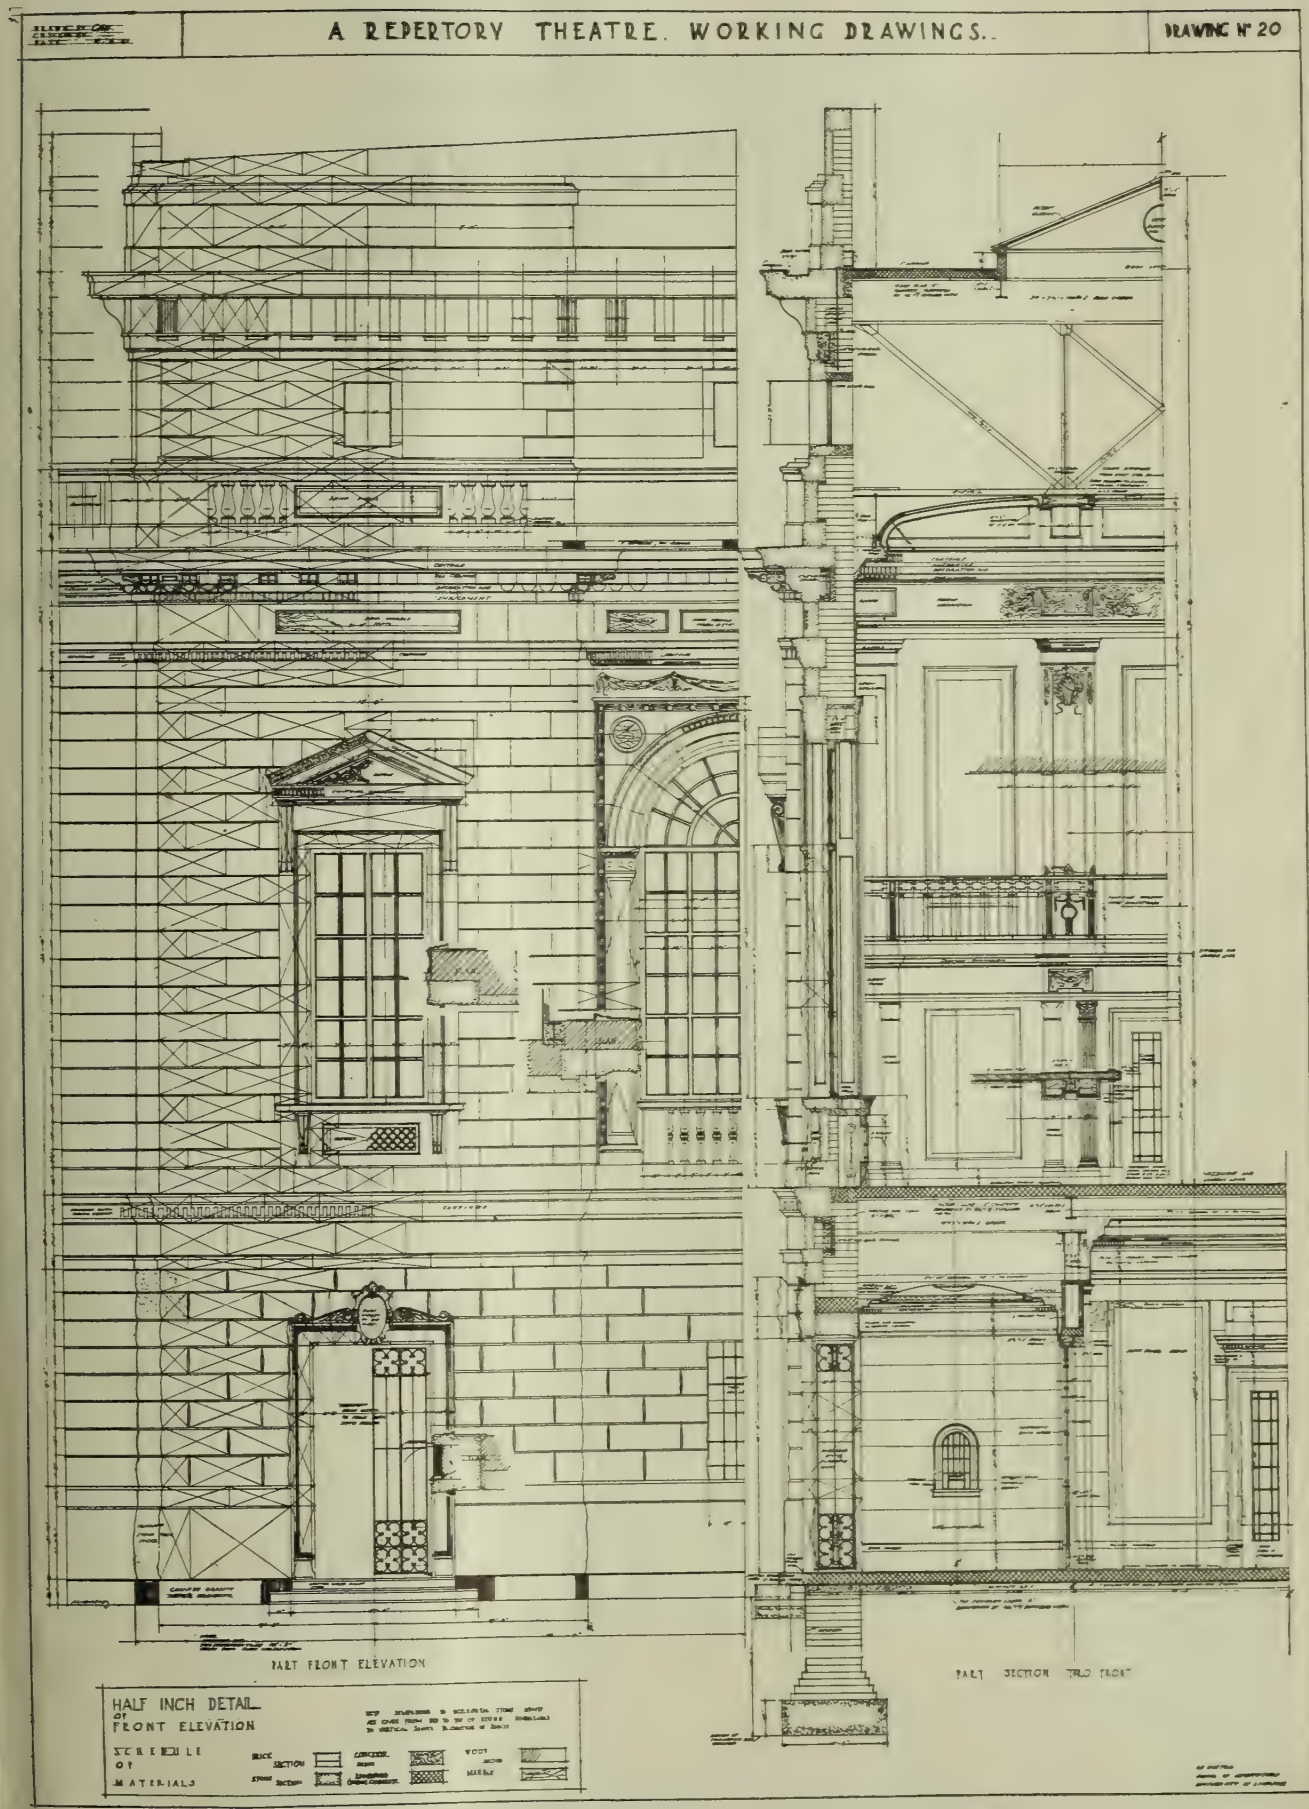
With reference to the illustration and description of Exeter war memorial, given in *The Builder* of August 3, the bronze figures at the base, representing the sailor, the soldier, the nurse, and the prisoner of war, were cast by Wm. Morris & Co. (Westminster), Ltd., at the Morris Art Bronze Foundry, Rochester-row, S.W.



EXHIBITION NOTES.

TWENTY-ONE GALLERY.

Excellent colour is a dominant feature of the small pictures at the Twenty-one Gallery Summer Exhibition, and this applies to varying methods of expression such as the prevailing notes of grey against the blue sky in Bernard Sickert's "The Gantry at the Toll Gate" (32), the mellow tone in "The Flowered Gown," by F. Ernest Jackson (31), or the brilliant colouring in "The Yellow Boat" and "The Pool," by Alfred Palmer. Though the subject is depressing enough the colour and light make a very telling result in Walter Sickert's "Interior" (38). The "Tetuan Street" (35), by Henry Bis op, is an admirable little picture in tone and colour. A delightful little flower painting is "Anemones," by R. Heriot. "On the Dart near Totnes," by H. A. Stevens, presents something of the reality of light effect over the river. The little picture, "Romance" (34), by W. E. Webster, with its setting of a graceful figure against a dusky background, takes us really a little way into the region of romance. "The County Bridge, Barnard Castle" (29), by Chas. Bathurst, gives a sympathetic picture of old English buildings and their surroundings. Altogether this small exhibition is good to see, and shows that notwithstanding so much crazy effort is at work in the picture world we still have artists who are capable and willing to please us.



HOLIDAY SKETCHES.

An exhibition of holiday sketches will be forthcoming this autumn, we hope, for nothing affords more pleasure than the spontaneous jottings of form and colour which appeal to us in a holiday mood. The essential and salient characteristics which are seized in this way have a significance and value so often lost in elaborate work. The sketcher is not always the best judge of what makes an appeal to others, but we are sure a discriminating searcher for subjects would find ample material for an exhibition of very great interest.

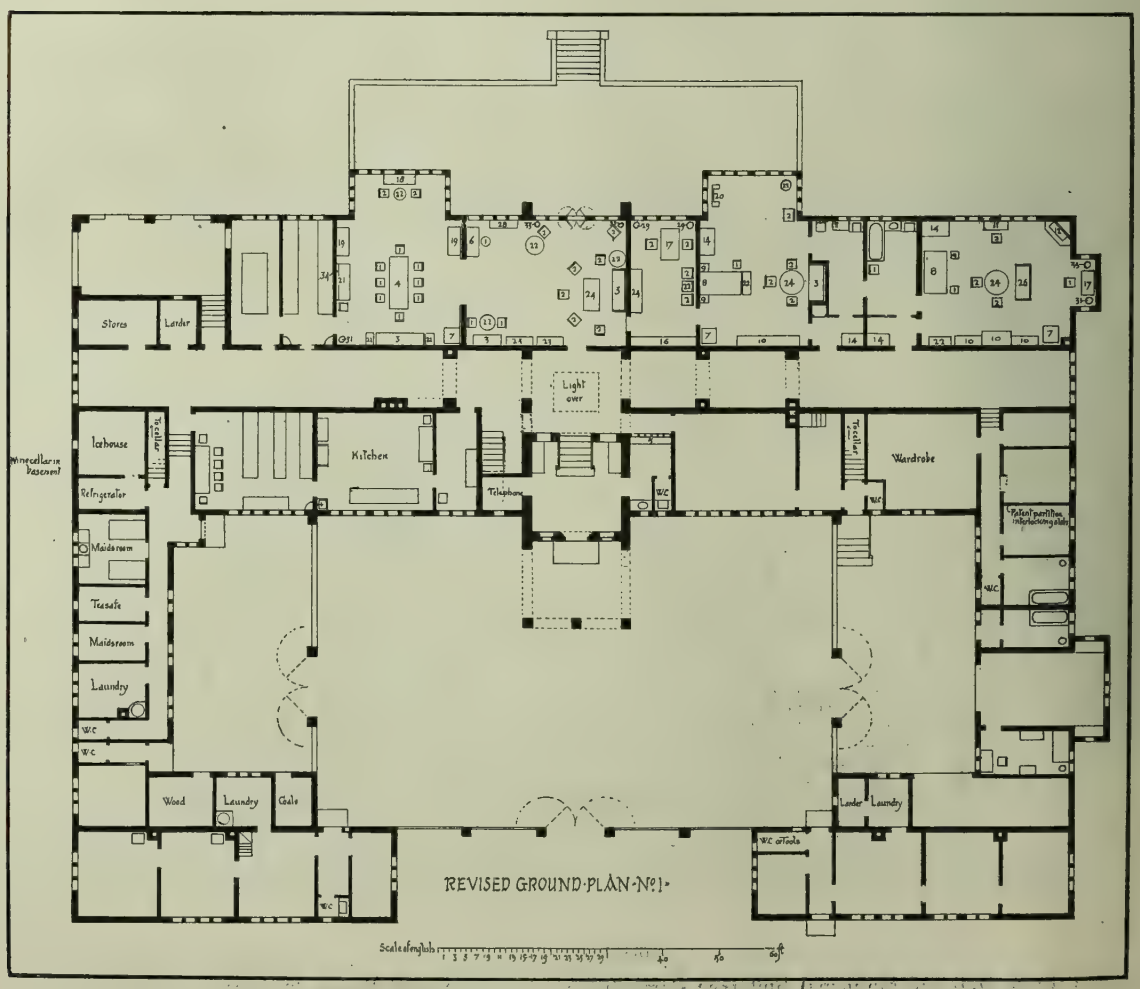
PROPOSED HOUSE AT HELENEUTHAL, IGLAU, CZECHO-SLOVAKIA.



This house is to be built in brick, cement roughcast, and roofed with oak shingles. All the joinery and furniture is to be in oak left free from stain or polish. Gun-metal double casements, both opening outwards, are provided. Halls, passages, loggia, and terrace are to be paved with dark grey stone slabs. All windows are local grey granite. The floors of rooms are solid concrete floated over with cement and carpeted all over up to walls with hand-made tuft carpet in plain colour free from all pattern. No blinds are to be allowed, but windows will be fitted with plain thin silk curtains. The walls where not panelled in oak are to be finished in hard rough plaster, distempered white. Staircase and landings panelled in oak, the stairs being left without carpet. All skirtings where walls are plastered to be in 6 in. by 3 in. green glazed tiles laid on edge flush with the plaster. The whole house is heated by hot water. Mr. C. F. A. Voysey, of 73, St. James's-street, S.W.1, is the architect.

MONUMENTS FOUND AT ST. PAUL'S, CLAPHAM.

Very few antiquaries who are interested in the past fortunes of the London suburbs are cognisant of the existence of a somewhat remarkable and almost unknown group of monumental effigies belonging to the church of St. Paul, Wandsworth-road, Clapham. The church itself stands on the site of the original parish church dedicated to St. Mary, which is believed to have existed as long ago as the twelfth century.

This old church was demolished in 1775, with the exception of the north aisle and a transept, which were left for the celebration of burial services. A view is given in the *Gentleman's Magazine* of December, 1815, pt. 1, p. 489, in which year it was completely destroyed, and on its site the present church of St. Paul arose as a chapel of ease, erected by Act of Parliament, cap. 86, May 21, 1813, Geo. III. Then it was that the entombment of these monuments, rightly called by the late Mr. J. W. Grover, F.S.A., an architect of no mean merit, an "act of vandalism," took place

They consisted of (1) a black marble tomb outside the church, on supports of black and white marble, to mark the spot of the interment of the bodies; (2) a marble monument inside the church, consisting of two recumbent effigies of Sir Richard Atkins and his lady, adorned with heraldic bearings on shields and descriptions on the base, and probably surrounded with iron railings; and (3) a monument of their three children against the east wall, stated to be "a very noble work, surmounted by an arch of white marble," standing on Corinthian columns of the same material, and furnished with an inscription commemorating the deceased: Henry, Annabella, and Rebecca.

Mr. Grover conjectured that when St. Mary's Church was entirely destroyed, in 1815, the remains of these fine examples of sepulchral statuary were thrown into the same grave as the bones of those to whose memory they had been erected. There they remained in the darkness of the vault for seventy years, until by his exertions they were rescued from oblivion and decay.

By consent of the authorities, Mr. Grover set on foot an investigation by excavating, in 1885, a wall, which proved to be the outside of a flight of steps leading to the actual vault, but externally there was no clue to direct the energies of the searcher. "On entering the vault," stated Mr. Grover, "the sight which met the eye by dim candlelight was truly astonishing, . . . compared . . . to a magician's cave and to the dream of fairyland. . . . At the entrance of the vault stood the statue of Sir Richard Atkins, Lord of the Manor of Clapham, Knight and Baronet, Sheriff of the County of Bucks in the days of the Commonwealth, in white marble," habited in a suit of seventeenth-century armour, adorned with a sash, wearing a peruke, and displaying, after a custom of his time, a short-clipped moustache somewhat resembling eyebrows. Behind this stood a charming figure of his child, Rebecca, nine years of age, "a perfect gem of art and in exquisite preservation," holding in her frail hands, after the morbid taste of the time, a skull. The slab underneath the figure records her death, in her ninth year, June 10, 1661.

Opposite the statue of the father sat the effigy of Henry, his eldest son, who died in the twenty-fourth year of his age, February 15, 1677. He was represented as clad in Roman costume, but also adorned with a wig. Mr. Grover calls this statue the *chef d'œuvre* of the group: the pose superb, the back of the right hand resting on the knee, and the limbs, which are bare, are most finished pieces of sculpture; one finger alone was wanting. Further on, the effigies of the two ladies were seen: Rebecca, the dame, recumbent, with handsome fine bold features, double chin, and wearing a veil; beside her the figure of the elder daughter, Annabella, who died in Paris on January 1, 1670, in the nineteenth year of her age. She wears a gown with ample sleeves, a light low bodice the hair short in front and curled, holding book in the left hand, and having a finge between the leaves.

The marble effigy of the dame, a heav block weighing nearly one ton, had bee "with cruel irreverence placed upon two c the leaden coffins, which were crushed flat by the superincumbent sculpture. The in scription relating to the baronet records tha he died on August 19, 1689; that his dam and relict was "heir of Sir Edmund Wrigh otherwise Bunckley, of Swakeley, co. Middle sex, Knt."; and that there were ten childre of the marriage. Sir Richard appears t have been grandson of Henry Atkins, phy sician to King James I, who purchased Clap ham Manor for six thousand pounds, derive from royal gifts bestowed on him for hi attendance on the royal infant Charles, whor he fortunately cured of a fever in Scotland.

Grover after some time rescued these fin specimens of seventeenth-century sculptur from the obscurity in which they had so lon languished, and had the satisfaction of seein them safely set in a convenient resting-place a mortuary kindly lent by the Burial Boar for the purpose, situate in the churchyard As works of art and as specimens of por traiture they deserve all praise; they are, too with few exceptions, in excellent preservation being made of the finest marble. Clapham is indeed, to be congratulated as having to show such an interesting record of that period. I was proposed to re-erect the group in th north transept of the church where they la concealed so long a time.

The expense connected with this matter wa undertaken by the Rev. F. W. Atkins Bowyer lord of the manor, late rector, and the repre sentative of the family. It is not known wh the artist was who designed and executed th work, but whoever it was it is worthy of high praise and admiration.

By the kindness of the Rev. S. Allnutt Vicar of St. Paul's, we are able to illustrate the foregoing remarks with a photograph showing the relics, which have now been safely erected in a suitable position in the church where they can be conveniently seen and become the subjects of that admiration which they well deserve.

Atkin's Monuments in St. Paul s Church, Clapham

THE NEW HOUSING ACT.

The Housing, &c., Act, 1923 (which is discussed in our leading article this week) has now been published.

The provisions in the Act for the assistance of new construction, and the proposals of the Minister for the administration of the scheme, may be summarised as follows :—

Assistance Provided under the Act.

The assistance provided for in section 1 of the Act takes the form of an annual contribution, which will be paid, subject to certain conditions, towards expenses incurred by the local authorities. The local authority's proposals may take the form of assistance to private enterprise, or of the provision of houses by the local authority itself. Where the local authority undertakes the erection of houses, or where the assistance granted to private enterprise is not less than the equivalent of £6 a year for 20 years, the Government contribution will be a fixed annual payment made to the local authority* of £6 a year for 20 years, in respect of each house completed within the prescribed period. Where, however, the total assistance in respect of a house built by private enterprise is less than the equivalent of £6 for 20 years, the Government contribution will be the equivalent of the total assistance actually granted, and will be paid to the local authority either in the form of an annual sum for 20 years or a sum of £6 a year for a period of less than 20 years.

Under the terms of the Act the houses must be completed, ready for occupation, before October 1, 1925. The Act provides, however, for an extension of the date to June 1, 1926, if the Minister is satisfied that the construction of the house or necessary work of development on or about the site preliminary thereto was begun within reasonable time, and the failure to complete the house before October 1 was due to circumstances over which the person constructing the house had no control.

As regards houses provided by private enterprise the Minister is required before giving his approval to proposals made to him by local authorities to satisfy himself that the need cannot be met without assistance, It will be for the local authority in the first instance to satisfy itself that the houses proposed to be built would not be provided unless financial assistance were forthcoming, and to determine what the minimum assistance is which will induce private enterprise to build.

The annual sum of £6 for 20 years is the Exchequer contribution towards the expenses incurred by local authorities where the total assistance given is the equivalent of £6 for 20 years or more. The local authority is empowered to give more or less than this according to the requirements of the locality, and it is for the local authority to determine in the first instance what minimum sum is required, whether more or less than the equivalent of £6 for 20 years, to induce private enterprise to proceed.

The lump sum equivalent of £6 for 20 years depends on the terms on which the authority may borrow.

In the case of houses provided by private enterprise, it will not be open to the local authority to give assistance except in respect of houses the construction of which is begun after the proposals of the local authority have been approved by the Minister.

Under the terms of Section 2 of the Act assistance by the local authority to private enterprise may take one of three forms, viz. :—

(*a*) a lump sum grant per house ;

(*b*) an annual payment for a period of not more than twenty years to the person by whom the rates are payable.

No payments under Section 2 may be made by a local authority for the assistance of private enterprise until after the completion of the house in respect of which the payments will be due.

Section 2 (4) of the Act enables a local authority to attach conditions to the payment of grant in respect of a house built by private enterprise. One of these conditions, the object of which is to prevent abuse of the subsidy, may be that during a specified period from the payment of the grant the house shall not be used otherwise than as a separate dwelling-house, and that no addition or enlargement shall be made without the consent of the local authority.

Section 2 provides that in the County of London the London County Council shall be the authority empowered to assist private enterprise to the exclusion of any other local authority.

Description of Houses which will qualify for Assistance.

A.—Type.

The houses may be—

(*a*) Two-story cottages† ; or

(*b*) One-story cottages, or bungalows ; or

(*c*) Houses built in flats, each flat being treated as one house.

B.—Area and Measurement.

Assistance will be available under the terms of the Act [Section 1 (2)] for houses having a superficial area within the following limits :—

For a two-story cottage—Minimum 620 super. ft. ; maximum 950 super. ft.

For a one-story cottage or bungalow, or for a flat—Minimum 550 super. ft. ; maximum 880 super. ft.

The Minister is, however, empowered to permit smaller houses to rank for subsidy where a local authority satisfies him that, having regard to special circumstances existing in their area, there is a need for houses of smaller dimensions. The minimum sizes which can be permitted in such cases will be 570 super. ft. for two-storied houses and 500 super. ft. for flats or one-storied houses. In every case permission will be given for such limited number of houses for the particular area, subject to such conditions as the Minister may determine.

Under the provisions of the Act no assistance can be granted in respect of any house whose area does not fall definitely within the above limits.

The rules for the measurement of superficial area will be as follows :—

(*a*) The area will be measured within the external or containing walls of the house (so as to include the area of chimney breasts, bay windows and similar space), and, in the case of two-story cottages, will be the combined areas, as so measured, of the two stories.

(*b*) In the case of houses built in flats the space occupied by a staircase will not be included in measuring the area of a flat.

(*c*) Habitable accommodation provided in an attic or story formed in the roof will be included without regard to the use to which it may be intended to be put. In determining whether accommodation is habitable regard should be had not only to its condition as shown in the plans, but also to the possibility of its conversion into habitable accommodation. The area of so much of the attic as is less than 5 ft. in height will be excluded in measuring the habitable accommodation.

(*d*) Cellars will not be included.

(*e*) Outbuildings will be excluded if they are not an essential part of the house, but will be included if they provide accommodation which is necessary to the occupation of the house or is usually included within the containing walls of the house. Outbuildings are buildings not communicating with the house which are outside the containing walls of the house, whether attached thereto or not. Examples of an outbuilding to be included are a w.c., coal-house or scullery. A tool shed, wood shed or bicycle shed would not be included. The area of an outbuilding to be included will be measured within the containing walls of that area.

(*f*) Covered area, such as the area of a verandah or porch, which is attached to but outside the containing walls of the house, will not be included as part of the area of the house.

Planning and Construction.

The Minister does not propose to prescribe a maximum density, and he considers that a discretion may properly be exercised in this matter by the local authority in view of the particular circumstances of its district. He is of opinion, however, that a density of approximately twelve houses per acre represents a desirable standard and that, as a general rule, a local authority should not approve the building of more than twenty houses on any one acre.

The houses must be of a type of construction for which a period of not less than 60 years would be allowed by the Ministry of Health for the repayment of a loan. The materials must be of good quality.

Under Section 24 of the Housing, Town-Planning, &c., Act, 1919, where a housing scheme has been carried out in accordance with plans and specifications approved by the Minister, the local by-laws do not apply to such scheme in so far as they are inconsistent with the plans, &c. Similar departures from the by-laws will be permissible in the case of houses which will be eligible for subsidy under the Act. In other respects the local by-laws must be complied with unless a consent is given by the authority under Section 25 of the Act of 1919.

Sections 12 and 13 of the Act provide for the revocation of existing by-laws and the making of new by-laws where in consequence of the existing by-laws the erection of buildings is or is likely to be unreasonably impeded.

The local authority may exercise discretion as to the sizes of rooms to be permitted having regard to the circumstances and the character of the plan, but the Minister points out that rooms of the folllowing sizes which have been regarded as affording a desirable standard can be obtained within the limits permitted :—Living room, about 180 sq. ft. ; first bedroom, about 150 sq. ft. ; second bedroom, about 100 sq. ft. ; third bedroom not less than 65 sq. ft. Where a parlour is also provided some reduction in the size of the living room may reasonably be permitted.

Section 1 (2) of the Act provides that, except where otherwise approved by the Minister on the recommendation of the local authority, every house or flat to be eligible for subsidy must be provided with a fixed bath.

Houses Which are Not Eligible.

Contributions will not be payable in respect of the conversion of an Army hut or similar building, or in respect of any house—(*a*) which is constructed by the conversion, adaptation, or extension of an existing building, or includes any part of an existing building other than the party wall of a habitable dwelling house ; (*b*) which contains or is constructed for occupation with an office, shop, business premises, garage, stable or similar building ; or (*c*) which is built to replace loss by fire.

Loans to Builders.

Section 5 of the Act gives new powers to the local authority for the advance of loans to builders and others for the construction of houses of which the estimated value does not exceed £1,500. Under these powers the local authority will be enabled to assist by way of loans persons desiring to build houses for their own occupation or to build one or more houses for sale or letting. It will also be open to a local authority under this power to lend money to public utility societies or other societies or bodies undertaking to build houses.

The loans will be secured by mortgage. The amount of the advance may not exceed 90 per cent. of the value of the interest of the mortgager in the property, but will otherwise be within the discretion of the local authority, subject to the approval of the Minister.

During construction the local authority is empowered to make advances up to 50 per cent. of the value of the work done, including the value of the builder's interest in the site. Loans

* Where houses eligible for subsidy are erected by a Metropolitan Borough Council under an approved scheme, the London County Council is empowered to supplement the contribution made by the Minister to the extent not exceeding £3 a year for a period not exceeding 20 years.

† An attic would be permitted in addition, subject to limits of area.

to persons having a leasehold interest will be permissible, but in such cases the unexpired period of the lease at the date of the advance of the loan must be at least 10 years in excess of the period fixed for the repayment of the loan.

Advances may only be made after a valuation duly made on behalf of the local authority. The rate of interest to be charged will be within the discretion of the local authority subject to the approval of the Minister. It is suggested that loans should ordinarily be repayable in 20 years, and be transferable to the purchaser of a house as required. Repayments may be made by monthly instalments. These powers are temporary and will be exercisable at any time up to October 1, 1926.

Provision is made in Section 22 for the amendment of the Small Dwellings Acquisition Acts so as to enable loans to be made within much wider limits to persons who desire to purchase a house for their own occupation. Advances may be made during construction up to 50 per cent. of the value of the work done, including the value of the interest of the borrower in the site. The Acts are made available for houses up to £1,200 market value, and the percentage which may be advanced will be within the discretion of the local authority subject to a maximum of 90 per cent. of value. The requirement that the purchaser shall be required to reside in the house will have effect for a period of three years only from the date when the advance is made or from the date on which the house is completed, whichever is the later, and it will be within the discretion of the local authority to dispense with this condition at any time.

In addition to the subsidies payable through building societies, the local authority will have power under Section 5 (1) (*b*), at any time up to October 1, 1926, to guarantee the repayment to a building society of an advance made to any of its members desiring to build or acquire a house having an estimated value of not more than £1,500. The object of both these provisions is to enable a building society to advance a larger proportion of the cost of a house than its rules would normally allow.

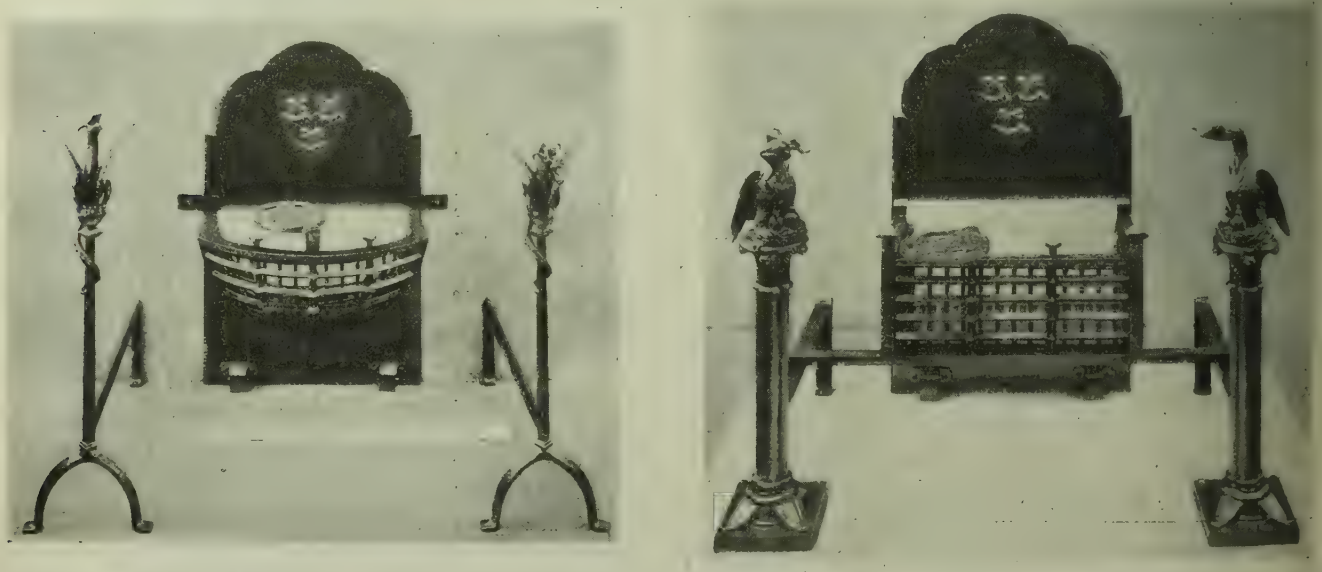
CONVERSION OF HOUSES INTO TENEMENTS.

In order to facilitate the conversion of houses into separate tenements (Section 5 (1) (*c*), it is provided that the local authority shall have power to refund during a specified period, not exceeding twenty years, the whole or part of the excess rates on each tenement over and above the rates which would have been payable if the tenement had been rated proportionately with the other tenements in the house on the basis of the rateable value before conversion. There is no restriction on the value of the house.

BOOK REVIEW.

The Records of St. Bartholomew's Priory and of the Church and Parish of St. Bartholomew the Great, West Smithfield. By E. A. WEBB, F.S.A. Vols. I and II. (London: Oxford University Press. Price 84s.)

The Priory Church of St. Bartholomew the Great, West Smithfield, is one of London's most precious architectural survivals, not only in respect to its age and historical interest, but in virtue of the intrinsic beauty of its massing and detail. The vaulted aisles and stout round pillars are subjects well known to artists, and date from a period before the line had been substituted for the surface as the chief element of architectural composition. The feeling for modelled form is strongly in evidence in the contrast of plain archivault with rounded shaft, and also in the intensely rational shape of scalloped capitals artistically marking their division while performing a structural function. These details which remain to us from the original building of the first Prior and founder, Rahere, belong in style not so much to Romanesque as to the elemental architecture of common sense all too seldom seen, but when seen certain to charm.



One of the many pleasant things to be found in Mr. E. A. Webb's monumental work, "The Records of St. Bartholomew's, Smithfield," is the assurance that the character of the founder was as delightful as the architecture that resulted from his pious exertions. As the ancient chronicler quoted by the author has placed on record, Rahere was capable of being all things to all men and could manage to enlist the sympathy of children and servants as well as of King Henry I and the Bishops: "When, however, Rahere had devoted his energies to the purging of the place and had decided to put his hand to the sacred building, not being ignorant of the wiles of Satan, he made himself a fool because he was constrained to do so (*quia coactus*) and outwardly putting on the appearance of a simpleton he began for a time to hide the secret of his soul and do his work more wisely the more he did it secretly. At length, with wonderful skill in games, he won to himself bands of children and servants, and by their help he easily began to collect stones and other things which should be profitable for his building. And he himself played with them and became in his own eyes even more vile from day to day, in order only that he might so much please the apostle of Christ, to whom he approved himself. And helped by his grace, when those things that seemed necessary had been prepared, he raised up an immense fabric, and now he began to openly to be and to be called not foolish as was being thought, but truly wise as was being concealed."

From King Henry I, whose merry courtier he had been in unregenerate days, Rahere obtained a most comprehensive charter, dated 1133, granting exceptional privileges to the intended house of Augustinian Canons, some of which exemptions from liability to civic duties were pleaded by the Protestant parishioners of St. Bartholomew's long after the monastery had suffered suppression.

From the author's text and from the many original documents quoted by him, a great deal may be learned about the internal economy of monastic establishments which will be of interest to all readers who desire to investigate the connection between the appearance and the purpose of works of architecture. The information is particularly appropriate at the present time, when a party in the Church of England is endeavouring to revive community life in the belief that it can still be of service as it was in the period succeeding the Norman Conquest.

In the first introductory chapter the general utility of such an establishment of Prior and Canons is outlined under the headings of "Service to the Realm," "Service to the Church," and "Service to the See of Rome"; the first-named service included the collection and payment of large sums of money to the King to enable him to carry on wars at home or abroad. The service to the people is difficult to appraise at its true worth in our altered state of existence here in England, but the duty of dispensing hospitality to travellers is still recognised in the religious houses of Palestine, for example, and is warmly appreciated both by pilgrims and tourists, who would otherwise feel the hardship of doing without suitable food and shelter. In the case of St. Bartholomew's the famous

Bronze Dogs for Fireplaces at Cardiff Castle. Designed by MR. H. SESOM-HILEY, late Architect to the Castle, in conjunction with the Carron Company. (*See p.* 293.)

pital formed part of the original foundation; hat the care of the sick poor was proposed n the beginning side by side with the estab- ment of a religious routine. The hospital, fact, formed the subject of Rahere's first oition as a reformed character, the Priory its church resulting from a dream revealed im on his return journey from Rome, where had been on pilgrimage.

he first volume of Mr. Webb's admirable k carries the history of the Priory to the date he second suppression in 1559, and deals with literary evidences other than the structure he Church buildings. Many documents are ted in full and lists of accounts and posses- s of the Priory form a great part of the book. he second volume treats of the structure and estoration, and is illustrated with numerous s and measured drawings made by members ir Aston Webb's staff as well as by historical wings of earlier date.

he general purpose of the work is well ressed in Mr. Webb's preface: "I offer these mes to all lovers of St. Bartholomew's (and they are many) as an honest endeavour to put into one book all that is known about it. As the majority of my readers will not be antiquaries, and may not have more knowledge of such matters than I had when I commenced my researches, I have ventured to give such explanations of antiquarian, historical, and legal matters as I myself had to acquire before I could fully understand the records before me." The result of this comprehensive method of attack is an admirable work of reference upon a delightful subject.

BRONZE DOGS AT CARDIFF CASTLE.

We illustrate on p. 292 some bronze dogs at Cardiff Castle. The larger dogs for the day nursery are in the form of the Welsh Dragon encircling the andirons of armour-bright metal, surmounted with a copper ball; one is telling a story and the other laughing at it. The smaller dragons, for the boys' night nursery, are climbing the shaft of the andirons, to attain the zenith of their power, suggestive of Celtic ardour, humour and assertiveness.

For the girls' night nursery are the stork and its young, on clustered columns of armour-bright metal, emblems of maternity, harbinger of spring, &c. The basket grates and trivet with the dragon and shamrock interwoven, of armour-bright metal, are on castors, with the back plate bearing the arms (Bellingham) of the Marchioness of Bute. The dogs were modelled and cast by the Carron Co., Stirling, from the joint designs of their artist and Mr. H. Sesom-Hiley, late Architect to Cardiff Castle.

Barclays' Bank, Pall Mall East, S.W. Mr. Arthur Blomfield, M.A., F.R.I.B.A., Architect.

building, which is erected on a site leased from the Crown, and some 12,000 sq. ft., is of Portland stone, roofed with Westmorland slates. The major part of the ground floor and basement is occupied by Messrs. Barclays Bank, the upper floors being let to tenants as offices. The contractors for the work were Messrs. Trollope & Colls.]

THE YORK SCHOOL OF GLASS PAINTING.

In the course of a lecture delivered at the annual meeting of the British Archæological Society recently, Mr. John A. Knowles gave a general review of the York school of glass painting as a craft.

Glass painting, he said, had been practised at York from a very early period, and in the Minster was the earliest panel of painted glass in England. The subject was Christ in Glory from a Jesse Tree, and it was so extraordinarily like similar panels at St. Denys and Chartres that it was impossible to believe otherwise than that all three were derived from a common source, but whether English or Continental it was difficult to say. There was, at any rate, sufficient evidence to show that the connection between French and English work in glass at that time was close, and at any rate the York panel was, as the late N. H. J. Westlake pointed out, "The earliest piece of painted glass in England. Unfortunately, it is placed too far beyond the reach of the ordinary student for examination and it would be an advantage, for the purposes of study, if a more convenient, and yet secure, position could be found for it." Although that advice was given over forty years ago, the panel still remained in one of the most exposed positions in the north clerestory of the nave.

The two principal centres of mediæval glass-painting were London and York. Roughly speaking, London painted most of the windows for the south and York for the north. But though London and York designed and painted windows, they did not make glass, and practically all the coloured glass and most of the white had to be imported from the Continent. The lead, too, would be similarly transported by water. In fact, it was not too much to say that York would never have been a centre for glass painting were it not for the fact that it was situated on a river.

A few years ago, and even to a large extent at the present day, the opinion was very generally held that attached to cathedrals there was a stained glass department where windows were designed and painted. As far as the great east window at York was concerned that was absolutely true, that work being designed and painted in the Dean and Chapter's own shop with glass and lead bought and labour specially hired for the purpose. But apart from the great east window, there was no evidence that any of the others were done under that system.

One was liable to get an entirely erroneous notion from the account rolls of the men who were set down as receiving wages for working at the Minster. One read, for example, of "John Petty, glazier, working in the fabric for 77 days and being paid 43s. 6d. wages, and Thomas Drawswerd, being paid 32s. 11d. for painting the canopy carried over the feretory of St. William; with gold and colours." From these items we might conclude that Petty and Drawswerd were humble individuals, but in point of fact both of them were as important personages as the Dean himself. Sir John Petty, as he was afterwards known, was a very great man indeed. Eleven years before, he was Chamberlain of the city and he afterwards became Lord Mayor. Even in the Minster itself one of the panels of the St. William window depicted the Lord Mayor of York seated in a place of honour at Archbishop William's enthronization feast with his hat (the cap of maintenance) on, whilst everyone else was uncovered, a thing no other dignitary would have dared to do. Thomas Drawswerd was no less a personage. He was in a large way of business as a church furnisher, and was believed to have carved the screen at Newark in 1
He was M.P. for the city and twice Lord Ma

The work of the York School was dist
from that of others in material, design,
choice of subject, and local fashions in cost
and armour were frequent. A favourite
of subjects in York glass showed sanct
persons who were united in holy wedl
surrounded by their children. These
probably intended as a sly dig at the celil
of the religious orders. Across the botto
one of the windows of the nave were represe
a hunting scene; a fox running off with
goose whilst the wife threw the distaff aft
and the husband saddled the horse to
chase; and the funeral of a monkey. In Y
work members of noble families were freque
shown wearing on their heads chaplet
feathers or leaves, as in the St. William win
and in St. Denys Church. The frequenc
this feature in the east window of Great Mal
Priory was one of the reasons for believing
that window also was York work. Apart
stained glass only one other example, as fa
the lecturer knew, of those chaplets being
was known, that being on a brass, also in Y
shire, of Sir Thomas de St. Quentin, c. 142
Harpham. In armour also local variat
occurred.

York artists seemed to have obtained n
of their inspiration and many ideas of t
ment from where they obtained the glass,
the Rhenish provinces. A favourite schem
a window was to represent the patron saint
various guilds. The three most popular g
in York were those of Corpus Christi,
Christopher, and St. George. The Co
Christi procession and the pageants on
following day were one of the big events of
year in York life. Another popular holiday
that in honour of St. Christopher and St. Ge
and that explained why one frequently
in York windows figures of St. Christo
and St. George on either hand. In Holy Tri
Goodramgate, were these two with a Co
Christi subject in the middle.

Suns were very common in York glass,

"HUNTING"

Stained Glass in North Aisle, York Minster. From drawings by Mr. J. W. Knowles.

A Religious Guild: St. Michael-le-Belfry Church, York. (The King's College Chapel, Cambridge, glass was executed in the same year.)

xford-Winchester work, seemed to be derived om German art. That treatment of drapery as to be seen in the brasses imported from the ontinent, probably from Lubeck, in King's ynn and elsewhere, and the narrow strip across e bottom, containing a hunting scene or hat not, might well have provided a model r the hunting scene and monkey's funeral in e window in the nave at York.

A criticism which could justly be levelled gainst the work of the York school, in archi-cture, carving and glass, was that there was ery little religious feeling about it. There was ot a carving of a religious subject anywhere out the Minster, if one excepted the bosses the nave roof where the carver was more terested in finding a subject which would the junction of the ribs of the roof than in cording the events of Holy Writ; but a fox the pulpit or a man shoeing a goose was mething he evidently relished doing; whilst atues of kings replaced figures of saints on e screen. If one excepted the great east ndow, there were in the chapter-house—secular building and unconsecrated—more enes from the life of our Lord and the Acts the Apostles than were to be found from e whole of the Bible in the rest of the Minster. e St. William window was nothing but a gantic hoarding to advertise the merits of e local saint and to attract some of the stream pilgrims passing through York on their way the far more famous shrines of St. Cuthbert Durham and St. John of Beverley, and the Cuthbert window was erected to advance political claims of the Lancastrian party a city which was strongly Yorkist in politics. n putting an approximate date on York k it was always wise to suggest a date ten wenty years later than one would ordinarily mate from the style and treatment. Thus west window at Altenberg, which, it was eved, inspired much of the Oxford-Winchester York work, was far in advance of any-g at York. Thomas of Oxford's canopy k in the remains of his Winchester College dow was more graceful and refined than n Thornton's in the great east window at k, which had many traces of Decorated tment about it, though it was fifteen years r in date. To put it bluntly, York was ind the times. An interesting sidelight in connection was shown by the fact that 292, when the monks of Beverley wanted ew shrine for the relics of their saint, and 377, when Durham Abbey wanted to place milar order for a shrine for St. Cuthbert, and also for the Neville screen, neither of them ordered the work in York, but in London, though they would have to pass through the city in order to do it, and also pay extra carriage, and that at a time when the York School was almost at the height of its power.

In common with all other schools of glass painting, York men practised extreme economy in the making of new drawings. Even in the St. William window, which was undoubtedly one of the greatest masterpieces ever done anywhere in glass painting, the number of times in which figures, groups or whole subjects had been used over again was surprising. Thus panel 68 represented a mother who had brought her sick child and propped him up against the shrine of the saint whilst she prayed for his recovery. A spectator pointed with forefinger at the child. By eliminating the figure of the child and painting spots all over the woman's face and hands, the same drawing had been made to represent a leprous woman recovered at the shrine, and the spectator in the background then pointed at nothing at all. Similarly, by eliminating the figure of a spectator, the drawing of a hump-backed boy cured at the shrine had been used for another panel representing the recovery of a drowned child. Drawings of single figures, such as bishops and saints, were, after being variously coloured so as to disguise the fact that they were all alike, used many times. Thus St. Thomas of Canterbury in the Parker window became St. Chad in the Wolveden window next to it, and someone else at Bolton Percy Church; St. William of York, in the Parker window, became St. Nicholas in the Wolveden, and an Archbishop at Bolton Percy, and so on. So far as could be judged from the floor, the eight westernmost clerestory windows of the choir were practically identical, and he thought it would be found that, with one or two changes, those consisted not of eight distinct figure designs, but of one design repeated eight times.

Although the glass painters of mediæval times did not sign their works, he thought, provided large-scale photographs were available for study, the authorship of many of them could be determined with some degree of certainty, for there was no school of glass painting elsewhere where so much was known about the artists themselves. In later times, the glass painters had a method of signing their works which was little known, and this was by impressing their names on the lead. This was done by having the wheels of the lead-vice, which squeezed the square bar of lead into a section resembling the letter "H," instead of being toothed or milled in order to grip the lead engraved with the name of the glass painter.

York glass painters were at an early date incorporated into a craft guild, not so much perhaps because they would as because they must. Two sets of ordinances had been preserved, both of which made it perfectly plain that repressive regulations were drawn up by the city. So far from the mediæval craftsman taking such a pride in his job that he put his best work where no one would see it, the reverse was the case. There was as much scamping as there was to-day, and probably more; and that glass painters were no exception to the rule was shown by the minute stipulations in contracts that the paint should be fired on in the kiln and not merely mixed with oil.

ENCOURAGEMENT OF THE CRAFTSMAN

By REGINALD HALLWARD.

A thoughtful letter, contributed to *The Times* recently, called attention to the difference between the merely antique craze of to-day and the work of fine contemporary craftsmen. As the writer says, "at present we are suffering under the erroneous idea that anything which is new is not the æsthetic equal of that which is old." Such a view reacts disastrously on the modern craftsman and its falsity needs exposing.

It has been pointed out before in *The Builder* how the traffic in antiques and "old masters" is anything but evidence of the country's care for art, and is rather to be regarded as the joint product of snobbery and commercialism. I am therefore glad to see attention called to the claims of the living craftsman, whose disabilities are very great; so well known, in fact, that they need no emphasising here. A disinterested love of his work has not seldom left him struggling amid the competition of more commercial tendencies, and he is unable to compete with them. As is said in an article in a contemporary, "a plea for living craftsmen is therefore a plea for much more than a revival of particular trades, and any purchaser who bans imitation and gives an opportunity for creative workmanship does service to the community far beyond the limits of his own purchase."

All this is well said, and the point to which I wish to give special emphasis is the first-hand approach of the craftsman; that we should go to him direct, shunning the spoon-fed directions for our taste, the thousand organisations, commissions, and other bodies by which that direct contact is obstructed. Away from this one fundamental need of going to the craftsman direct, may we not feel doubtful of the usefulness of the vast organisation which now encircles the arts, so far removed from this first essential requirement?

As we begin to understand more about art and the mystery of its unfolding, we are becoming more uncertain of the doctrine that art can be encouraged, or high standards of craftsmanship and design secured, by multiplying bureaucratic organisations. There is a more direct way than all this, and one, strange to say, which has never yet been properly tried. It is the way advocated in the letter to which I have referred. If we want fine craftsmanship, let us seek the fountain head. If we want to encourage art, go direct to the craftsman—to the doer of it—and, in seeking him out, we must distinguish the real from the counterfeit, the lover of his work from the trafficker in it. No committees, associations or commissions can secure the prospects of fine craftsmanship in any way to equal this direct approach. Yet it is in danger of being disregarded just because it is so simple.

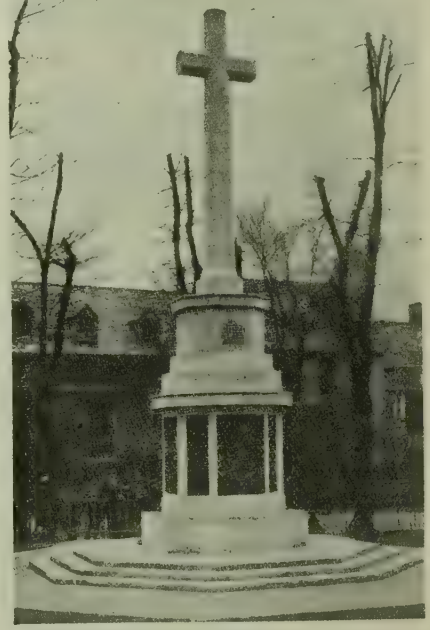
Excess of organisation is not favourable to art. Its excess at the present day is symptomatic rather of a stage in the birth of democracy, at present little able to realise its own needs, which lie so much in an enlarged self-respect, not content to delegate its responsibilities to others or to the dead momentum of bureaucratic organisation; which, applied to art, promotes its sterility, because it enforces a dependence and servitude to officialdom fatal to its own freedom and expansion. What, then, is the alternative?

It is to have more faith in ourselves; that art belongs to all and that we need to believe more in life, to be more truly democratic, if its beauty is to enclose our lives. It is not sufficient that the public should feel this direct and undelegated responsibility, it is even more urgent for the craftsman to extricate himself from the superstitions which lead him to subject his freedom to the yoke of this control. It behoves each one of us who believes this in no way to yield or give adherence and support to organisations which mistake the greater for the less, or to let the herd instinct usurp the nobler one of vocation and freedom. In no other way can the gates that lead to the heavenly courts of beauty be kept open.

Let the artist pray at all costs towards Jerusalem in the face of all societies which would reform his ways. Let him who would be really distinguished at this day keep himself from such—and I am glad to see the organisation of small bodies of craftsmen, guilds, and such like, making no claim but their work and going about it in quiet independent ways. A short while back an artist friend sought counsel of me as to whether he should join a certain art society. The question revealed the doubts in his mind even without my previous knowledge of them. And yet, in one way, it seemed so natural to respond to such a proposal as had been made to him. In consulting me, he was conscious of doubts which I felt as to the service to art of much of present organisation.

Did it strengthen the artist, or only a certain kind more able than the rest to make use of its machinery? Was the artist wiser in trusting to himself, to his own work, to the future, than to such recognition which also involved acquiescence in much that he doubted? I could but answer that my own experience led me to think that the advantage lay in trusting his work and his time, and that his independence brought more recognition and prestige with it than the diplomas of societies. For the artist will never know his own strength until he rests on himself and the herding instinct yields to the nobler one of feeling his life inspired, and trusting the future. I heard only recently of an artist who, so I was told, in proof of his getting on, was on speaking terms with nearly every Academician. It sounded so dreary. The cost seemed so tremendous.

But to return to the letter in *The Times*, which led me to the consideration of the salutary benefits in a direct approach of the craftsman, I was much impressed by the writer's statement in speaking of the ancient craftsmanship—"Their works can only have been due to their belief in the spirit to produce them. If t belief is there, the thing will be produced."



Such a statement grants little to machine and all the cunning with which we have s snares for art over the last sixty years or s Is it really, then, all so much more simp and paramount organisation merely superfluou I am concerned here with the future, not disregard what to many has seemed for t benefit of art in recent times. The co pass is turning now in other directions, a the artist is revealed against the residue organisation in sharper definition apart fro it all than when entangled in it. He is strong in standing alone.

This return to a self-respect which leav more to faith and the belief in life will le more than Academies to the restoration of a If the craftsman of art can now accumulate whole alphabet of letters after his name a depends so much on their aid, what is it b that he feels so little in himself and suffe poverty without such embellishments? This not the democracy of art, but its grief and undoing. So meanly endowed do we fe without these supports that we yield to the as a means of impressing others, feeling so litt in ourselves. In such dependence, such serv tude, the finest adventures in art will nev mature.

It is for this reason that the direct approa of the craftsman is so important. It is bett for the public to go to the craftsman direct a independently than to yield to the thousa advisers who would direct him, and he is in greater danger of making mistakes than if called in all the directors of all the public galleri of the nation to advise him; not because despise their office, but because the caution a timidity of committees and the fashion of t time so often directing them are a less sure gui than the unassuming intelligence of the avera citizen.

We shall make mistakes, but it is better make them in a right and manly way than in t "safe" and dependent way of a cowardly cautio How shall I soften the edge of this stateme better than by saying that what I am advocati is more in touch with the sources of strength the mediæval world than in any revolt authority? Discipline and authority are inhere in all freedom, but it depends on whence it derived.

The discipline I endorse is not one born out weakness, but out of strength. What is it b that belief which inspires us above the dominan of circumstances, the control of machinery The mediæval craftsman enjoyed more of t freedom because in the end he felt his relatio ship to be divinely guided, and found strength not in "being on speaking terms wi all the Academicians," but because his hea was pure.

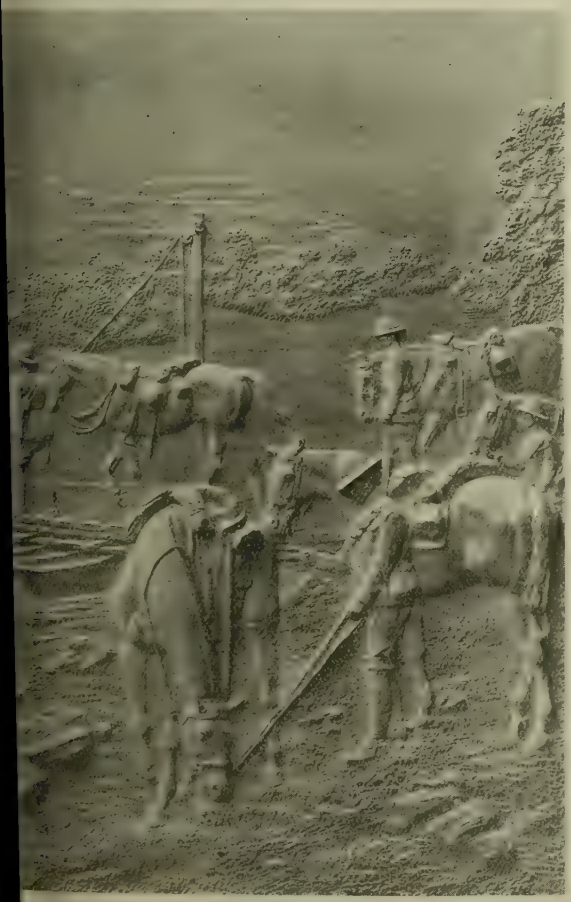
Bristol-Birmingham Waterways Scheme.

A scheme costing £3,750,000 for improvi the waterways between Birmingham a Bristol was considered at a meeting in Birmi ham last week of the National Council Inland Waterways. It was decided that Birmingham and Worcester section offe immediate practical possibilities for devel ments which would mitigate unemploym during the winter and stimulate trade. Minister of Labour is to be invited to a c ference in Birmingham, when the project be discussed.

Proposed Severn Bridge.



It is proposed to construct at Beachley, Monmouthshire village on the banks of Severn, where the Government shipyard established during the war, a combined r and rail bridge, which would bring Lon forty miles nearer to South Wales, and Bri the Midlands, the West of England, and So ampton seventy miles nearer. At present, road bridge nearest the sea is at Glouce which means a detour occupying three-an half hours for the great volume of motor tr between Bristol and South Wales.

THE ROYAL SANITARY INSTITUTE.

ANNUAL CONGRESS—III.

Two papers, entitled, "Regional Planning, Drainage, and Sanitation," by Mr. T. H. Johnson, and "Compulsory Town Planning: Should it be Extended," by Mr. J. A. Rosevear, were taken as read, and discussed together.

REGIONAL PLANNING.

Mr. Johnson's paper stated that in regional planning as understood and practised at the present day a Regional-Planning Committee was usually formed, made up of a number of local authorities, from county boroughs to rural councils, acting as a Regional-Planning Committee, and it would appear at first sight that the various conflicting interests likely to be involved would make it impossible to produce a coherent scheme of such a character as would commend itself to the general body of the members of the Committee. In practice, however, that was found to be usually the reverse. The various surveyors and clerks were generally enthusiastic for the work, as they realised the importance of united and concerted action.

The cost of regional planning must necessarily vary very much, and as only one regional survey had yet been made in England no definite figures were forthcoming on which any basis of cost could be calculated. It might be taken, however, that the larger the area to be dealt with the lower would be the cost in proportion. It would appear that the fairest way of apportioning the cost of the preparation of a regional-planning scheme was by basing each authority's contribution on its rateable assessment.

A regional-planning scheme was not only of benefit to the inhabitants of the area regionally planned, but had far-reaching effects in addition. It should be borne in mind that a short length of a regionally-planned road often not only served the interests of the surrounding community, but might so shorten a through line of traffic as to become a national asset of great importance.

In deciding on the extent of a regional-planning scheme regard should be had to the character of the district and the community of interest both commercial and social of the various co-adjoining authorities. Generally speaking, a regional-planning scheme to be effective should be as large as possible without becoming unwieldy. Circumstances, such as the existence of a valley, or the presence of a wide river, alone determined the extent and scope of a regional-planning scheme. It would be no part of the duty of the regional committee to interfere with the individual town-planning schemes of the various authorities forming the Joint Committee.

The Joint Committee would determine details, but broadly speaking a regional-planning scheme should deal with:—Communications by road, railway, and waterways; the zoning of areas for housing, manufacturing (including specific trades if necessary), and recreation; the preservation of features of local and historical interest and beauty; the health of the population; water supply; industry and motive power; any special problems peculiar to the district, such as coal mining and its attendant difficulties; drainage; and sanitation.

It was impossible to travel far in any direction in industrial England without seeing how the want of zoning and a proper appreciation of some form of guidance of commercial development in the past had caused most valuable sites for industrial purposes to be used for housing, and, on the other hand, most suitable land for housing was being used for works purposes. There could be no question as to the advisability of selecting the very best and highest sites for housing purposes; the economy of a gravitation sewage scheme as against that of a sewage scheme requiring pumping was obvious. The health of a population housed on high ground made for efficiency. A population living on a low damp site must contain a large number of inefficients, with a consequent loss to industry.

The provision of an unlimited supply of pure water was of the greatest importance to any community, and became more difficult as time passed. There was no doubt that in the past an unfair advantage had been taken by the large cities, who had been able by reason of their wealth to tap large and far-distant gathering grounds, taking water out of one valley into another and frequently depriving the inhabitants of their fair share of water gathered in their own valleys. The time appeared to have now arrived when the water resources of the whole country should be dealt with on proper regional lines. The result would undoubtedly be the saving in the future of an enormous sum in costly litigation. The feeling that a wealthy Corporation could force the pace and anticipate its wants to the injury and loss of the less fortunate and poorer authority would be done away with. More and stringent powers were necessary to allow of the impounding of supplies of gathered water now used for industrial purposes, and the substitution of water obtained from wells, and the reduction in the amount of compensation water sent from many of the reservoirs which in so many cases is made little, if any, use of. Many industrial areas were at the present time using water up to the extreme limit of their supplies, and as practically every watershed had been earmarked by some authority or other water in the future must be obtained from bores or additional bores, and again it was quite impossible in many cases for local authorities to obtain suitable water from bores in their own areas. The formation of regional water boards and the pooling of the resources of the various valleys appeared to be the only solution for the future water supply to the population of industrial England.

SHOULD TOWN PLANNING BE EXTENDED?

Mr. Rosevear's paper stated that the need or town planning at the present juncture appeared to be all-compelling and insistent in view, first, of the large amount of private building now taking place in and around cities and towns, and, in fact, in all parts of the country; and, second, the new housing schemes about to be commenced by local authorities, with the assistance of the Government, under the new Housing Act.

In considering the case of undeveloped areas in county, urban and borough areas, it had to be remembered that Clause 16 of the Housing, &c. (No. 2) Bill, 1923, extended the time from three to six years within which local authorities who were under the compulsory powers, had to prepare and submit schemes. That, he considered, if passed into law, would be a retrograde step and play further into the hands of dilatory authorities. It seemed to him it would have been better policy to stipulate that the preliminary statement or draft scheme should be prepared and submitted within three years, and the final scheme within the extended period of, say, six years, if necessary. That would have ensured some steps being taken in the near future.

Many rural areas were in close proximity to busy cities and towns, and in order that a proper main road system, including securing the necessary widths, might be established, it was most necessary that compulsory powers be applied to such areas, which frequently were a bugbear to their more progressive neighbours. The predominant use to which such areas would be put should also, so far as possible, be fixed at an early date in order that user of the adjoining areas might be co-ordinated with such and not be mutually destructive. Thus far schemes in such areas should proceed within, say, three years, leaving detailed schemes to be prepared at a later date when the necessity arose.

The problem of built-up areas was not a new question by any means. Instances of the need of control at the present time occurred on every hand, more especially in districts where the ground leases were falling in and the freehol reconstructing or rebuilding, in many for quite a different type of user, which w tend to alter the character of the parti area and might in fact very materially depre the surrounding property. Also, frequentl such rebuilding a larger area was covere buildings, and so further congestion occurr those central portions of the town. Prov the new buildings complied with the by-laws, speaking generally, no contro objection could be exercised or sustained b local authority, whatever the use to which buildings might be put. It would be real therefore, that in course of time in a parti locality the outskirts might be planned developed upon the best possible lines proper allocation of industrial, residential business areas, and with adequate open sp but at the same time the central portions m be a mass of congestion and ill-assorted b ings, used for many and varied purposes, wit any regard to the amenity or convenienc the occupiers, and that state of affairs w yearly grow worse.

It was suggested that compulsory powe regard to the town planning of such areas necessary, and to bring built-up areas into such powers should by Statute have t exercised by local authorities within a pe of three to six years. The first necessity w be to zone the built-up area as regarded pre user and to control the future redevelopm both in relation to and forming a part of comprehensive town plan for the locality. S powers would enable the clearance and re struction of unhealthy and congested area be carried out as an integral part of the t planning scheme.

Similar powers over the whole town, centre and outskirts, had been exercised in United States for some time, and the busi community and those especially acting property interests were the most enthusi in support, recognising that not only the munity but the individual benefited from ordered control in the long run.

Discussion.

Mr. A. J. Martin said it was pitiful to see difficulties caused by the lack of co-opera between different local authorities. If feeling against joint action could be overc it would be a very great benefit to community.

Mr. Campbell (Edinburgh) urged regional and town planners should not be ir great a hurry, as ideas on the subject continually changing. For instance, a few y ago it was thought better to start planning the centre of a town and work to the outsk ideas had now completely altered, and it thought better to work from the outl districts towards the centre. Also, a few y ago many town planners advocated planning schemes, but it was now gene accepted that the more elastic the scheme better.

DOMESTIC USES OF ELECTRICIT

A paper by Mr. W. A. Vignoles, M.I. Borough Electrical Engineer of Grimsby "Hygienic Aspect of Electricity in the Ho was taken as read.

It was pointed out in the paper that elect to-day was used in the home for lighting, ir cleaning and for power purposes as well heating and cooking, while satisfa apparatus for providing hot water by the electricity was now being put on the mar

The widest use was, of course, for lighting poses, and the massed public opinion was electricity was without a rival for this pu owing to the absence of products of combu He thought it needless to labour that poi he felt they would all agree, and though h heard many ingenious arguments from interested in other methods of illumin these undoubtedly carried very little weig

With electric light, the paper continu was possible to have rooms of a less heigh with other methods of illumination, and, cubic space must remain constant owing

ost, it followed that if electricity was used the oor-space could be increased with considerable enefit to the occupiers. That was a point hich was not always appreciated.

Until comparatively recent years electricity as practically confined to lighting, but when ectric irons were introduced they rapidly btained a hold, and were now very largely used. he iron gave the housewife some indication of hat electricity could do to help her. If she as provided with an iron and an electric asher, the terrors of washdays had gone.

With the old method of washing the woman ood for hours over the tub, wearing out the rength which she required in order to look ter her children and her husband. With the lp of electricity she could fill her washer with othes, put in the hot water, set the machine work, and then go upstairs to do the beds hile the machine did the work for her. As to pense, a shilling per week would, under most riffs, pay not only for the power used in the achine, but would also heat the water required.

The domestic vacuum cleaner was a great set to the home. It was the only reasonable stem for removing dust from the house. weeping only stirred up more dust, while the ister must be about the most inefficient achine that was ever thought of. The vacuum eaner removed the particles of dust—each rhaps with a number of microbes clinging to —from the house, and enabled them to be nveyed in comfort to a suitable receptacle.

A great deal of dirt could be avoided by the e of electric heaters instead of coal fires. ith any other method of heating a flue must provided and a large amount of heat was cessarily wasted up the chimney, whereas ith an electric heater the whole of the heat veloped could be usefully applied. The ater being set just at the point where it might wanted, the net result was that for occasional ating, such as for bedrooms, dining-rooms, or her places used intermittently, electricity uld be used not only conveniently but onomically. Probably the best solution, in a all house, was to use one coal fire, which could o be arranged to provide the necessary hot ter during the winter months, and then to electricity for the occasional heating required other rooms and for providing hot water ring the summer time.

In the last few years great advances had been de in electric cooking, and it had now been veloped to such an extent that it was possible undertakings to hire out cookers at rentals about 10s. a quarter, and with electricity at rice of 1½d. per unit downwards electric king became a serious practical proposition— only for the rich man, but also, and perhaps e particularly, for the housewife who did own work. With the development of the tric cooker, which could be used in any tion, as no flue was required, housing design simplified, and a number of houses now g built were arranged for electric cooking , the stoves being eliminated and the cost of flues saved. Enough data had been ered to enable the cost to be ascertained y closely, and it was generally considered for a household of four 28 to 30 units of tricity per week would be consumed if all cooking were done electrically; at 1¼d. nit that would work out at 3s. 1½d. per week. ideal for a house was one where there was m that was generally fitted with a fire to h the hot-water cistern was connected, e electricity was used for lighting, cooking or the heating required in other rooms than ne mentioned, and as an auxiliary for the ater supply. With such an arrangement, with an electric washer and iron, it would erfectly possible for a woman to do the work of the house under the best condi- and with enormously increased comfort mpared with the ordinary methods of y.

Discussion.

A. J. Martin (London) referred to the ce of products of combustion in a room d and lighted with electricity, and said it had been abundantly shown that the air in a room heated by gas or coal was purer than that in a room lighted by electricity.

Mr. W. B. Smith (Glasgow) said the Departmental Committee on Smoke Abatement could only guardedly recommend the adoption of electricity for small houses on account of the high cost. In Glasgow they charged 4½d. per unit for domestic lighting and 1d. per unit for other purposes, and that price was sufficient to make it a paying proposition. In some of the new houses at Glasgow they were supplying electricity for power purposes in small houses at ½d. per unit, and, although the Corporation did not desire to make a profit, there would be no loss. He thought electricity was ideal for cooking purposes, but the electricity undertakings would have to reduce their charges; supply undertakings could very well do that, because the cooking was done at times other than the peak-load periods.

Mr. H. D. Searles-Wood, F.R.I.B.A., said architects often complained about the position of electric plugs on walls; personally, he preferred plugs in the floor, where they would not be so much in evidence and where children would not be so able to get their fingers into them so easily.

Mr. Watson (Birmingham) said he had found difficulty in measuring electricity so as to reduce the cost of meters as much as possible. He had tried putting one meter to serve a row of cottages and dividing the cost amongst several tenants, but it had not been really successful because he had found that one of the tenants had put in a cooker and was getting more than his share.

Mr. Edward Willis, M.Inst.C.E. (Chiswick), said he had found one little difficulty in using electric irons, as one in use in his house had been put down after use without being disconnected, with the result that a fire had been caused.

In replying to the discussion, Mr. Vignoles said it had been claimed that the air was purer in a room where products of combustion were discharged, but he had never been satisfied that the evidence was sufficient to prove that that was so; in a room 9 ft. or 10 ft. high lighted by gas it would be found that the air near the ceiling was a great deal polluted. The question of fuses blowing was a difficulty, but it could be overcome. The continual working of an electric iron would fray the flexible cord, but a spring connection at the end of the cord would prevent the twisting from affecting one point only. With regard to the price of electricity, some of the supply undertakings were not doing as much as they should to promote the use of electricity in small houses. There were, however, a great many undertakings which were now supplying power for heating and cooking in the neighbourhood of 1d. a unit; at Grimsby the price was 1¼d. a unit. At such a price nothing could touch electricity as a medium for heating and cooking on the ground of cost. It would hardly be economical for heating water, but a separate coke-fired boiler would overcome that problem. With electric cooking the amount of food wasted was very much less than by any other method. The reason was that in cooking a joint by electricity the oven could be started at a high temperature so that none of the juices in the meat would be lost, and then switched off altogether for a time until the proper temperature was reached. The position of plugs and switches was a matter in which electrical engineers required the assistance of architects. He did not like to put plugs in the floor because dust dropped into them. He thought all plugs should be controlled by switches, and that would obviate the danger of children getting a shock through putting their fingers into the sockets. One great advantage of electric radiators was that there was no need to have a flue, with a resulting saving in building costs. In Grimsby they were supplying a number of houses at an inclusive charge of 1s. 6d., a week for lighting only; no meters were fitted, but there was a limiter to prevent more than a certain amount of electricity being taken at one time. He thought the danger of the switches of electric irons being left on could be avoided by installing a small signal lamp which would be alight whilst the iron was in use and be switched off when the iron was not in use. One iron on the market was fitted with a switch in the handle so that the electricity would only be "on" when the iron was actually in use, but the disadvantage to that was that someone had to hold the handle until the iron became hot.

PERCOLATION IN CHALK.

A paper by Mr. George F. Carter, M.Inst.C.E. (Borough Engineer of Croydon), stated that a geological section taken across the London basin showed the chalk strata in a trough-shaped form made by elevation of the sides or depression near the centre. Where the chalk was exposed at its outcrop near the overlying tertiaries there were fissures or crevices allowing water to pass freely into the mass. There were no streams or rivers in the outcrop except at times when the level of the surface in a valley or depression happened to be below the water level or level of saturation, when temporary streams or bournes were formed. The water, however, which passed into the chalk must have an outlet, if not underground into the sea, and it was returned to the surface by overflowing at the junction with some impervious stratum. Where water overflowed the chalk on to the impermeable clays or rocks there were streams or rivers.

Below the tertiaries the chalk was generally hard and compact, due to the superincumbent pressure, and consequently not freely permeable. Even in the open chalk its character likewise varied and at depths of, say, exceeding 200 ft., might be hard and contain few water-bearing fissures. It was the fissures in the chalk which contained the useful water, that in the body of the chalk or water of capillarity being of no avail for waterworks purposes. Useful water for public supplies, at all events in the South Metropolitan area, must generally be looked for even on the chalk at moderate depths, generally within 200 ft. of the surface.

In South London the outcrop of the chalk near the tertiaries was at a level of about 100 to 200 ft. above ordnance datum and at the escarpment the surface of the chalk varied from about 400 to 800 ft. above ordnance datum. If the chalk were freely permeable under London, so long as any water showed at its junction with the tertiary beds as it generally did—as the source of permanent rivers—there would be no deficiency in the London wells, but experience proved that the water level in those wells was constantly falling regardless of seasons and occasional copious bourne flows.

Several wells in Croydon for trade supplies had been bored through the tertiaries to great depths within half a mile of the chalk outcrop and only resulted in small yields of 4,000 to 20,000 gallons daily, and in many cases the owners had given them up and resorted to the public supply. That was the more startling, as just in the outcrop of the chalk only a short distance away were wells giving one to three million gallons daily.

Mr. Baldwin Latham had stated from his observations that water obtained from wells under London, although such wells were bored into the chalk, was not water abstracted direct from the chalk. The chalk under the tertiaries being hard and compact, water passed along the Thanet sand over the chalk and it was the water conveyed in this manner that was taken. He mentioned as proof of that theory the softer nature of these waters compared with that abstracted from the chalk.

There was an area of chalk which was first defined by Mr. Baldwin Latham of about 23 sq. miles, taking a part of Croydon and the district to the west and south, and from observations that were first made by him and carried on by the lecturer there was reason to believe that a fair computation of the yield of that area can be obtained by recording the water passing into the River Wandle and the quantity pumped from the wells of the Croydon Corporation and the East Surrey Water Company. It was submitted that from that area the balance of the

water not pumped at those wells drained into the bourne culvert (purposely constructed to receive subsoil water) connected to the River Wandle and partly through springs in or near the river and could be gauged. There was also an average of one million gallons daily passing away as subsoil water on to the Beddington Farm. Practically very little water passed away under the tertiaries at that place due to the hard, close nature of the chalk. The paper concluded with tables showing the rainfall, evaporation, and chalk percolation for the years 1918, 1919, 1920, 1921 and 1922, and a diagram showing the rainfall, percolation, and water accounted for in the Croydon chalk area from 1913 to 1922.

The following are interesting passages from papers read before other sections :—

Problems of Municipalities.

Mr. Ernest J. Elford, M.Inst.C.E., Borough Engineer and Surveyor of Wandsworth, in his presidential address to the Section of Engineers and Surveyors to Sanitary Authorities, dealt with those problems which he thought would present the most serious municipal problems in the future. These were sewage disposal, refuse disposal, and housing. Dealing with sewage disposal, he said : Notwithstanding the fact that sewage effluents of high standard, certainly good enough for all practical purposes, were being consistently produced, a number of important problems still remained to be solved. Perhaps the most difficult was the question of the treatment and disposal of sludge, and its profitable utilisation. The activated sludge process appeared to mark an appreciable advance by (1) facilitating purification, (2) reducing the smell and fly nuisance, and (3) by producing a sludge of higher manurial value. The discovery of some simple, economical method of dewatering sludge would materially assist in the solution of most of the outstanding problems.

On the question of refuse disposal, he pointed out that the disposal of refuse from the Metropolis was a problem of great difficulty, principally because of its magnitude. The quantity involved was over 1¼ million tons per annum, and at the present time practically the whole of it was dumped upon land in surrounding districts. That that method of disposal was open to serious objection was admitted, he said, and the regulations issued recently by the Ministry of Health, although involving increased cost, had been generally approved. There was no doubt that the time must soon come when local authorities concerned would be compelled to adopt some improved system of disposal.

His view was that the housing problem was more important and pressing than any of the others to which he had referred. The new Government Housing Bill was intended primarily to stimulate and encourage private enterprise ; it must be borne in mind, however, that private enterprise could not at present profitably build working-class dwellings to let—in fact, very few houses of any class had been built to let for some years past. The majority of those whose need was greatest were not in a position to purchase a house, even with the assistance available under the new Housing Bill. It was obvious, therefore, that as working-class dwellings were not an economic investment there was little chance of their being provided unless local authorities continued their building operations until conditions were more favourable. That conclusion might be very unpalatable, but it was a fact, and it was in the public interest that it should be boldly faced.

Smoke and Tuberculosis.

In a paper read before the Section of Sanitary Science, on "The Prevention and Cure of Pulmonary Tuberculosis," Dr. Percy Hall, M.R.C.S., L.R.C.P., called attention to the importance of housing conditions in the prevention of tuberculosis, and gave his opinion that if the present wasteful methods of fuel consumption which resulted in a smoky and fog-laden atmosphere were superseded, and electricity developed as a means of heating, lighting, and cooking, we should go a long way towards stamping out the disease.

ENGLISH CATHEDRAL CITIES *

These delightful handbooks on the cathedrals are of convenient size for reference in the buildings themselves, and are written and illustrated in a way to appeal to non-technical readers as well as to students of architecture and construction. Each volume deals with one cathedral and is composed by an author whose learning and interest in his subject guarantee its serious treatment.

In the case of Chichester Cathedral, by Mr. Hubert C. Corlette, F.R.I.B.A., the history and the structure of the building are followed step by step in a manner that shows an intimate knowledge of the building, its detail, and of contemporary events at the time of its erection. The speed of the early builders is remarked upon in connection with the spread of building methods and of architectural style. Canterbury choir, "commenced and completed between the years 1174 and 1184," is used as argument to supply an approximate date for the execution of the nave vaulting at Chichester after the fire of 1186 and before the rededication of the building in 1199.

We are apt to think that before the invention of steam-driven machinery great speed in building construction was impossible, but our machinery is, after all, only a substitute for hand-work, and while the output of a machine is strictly limited, that of a building gang may often be increased by the employment of more men.

The whole development of vaulting is affected by its introduction into English Gothic buildings as a means of resisting the spread of fire to the timbers of the roof, and at Chichester the high vaults were only designed as an afterthought when the original flat wooden ceiling had been burnt down. Many of the features of building construction peculiar to our Gothic architecture can be traced to this super-addition of vaulting to buildings originally designed for lighter ceilings of wooden beams, which pressed in a more nearly vertical direction upon their supports. The ancient Romans and the Orientals of the present day manage to erect vaults without the aid of an external skeleton framework of buttresses and flying buttresses that were made necessary when vaults were built in Gothic times on piers and walls too high and too thin to carry them without some extra provision to keep the lateral thrust of the vault in equilibrium.

Speaking of the rebuilding of the central tower and the arches of the crossing, Mr. Corlette says : "Bishop Ralph Neville died in 1244, so it is concluded that the work in which he was so interested was none other than the central or bell tower of the Cathedral, and that the earlier tower, with its supporting arches, must have fallen, else it is not likely that the work would have been rebuilt from below the spring of these arches before the new superstructure could be added ; for we are obliged to take the customs of mediæval builders into consideration in any attempt to sift the evidence concerning their work—and they were before all things practical. The claims of structure, the motives of common sense, rather than abstract æsthetic ideals of beauty, were the prime causes at work in the evolution of their great art." The tale of the collapse of this tower after it had carried itself for five hundred years and borne the addition of a tall spire is retold in the words of Professor Willis, which record the futile efforts of the carpenters to shore up the falling structure between February 17 and February 21, 1861. The heroism of this lost endeavour is indicated in Professor Willis's sentences : "On Wednesday crushed mortar began to pour from the old fissures, flakes of the facing stone fell, and the braces began to bend. Yet the workmen continued to add shoring until three hours and a half past midnight." At an earlier period the spire had been repaired by Sir Christopher Wren and furnished with a gigantic pendulum to stabilise it when subjected to violent gusts of wind. A great deal of information is also imparted by the photographic views illustrating the series, and the vigour and grace of our early Gothic art could hardly be better exemplified than in the two pictures of the retro-choir at Chichester, where the circular pier, with its four satellite shafts, is shown against a background of beautifully proportioned arches and dainty sculpture.

MALDENS AND COOMBE HOUSING SUBSIDY.

With reference to the complaint that the Ministry of Health had refused a subsidy for parlour houses for the Maldens and Coombe area, reported in last week's *Builder*, the Minister of Health states that "the Ministry is not withholding subsidy under the new Housing Act in the case of houses with parlours, or discouraging the provision of parlours. Such suggestion is entirely without foundation. As a fact, in many cases, proposals for subsidising the erection of parlour houses have already been approved. The Housing Act requires that, before approving proposals submitted to him, the Minister shall be satisfied that the need for such houses cannot be met without assistance under this Act. In the case cited the Minister was not satisfied that the need for the proposed houses could not be met without assistance. On the contrary, clear evidence was submitted to him that builders in the district could obtain a fair profit for these houses without any subsidy at all."

PEDESTRIAN RIGHTS.

"Experto Crede" writes :—

Sir,—With the passing of horse traffic and the innovation of mechanical traction, drivers are filching, either by ignorance or design, the use of the crossing and continuous footway of the pedestrians, who have by remote custom a pre-emptive right to its use.

As to pedestrians on public rural roads, it seems fatuous that any able man should be unemployed, and in receipt of a dole, when hundreds of miles of roads, many extremely narrow, are without footpaths, as also are main roads, with much of the space lying in absolute waste and covered with open water gaps to conduct the water from the road surfaces into the ditches, the pedestrian now being compelled to exercise his agility in crossing them if he elects to leave the roadway. With a 6-ft footway three 4-in. stoneware pipes would permit these gaps to be levelled, and the footway being formed above the road level the pedestrian would preferably keep off the road, or at least be induced to do so. Where roads are of a narrow width and of a special nature legislation should immediately be applied with compulsory powers to acquire abutting land for giving a minimum width of 30 ft. to any public road (18 ft. to the road, with 12 ft. to the footways preliminary ; one footway of 6 ft. being first provided for public use, and where it is found of sufficient size and capacity, it could remain until necessity arose for the use of the other one, the decision of adoption being left to local authorities. There are many roads within 2 miles of London dangerously narrow, with hedges and banks on each side, that require a footway for public safety. Motorists would be much relieved by this work being carried out, and this could be a simple stock job for the unemployed in every locality. Where abutting owners have erections, orchards, gardens, or cultivated land out to the limited boundary of any road, and there is a difficulty of providing the necessary width, a local tribunal could be formed to adjust any alternative proposition or by arbitration decide any compensation claim thereon, or arrange any slight diversion to avoid unnecessary cost or inconvenience. The road repair fund and the dole saved should suffice to cover the cost.

THE BUILDING TRADE.

HOURS IN THE BUILDING INDUSTRY.

The Arbitrator's Award.

The following Award, made by Sir Hugh Fraser as arbitrator on the question of working hours in the building industry, was issued on Monday evening by the National Federation of Building Trades Employers and the National Federation of Building Trades Operatives, the parties to the Arbitration :—

"I award and direct as follows :—

"1. That the present rule whereby 41½ hours per week are worked during December and January be rescinded, and that the working time of 44 hours per week shall proceed throughout the year, except during the period of summer time as determined by statute (approximately twenty-one weeks, for example, for 1923, on and from April 23 to September 17), when the working time shall be extended to 46½ hours per week by adding half-an-hour to each of the first five working days of the week.

"2. In December and January, on works where artificial light can be reasonably supplied, the interval of one hour for dinner shall be observed, but in those two months, on works where artificial light cannot be reasonably supplied, the interval for dinner shall be reduced to half-an-hour, so that work may terminate during those two months at 4.30 p.m. If, however, on any such works where artificial light cannot be reasonably supplied the majority of the operatives request that the interval of one hour for dinner may still be maintained throughout December and January, and that the working hours during that period may be consequently reduced to 41½ hours per week, the employer shall be at liberty to arrange accordingly, such shortened working hours thus becoming an occasional exception and not a general rule, as at present.

"3. Nothing in this Award shall prevent employers and operatives in any town or area from maintaining by mutual consent the 44-hour week throughout the year.

"4. As it is not desirable to interrupt the existing working hours for a brief period of a few weeks during the present summer, this Award shall not come into operation until September 17, 1923."

The assessors in the arbitration (Mr. B. I. Greenwood and Mr. A. G. Cameron) and the representatives of the respective parties in the arbitration have signed a statement calling for the loyal observance of the award by all parties interested throughout the country. It is officially announced that the award will be presented to the next meeting of the National Wages and Conditions Council when instructions will be issued to all parties concerned regarding the application of the conditions contained in it.

THE COST OF BUILDING MATERIALS.

The second interim report of the Inter-Departmental Committee on the Prices of Building Materials, published last week, states that, with regard to pig iron, the raw material for light castings, the price of No. 3 Cleveland on July 17 was 107s. 6d. a ton, as against 115s. a ton on June 27.

As to the supply of bricks, the report states :—"In Scotland there was a surplus of bricks, and in England and Wales—with the exception of London and the south-east—the supply appears to be adequate. In London and the south-east, owing to the bad outlook of trade last winter, the output of bricks has not been as large as events have proved to be desirable, and there may at the moment be cases of local shortage. The general supply is, however, likely to increase in the near future ; this year's output of stocks is already in part available and a larger supply should shortly be forthcoming. In the meantime the Fletton output is steadily increasing ; the production of Flettons for the month of June was 38,000,000, as against 33,500,000 for the month of May, and 23,000,000 for the month of January. In view of these facts, we think purchasers should hesitate to pay increased prices for prompt and preferential delivery."

The report of the Chairman (Sir Halford J. Mackinder) to the Minister of Health points out that in the last two months there have been a good many local fluctuations which extended to almost all of the materials under consideration. Common bricks have increased in price in one locality by as much as 6s. per thousand, and have decreased in another by as much as 5s. In the main there has been a tendency slightly to increase the price of bricks. Timber, except flooring, and lead have been somewhat easier in price and, for the remainder, the fluctuations by way of increase and decrease have approximately balanced. Schedules attached to the report give the prices of building materials in different centres in the United Kingdom ; the Schedule relating to London is given on this page, and others on pp. 302–3.

BUILDING TRADE CONDITIONS.

At the annual conference of the National Federation of Building Trade Operatives at Ilfracombe, last week, a resolution was carried instructing the Executive to do their utmost to establish one big union for the building industry. The Executive will report to an amalgamation committee, which will hold a meeting in the near future.

Mr. Thomas Barron (Amalgamated Society of Woodworkers) was elected President of the Federation for the ensuing year, in succession to Mr. George Hicks, who had resigned.

The question of the co-ordination of the affiliated societies' organisers under the National Federation was discussed, and it was decided to defer the whole matter to the emergency committee.

The question of a guaranteed full week for building trade operatives was also discussed at considerable length, and the following resolution was passed :—"That this conference of building trade operatives, believing in the justice of payment for lost time through stress of weather, hereby directs the National Federation and the representative on the wages and conditions council to press for the establishment of a guaranteed full week for all building trade operatives, to come into operation as soon as possible."

The conference discussed matters relating to the gasfitters' dispute at Nottingham, and decided that the Federation should confer with the National Union of General Workers with the view of arranging a conference with the Nottingham Gas Committee.

The "inadequacy of the mess-room accommodation on building jobs" was referred to the Executive for negotiation with the Labour Party with a view to legislation.

The conference decided to make national and international inquiries as to the establishment of a trade union bank, as it was suggested that trade unions were too much in the hands of joint stock banks.

Dover Harbour Development.

Pending developments at Dover Harbour include additional wet and dry-dock accommodation adequate for dealing with large vessels. The estimated cost of the new works is a million-and-a-quarter sterling, and application is being made to the Trades Facilities Committee for a guarantee.

LONDON COUNTY COUNCIL.

Prices of Building Materials.

Materials.	Description.	Unit.	April, 1923.	June, 1923.	July, 1923.
Bricks.					
Common	Fletton	1,000	49/3	52/–	52/3
Facing	Picked stock	1,000	65/–	65/–	65/–
Lime and Cement.					
Portland Cement	English	Ton	47/10	44/–	44/–
Lime	Grey stone lump	Ton	43/10	43/10	43/4
Lime	Chalk ground	Ton	38/6	37/6	37/6
Timber					
Carcassing	7″ × 2″ Swedish red (4th quality)	Standard	£18 12 6 to £19 12 6	£19 2 6	£21 7 6
Flooring	Swedish white, 1″ plain	Square	18/10 to 19/9	19/5	—
Lead.					
Sheet	British manufacture	Ton	£32	£32	£28
Piping	British manufacture	Ton	£32	£32	£28 10
Cast Iron.					
R.W. pipes	3″ dia. ⅛″ metal	Yd. lin.	—	1/6½	—
Soil pipes	3½″ dia. 3/16″ metal	Yd. lin.	3/1	3/1	—
Bath	5′ 0″ Greenstone enamel with a 2″ roll with feet but without fittings	Each	—	£3 17 6	—

All prices relate to special purchases made for the L.C.C. for their housing scheme and are for delivery on site except those for facing bricks, timber and cement, which are for "in barge alongside private jetty."

From the Report of the Departmental Committee.

THE RENT ACT AS FINALLY PASSED.—I.

As the Rent Bill, now known as the Rent and Mortgage Interest Restrictions Act, 1923, was amended in the House of Lords, it may be well to consider the Act in the light of our former articles showing what alterations were effected after the Committee stage in the House of Commons. Section 1 is unaltered, and, subject to the provisions of this Act, it continues the Rent Act, 1920, until June 24, 1925.

Where Possession Excludes Restriction.

Section 2, subsection (1), remains unchanged. Its effect is that, where a landlord at the time of the passing of this Act (July 31, 1923) is in possession of the whole of a dwelling-house to which the Rent Act, 1920, applies, or comes into possession of it at any time after the passing of this Act, then the principal Act shall cease to apply to that house. There are two provisos to this—(1) Where part of the house is lawfully sublet, and that part is also a dwelling-house under the principal Act, the principal Act will not cease to apply to the part so sublet, but if the landlord comes into possession of any part not so sublet, the principal Act shall cease to apply to that part. (2) If a landlord comes into possession under an order or judgment made after the passing of this Act on the ground of non-payment of rent, then, notwithstanding the foregoing provisions, the principal Act shall not cease to apply.

Leasing Houses.

Subsection (2) is unaltered. Its effect is where, after the passing of this Act, the landlord of a house to which the principal Act applies leases, or agrees to let, a house for a term ending at some date after June 24, 1926, not being a term of less than two years, the principal Act shall, as from the commencement of the term, cease to apply to that house, and nothing in the principal Act shall affect the payment of any agreed sum as part of the consideration for such lease or agreement, but, if at that time part of the house is lawfully sublet, the principal Act shall continue to apply to that part. Subclause (3) in the Bill, which dealt with licensed houses, has been removed to section 4 in the Act, and a new subsection takes its place; that subsection is "For the purposes of this section" (*i.e.*, section 2) "the expression 'possession' shall be construed as 'actual possession,' and a landlord shall not be deemed to have come into possession by reason only of a change of tenancy made with his consent."

We now come to section 4, which is new, and which we set out in full: "Where, before the passing of this Act, the landlord of a dwelling-house to which the principal Act applies has granted to the tenant a valid lease of the dwelling-house for a term ending at some date after June 24, 1923, or has entered into a valid agreement with the tenant for a tenancy of such a term and the rent thereby reserved is reserved at a rate which after, but not before, such last-mentioned date exceeds the standard rent and the increases permitted under the principal Act or this Act, the landlord may, by three months' notice in writing, expiring not earlier than December 21, 1923, and not later than March 31, 1924, determine the said lease or tenancy, provided that if within a month of the receipt of such notice the lessee or tenant shall give to the landlord notice in writing that he elects to abide by the said lease or agreement and the terms thereof, then the said lease or agreement shall remain in full force and effect in every respect, including the amount of the rent thereby expressed to be reserved, unaffected by the principal Act."

Restrictions on Possession.

Section 4 of the Act now represents clause 3 of the Bill, and for convenience, as that clause introduced many amendments into section 5 of the principal Act, the whole of this section is now reproduced in the Act as amended, but we shall only refer to the amendments which have been introduced. The Bill amended paragraph (*b*) of section 5, subsection (1), and this paragraph appears in the Act unaltered from how it stood in the Bill, and it will be remembered that the paragraph provides that possession can be claimed where any person residing with a tenant or lodging with him or being his subtenant has done the acts specified in the paragraph, been a nuisance, committed waste, etc., but where the person is a lodger or subtenant, the Court has to be satisfied that the tenant has not taken such steps as he ought reasonably to take for the removal of the lodger or subtenant.

Paragraph (*d*) was the next paragraph amended, and in the Act this paragraph remains the same as in the Bill, save for the provisions as to alternative accommodation, that is to say, the house must be reasonably required by the landlord for himself or for a son or daughter over 18, or for some person *bona-fide* residing with him, or for some whole time employee of himself or of his tenant, or with whom a contract conditional on housing accommodation has been entered, "and (except as otherwise provided by this subsection) the court is satisfied that alternative accommodation is available which is reasonably suitable to the means of the tenant and to the needs of the tenant and his family as regards extent, character, and proximity to place of work, and which consists either of a dwelling-house to which this Act applies, or of premises to be let as a separate dwelling on terms which will afford to the tenant security of tenure reasonably equivalent to the security afforded by this Act in the case of a dwelling-house to which this Act applies."

Paragraph (*h*), added to the subsection, stands as in the Bill, making it a ground to claim possession if a tenant, without the consent of the landlord, has after July 31, 1923, assigned or sublet the whole of the dwelling-house or sublet part, the remainder being already sublet. There is a new paragraph here inserted in the subsection numbered (*i*) allowing possession where "the dwelling-house consists of or includes premises licensed for the sale of intoxicating liquors, and the tenant has committed an offence as holder of the licence or has not conducted the business to the satisfaction of the licensing justices or the police authority, or has carried it on in a manner detrimental to the public interest, or the renewal of the licence has for any reason been refused."

We now come to those paragraphs in the section (4) which deal with cases where alternative accommodation is not a condition of an order for possession being made, but it is to be observed that alternative accommodation is not made a condition in all the cases

(*See p.* 301.

dealt with in the foregoing paragraphs. It is only necessary for us to refer to paragraph (iv), as in the Act this has been recast, and now forms two paragraphs as follows: (iv) "Where the landlord or the husband or wife of the landlord became the landlord before June 30, 1922, and the dwelling-house is reasonably required by him for occupation as a residence for himself or for any son or daughter of his over 18 years of age." (v) "Where the landlord or the husband or wife of the landlord did not become the landlord before June 30, 1922, and the dwelling-house is reasonably required by him for occupation as a residence for himself or for any son or daughter of his over 18 years of age, and the Court is satisfied that greater hardship would be caused by refusing to grant an order or judgment for possession than by granting it."

In the Act all the subsections of section 5 of the principal Act are reproduced, but it is only necessary to refer to subsection (6). In the Bill certain amendments were only indicated, and they now appear in the Act as follows: Subsection (6) "Where a landlord has obtained an order or judgment for possession or ejectment under this section on the ground that he requires a dwelling-house for his own occupation, and it is subsequently made to appear to the Court that the order or judgment was obtained by misrepresentation or the concealment of material facts, the Court may order the landlord to pay to the former tenant such sum as appears sufficent as compensation for damage or loss sustained by that tenant as the result of the order or judgment." Subsection (7), a new subsection, provides "The provisions of the last preceding subsection shall apply in any case where the landlord has, after July 31, 1923, obtained an order or judgment for possession or ejectment on any of the grounds specified in paragraph (*d*) of subsection (1) of this section, and it is subsequently made to appear to the Court that the order or judgment was obtained by misrepresentation or concealment of material facts, and in any such case the Court may, if it thinks fit, in addition to making an order for payment of compensation by the landlord to the former tenant, direct that the dwelling-house shall not be excluded from this Act by reason of the landlord having come into possession thereof under the said order or judgment, and if such direction is given this Act shall apply and be deemed to have applied to the dwelling-house as from the date mentioned in such direction."

Increases of Rent and Repair.

Clause 4 in the Bill is now section 5 in the Act. It relates to the suspension of increase of rent on the ground that the premises are not in a reasonable state of repair, and there has been no alteration in the clause as passed by the Committee.

Amending Notices of Increase.

Clause 5 in the Bill, now section 6 in the Act, has been altered. It now reads: "The County Court, if satisfied that any error or omission in a notice of intention to increase rent, whether served before or after the passing of this Act, is due to a *bona-fide* mistake on the part of the landlord, shall have power to amend such notice by correcting any errors and supplying any omissions therein which, if not corrected or supplied, would render the notice invalid, on such terms and conditions as respects arrears of rent or otherwise as appears to the Court to be just and reasonable, and if the Court so directs, the notice as so amended shall have effect and be deemed to have effect as a valid notice." The form of notice in the First Schedule to the principal Act is amended by the substitution of the words "date of service of this notice" for the words "date of this notice." It may be convenient here to notice section 8 of the Act, which did not appear in the Bill: "No increase of rent which becomes payable by reason of an amendment of a notice of increase made by order of the county court judge under this Act shall be recoverable in respect of any rental period which ended more than six months before the date of the order."

Limitation on the Recovery of Payments.

Subsection (2) is as follows: "Any sum paid by a tenant or mortgagor which, under subsection (1) of section 14 of the principal Act, is recoverable by the tenant or mortgagor, shall be recoverable at any time within six months from the date of payment, but not afterwards, or, in the case of a payment made before the passing of the Act, at any time within six months from the passing of this Act but not afterwards." Subsection (3) is: "Nothing in this section shall affect the operation of the Rent Restriction (Notices of Increase) Act, 1923."

Subtenancies and Increased Rent.

There are some alterations in clause 6 of the Bill, now section 7 of the Act. This relates to permitted increases of rent in the case of subtenancies where the part of the house sublet is also a dwelling-house under the principal Act, and it is a complicated section: "Where part of a dwelling-house to which the principal Act applies is lawfully sublet, and the part so sublet is also a dwelling-house to which the principal Act applies, then, in addition to any increases permitted by paragraphs (*a*) to (*e*) of subsection (1) of section 2 of the principal Act, an amount not exceeding 10 per cent. of the net rent of the dwelling-house comprised in the subtenancy shall be deemed to be a permitted increase in the case of that dwelling-house, and an amount equivalent to 5 per cent. of the net rent of the dwelling-house comprised in the subtenancy shall be deemed to be a permitted increase in the case of the dwelling-house comprised in the tenancy." So far the Act follows the Bill, but the following is new: "Subsection (2) of section 3 of the principal Act shall not apply as respects any increase permitted under this section," and there is the following subsection (2): "Where part of any such dwelling-house is so sublet the tenant shall, on being so requested in writing by the landlord, supply him within 14 days thereafter with a statement in writing of any subletting, giving particulars of occupancy, including the rent charged; and, should the tenant, without reasonable excuse, fail to do so, or supply a statement which is false in any material particulars, he shall be liable on summary conviction to a fine not exceeding £2." Subsection (3) is: "In subsection (6) of section 2 of the principal Act the expression 'landlord' shall in relation to a subtenancy be taken to include not only the person who is immediate landlord of the subtenant but also the landlord of that person."

Charges for Furniture, etc.

Clause 7, now section 9 of the Act, has been altered, and is now as follows:—"Subsection (1). Where the purchase of any furniture or other articles is required as a condition of the grant, renewal, or continuance of a tenancy or subtenancy of a dwelling-house to which the principal Act applies, the price demanded shall, at the request of the

(See *p.* 301.)

person on whom the demand is made, be stated in writing, and if the price exceeds the reasonable price of the articles, the excess shall be treated as if it were a fine or premium required to be paid as a condition of the grant, renewal, or continuance, and the provisions of section 8 of the principal Act including penal provisions shall apply accordingly." Subsection (2): "Where a tenant who, by virtue of the principal Act, retains possession of a dwelling-house to which that Act applies, requires that furniture or other articles shall be purchased as a condition of giving up possession, the price demanded shall, at the request of the person on whom the demand is made be stated in writing, and if the price exceeds the reasonable price of the articles the excess shall be treated as a sum asked to be paid as a condition of giving up possession and the provisions of subsection (2) of section 15 of the principal Act (including penal provisions) shall apply accordingly."

The remaining provisions contained in this part of the Act, Part I, remain the same as in the Bill. They are section 10, which relates to houses let with use of furniture, attendance, etc.; and section 11, which relates to the power of a county court to determine questions as to standard rent, and gives the Lord Chancellor power to make rules. The Act deals with matters of great complication, but we have in the present article refrained from any comment, our intention being merely to try and give a general idea of the provisions of the new Act as settled in its final form.

BUILDING TRADE WAGES.

Eastern Counties Regrading.

The Eastern Counties Area Joint Centre Council for the Building Trades has recommended to the National Wages Council, through the Grading Commission, the following regrading of towns in the Eastern Counties area:—

To take effect forthwith.—Regraded, B3 to A3: St. Albans (raised to 1s. 5½d., 2d. increase). Regraded, B3 to B: Brentwood (raised to 1s. 5d., 1½d. increase).

To take effect from November 2, 1923.—Regraded, B2 to B1: Norwich (raised to 1s. 4½d., ½d. increase). B3 to B1: Bedford, Cambridge, Chelmsford district, Clacton, Frinton and Walton, Harpenden, Hatfield, Hemel Hempstead, Hertford and Ware, Hoddesdon, Hitchin, Ipswich, Letchworth, Luton, and Stevenage (raised to 1s. 4½d., 1d. increase).

Regraded, B3 to B2: Colchester, Dovercourt, Felixstowe, Great Yarmouth, Lowestoft, and Newmarket (raised to 1s. 4d., ½d. increase).

Regraded, B3 to C1: Chatteris, Wymondham, and Saxmundham district (except Southwold, which remains in Grade B3), reduced to 1s. 3d., ½d. decrease).

The cases of Colchester, Leiston (in the Saxmundham district), and Wymondham come up for further consideration in January, 1924.

All the other towns in the area are to remain in their present grades, including those from which applications had been received:—In Grade B3, Aylsham, Cromer, Dunstable, King's Lynn, and Southwold.

With the exceptions of Colchester, Leiston, and Wymondham (or any special case considered by both sides to need attention), the grading, as amended above, is to remain stabilised until the July meeting, 1924.

Except St. Albans and Brentwood (where the changes should take place forthwith), the changes in grading to take effect on and from November 2.

All other business on the agenda—a revision of the area working rules, to incorporate the new national rules and other alterations, and the possibility of joint action to strengthen and extend the Council's control of the industry—were referred to the Committees of the Council. The question of Welwyn Garden City was left, to allow Messrs. Ginn (for the employers) and Hubbard (for the operatives) to interview the Welwyn builders and joiners and report again to the Council.

RATES OF WAGES IN THE BUILDING TRADE

The following are the rates of wages in the building trade in England and Wales. Every endeavour is made to ensure accuracy, but we cannot be responsible for errors that may occur:—

	Masons.	Bricklayers.	Carpenters, Joiners.	Plasterers.	Slaters.	Plumbers.	Painters.	Brick-layers' Labourers.	Masons' Labourers.

NEW BUILDINGS IN LONDON.

Piccadilly.—Alterations.—Messrs. G. H. Carter, Ltd., of Holloway, have been selected to carry out alterations and decorations at the Cavendish Club, Piccadilly. Messrs. Knapp-Fisher, Powell & Russell, of Ebury-street, Westminster, are the architects.

Threadneedle-street.—Alterations. — Extensive alterations are being carried out at Merchant Taylors' Hall, Threadneedle-street. The old Court Room, which was erected about fifty years ago from the designs of Mr. Edward I'Anson, F.R.I.B.A., is being entirely remodelled. The oak panelling and the two marble mantelpieces are being pulled down, and also the moulded ceiling. The stonework of the windows is also being removed. The new Court Room is to be panelled in oak, and oak mantelpieces will take the place of those in marble. The entrance corridor is also being altered. The work is being executed from the designs of Sir Chas. Nicholson, Bart., F.R.I.B.A.

Central District.—Telephone Exchanges.—Orders are to be placed immediately by the Post Office for three large automatic telephone exchanges for the Central London district. The advantages of an automatic system are said to be reduced working costs, smaller buildings, and augmented efficiency.

NATIONAL FEDERATION OF CLERKS OF WORKS.

The third annual Council meeting of the National Federation of Clerks of Works and Builders' Foremen's Association was held in Bristol on August 18. Mr. W. Mitchell, of London, presided.

Mr. C. H. Trevelyan, President of the Bristol branch, extended a hearty welcome to the Council.

The Chairman said the Federation was binding together various interests, and he assured them, on behalf of the London Associations, that the greatest sympathy and kindliness prevailed there towards the provincial districts. They were all doing what they could to further the interests of clerks of works and foremen. They must not be too conservative and object to new implements in the building industry. They must keep in touch with all the ramifications of building construction and its allied work. The difficulties in the control of works were not easier to-day than 50 or 20 years ago, but were more exacting with cost keeping and other requirements. With the best impulse and interest they wanted to adapt themselves to modern conditions and make themselves more efficient to their employers. The introduction of reinforced concrete and engineering developments as applied to building kept them on the watch for further developments.

The annual report of the Executive Committee stated that endeavours had again been made to discuss with the London Master Builders the question of a minimum wage, but without avail. As they had not been able to get representation on the Industrial Council of the Building Industry, they made endeavours and were now represented on the Industrial League and Council, a Council of employers and employees established to discuss and promote better relations between employers and employed. Attempts had been made to start Associations at Northampton, Newcastle, and Manchester, to which the Birmingham Association had given much appreciated assistance, and Manchester started an association in February of this year with about 60 members. The Bristol Association made every possible effort to resuscitate the Cardiff Association, and the thanks of the Committee were extended to the Bristol Association for the help they gave in the matter. Membership of the Federation was increasing, the membership now being about 1,030. As they had not been able to stir up the Institute of Builders with regard to having examinations for building foremen, they had appointed a sub-committee to deal with the question and to report as soon as possible.

The report was adopted.

Housing in Belfast.

The Northern Ireland Government having made a grant of nearly £250,000 to liquidate its liability in respect of a portion of the rents under the Belfast housing scheme, the Belfast Corporation on Monday adopted a scheme for the sale of the houses to tenants. The effect of the scheme will be that houses which cost £885, and were being let at weekly rents of 17s., will be sold under the Small Dwellings Act at £450. The weekly repayments, which will include rates and ground rent, will be 15s. a week, or 2s. less than the amount at present paid in rent. The rent of houses let at 22s. will be reduced to 18s. 3d. for weekly repayments.

THE BUILDER

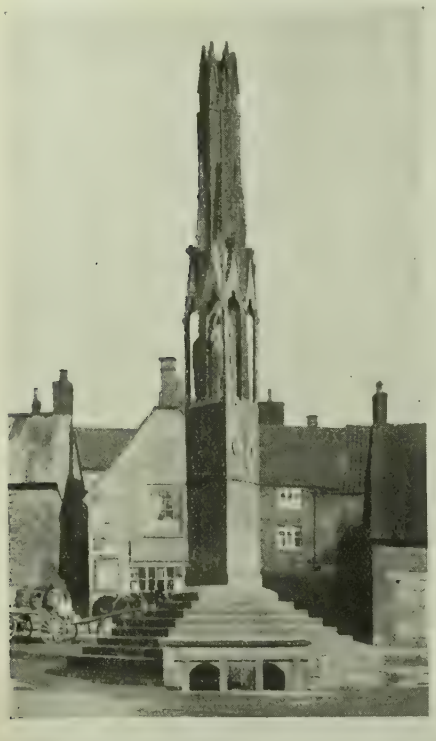
A JOURNAL FOR THE ARCHITECT AND CONSTRUCTOR.

WITH WHICH IS INCORPORATED "THE BRITISH ARCHITECT."

VOL. CXXV—No. 4204. AUGUST 31, 1923

ADVERTISEMENT AND SINCERITY IN ART.

T has been stated somewhere that more money is spent annually throughout the world for publicity, or advertising, than for any other purpose. It is the contention of commerce that it requires publicity, so that its products may be appreciated and taken advantage of by as many as possible. Advertisement writing has at different es been termed an art, a science, and a profession, and it y well be that these claims are sound, especially if the con- tion is that the public must be persuaded into buying some- ng which it does not want. This is obviously an exaggerated nt of view, though it must be admitted that the "effective" ertisement will attract the uncritical buying public. To con- t the hoarding into "the poor man's picture gallery" seems to a subtle and popular method of exploiting an argument based n sophistry. If we must have art on the hoardings, by all ans let it be the best that can possibly be obtained; but we d not assume a virtue of what is not an obvious necessity. is significant that, in many of the fashionable guessing npetitions, we are invited not to indicate the posters we , but what we think is likely to appeal to other people. this pleasant way we combine our appreciation of art with interesting form of intellectual snobbery. All the writing n the artistic value of advertising has not convinced the seholder whose view is obscured by a hoarding covered with way time-tables and notices of property sales. The Prince Wales, in the course of his admirable speech at the Royal demy of Arts, expressed his views in these words: "Decaice in art has always denoted degeneration in the com- nity at large, but health and virility in painting, sculpture, hitecture, music, or literature—health and virility in these are invariably a token that the outlook and ideals of a mmunity are sound." Upon the much debated question of relation of art to commerce he said: "I do not believe one moment that industrialism and artistic development are essarily antagonistic, and that, because a man has keen ness vision, he is artistically blind. On the contrary, I have ays been impressed by the fact that in the business and king community the artistic ideal is very much alive and needs an outlet for its expression." In admitting that ertisements are now recognised as a most necessary adjunct he business side of life, he considered that many a man had never given pictures a thought had had his interest hem stimulated by a casual study of a poster. No doubt e is a great deal of truth in this, but it is beyond all doubt the ideal community would ensure that industry as a whole rved the æsthetic refinements which affect the social welfare country. It is a cause for complaint that the art which is ned to the hoarding exists primarily for the disposal of s. There is nothing wrong in this, but it is significant all the art should be concentrated upon the selling depart- t of industrialism, where the rewards are apparently so ous.



n our opinion, there is a simple test which can be applied e commercial "picture gallery," which would settle some e theories held upon art. The suggestion is that manu- rers should exhibit on the hoardings a photograph of their ries and surroundings, along with their claims for the y and health-giving properties of their commodities. It least a more sensible idea than the pretence that a portrait actress has any relevant connection with either the com- ty or the propagation of fine art. We might then safely it to the public to form its own judgment, though ear the reply of the sceptic, that there are some things h do not depend upon common sense. There are numerous ts for improvement if we are in the mind to be sincere in expressions upon art; the factories and workshops, the s, the desolate waste heaps, and the smoke and grime, ardly manifestations of a healthy community with ad- ed ideas upon art and the artistic development of industrial art. We cannot see that we are far on the way when we blacken our Northern industrial areas to produce the goods, and pretend we can brighten the streets of our cities by helping to sell the goods. It seems an unfortunate form of compromise, but, even if we make a distinction between manufacturing and selling, what is there to be said for the stream of unsightly advertisements running from the factory to the city and following us to the sea-side? We read with pleasure in a daily paper a few days ago that Lancashire has taken a definite stand in the matter, "and is taking steps to clear away the hoardings disfiguring the landscape in the Lancashire part of the Lake district."

It would appear that a healthy civilisation must in the end rely upon preventative measures, rather than place too much faith upon the sense of fitness and decency possessed by the average individual with freedom to think entirely on commercial lines. The "universally expressed wish of the great mass of the British public" does not tend towards a sense of real beauty and dignity; the dislike of ugliness and the inability to obtain beauty is not an excuse which can be defended. The national artistic sense can not only be measured by the steps it takes to prohibit what is ugly and harmful; it is also the measure of civilisation. There should be great possibilities in the future if architects turned their attention to the designing of factories and workshops, or perhaps it would be more correct to say, if they were given the opportunity to develop their ideas. Mechanical equipment, routine process work, and mass production belong to the province of the works manager and the engineer, but we cannot believe that the ideal factory can be evolved if we regard it as a mere building surrounding the machinery and plant set out on an engineer's blue-print. During the last year or two we have seen the publication of numerous books upon every phase of industrialism, ranging from economics to the scientific management of works. This is all to the good, but it is significant that the emphasis is invariably upon the physical well-being of the worker, leaving the outward appearance of things, apparently, to come under the heading of equipment. It is easy to write in vague terms about ideals in industry, but industrialism has its obligations, and we maintain that the outward manifestation of industrialism is something definite, and requires consideration from an ethical standpoint. Welfare work is now thoroughly established; canteens, rest and club rooms, ambulance, labour, and administration departments, ablution and changing rooms, are only a few of the factors which will form an essential part of the factory of the future. They will affect the general disposition and planning of the buildings, and suggest great scope for an imaginative architectural treatment. We have suffered much in the past from the bare bones of construction, the meretricious ornament, the sham turrets, and the affectation which attempts to disguise the factory. It is not paradoxical to say that the worst failures are those which do not look like factories. Factories will develop their own expression if they rely for their effect upon a straightforward expression of their structure and purpose, skilful grouping of masses, and carefully studied proportions of windows and general details. We believe that a fraction of the money spent on advertising in public places would materially help to soften the raw edges of the industrialism which we can see on the landscape of any manufacturing district. The sceptic tells us that beauty will come when it can be shown that it will pay and not till then, and that meantime the profits from advertising can be calculated to a decimal. The effective reply is that there are handsome returns in health and happiness which cannot be entered up in the cash book, and that virtue is its own reward. We are not arguing on the assumption that the essence of advertising is the misrepresentation of the quality of the goods; on the contrary, we merely say that it is a nice problem for the philosopher to work out our rewards and punishments, and ascertain what is the greatest service the manufacturer can render to a community.

NOTES.

Old Buildings in Oxford.

So much has vanished from Oxford that was precious both for its architectural and historic value; so much has taken its place that is not precious in any way at all, that we are glad to see attention called to the danger of any further mutilation or removal of its ancient buildings. And it is not only their destruction but the defacing of them in different ways that we have to deplore—ways such as filling them with modern windows and plastering the walls with advertisements. As stated in the *Times*, "The old houses in the Cornmarket have been fitted with modern windows and the sides of one disfigured with huge, ugly trade announcements." At a meeting of the Oxford Architectural and Historical Society, Mr. F. Madden, a past-president of the Society, said that "he and many others in Oxford agreed that attention should be drawn to these few remaining old houses of beauty and interest." We think, however, the tide is turning against the destruction which has already taken place not only in Oxford but throughout the country, and that a healthier growth of public opinion begins to see that there are other beside commercial interests which it is a claim on our citizenship to revere. We hope that the Oxford Architectural and Historical Society will use its best influence to prevent further destruction or injudicious renovations to these old buildings.

Geddington Cross.
(*See p.* 320.)

Village Signs.

Some three years ago there was an outburst of enthusiasm for the revival of the village sign, the idea having been initiated by the Duke of York at a Royal Academy banquet. Although the movement took on at the time, it seems unfortunately to have somewhat petered out. Nothing could so easily add to the interest of our villages as the reintroduction of the sign on a large scale, and we hope those locally interested in the brightening of village life will not overlook the merits of so simple and effective a measure. As we passed through many villages the other day on a long motor journey we felt strongly the need for some name identification of the villages through which we passed. The sign-post should provide this and so provide an added interest to road travel.

Oundle Church, South Porch.

St. James's Park.

After some six years of desolation London's most beautiful park is at last being restored to its inhabitants. The water is slowly refilling the lake, and the Government buildings that at one time covered its bed and overflowed into the Park on all sides, have finally vanished. In that neighbourhood there now remains, as a war legacy, only the monstrous weather-boarded erection on the Admiralty roof, and we hope that this will soon accompany the St. James's Park war buildings into the land of memories.

London's Traffic.

It looks almost as if the patient Londoner is about to turn upon those who are indirectly responsible for the chaos that reigns in the streets on all hands. Roads seem to be pulled up in the manner best calculated to render worse our already congested thoroughfares. But quite apart from the necessity of organising road repairs and avoiding needlessly tearing up the surfaces of t streets, conditions in the more crowde centres are rapidly becoming unbearabl the Mansion House, Ludgate Circus, a the Strand approach to Waterloo Brid are nuclei, at least one of which can guaranteed to cause ten minutes' dela to anyone travelling from the Bank Charing Cross. The present state affairs cannot be allowed to continue, a the public will, we hope, insist upon t institution of some central controllin body, one that could regulate the kind traffic allowed during crowded hours a who could employ some kind of orga sation and foresight where none exi at present.

Lead Urn, Drayton.

Road Hogs.

The outcry against Londo chaotic traffic coincides wi public indignation agai the toll of life that is co monly being exacted by thoughtle foolish and incompetent motorists. may well be that 95 per cent. of th using the roads are capable and care drivers, but a very small proportion of other kind is sufficient to constitute menace to public safety. It is legitimate for a motorist to claim that does not constitute a danger if peo behave sensibly. He ought to know t pedestrians often do not behave m sensibly than children, and he must le that their stupidity is not a suffici excuse for running them down. Accid are, of course, inevitable, but they ar much more frequent occurrence than t should be.

Size and Content.

With the number of l buildings recently built, in course of erection, at tion is likely to be dive from other qualities more intrinsic t size as an end in itself. Size is a qua an added dignity when seen in relatio

ent, but mere size in a building ld make no claim upon us. One ding is not better than another be- e it is larger, and proportions deter- e beauty more than scale. Yet it is oming customary to seize upon com- ations of size in denoting the claims building upon us, so we find a con- porary making use of headlines to mpany an article on a well-known ding, as follows: "Our greatest rch" . . . "Half as large again as St. l's," and so on. Our purpose is not nter into the merits of the building oted in these phrases, but to deprecate over-insistence of certain aspects to neglect of others much more impor- , and which dazzle only to obscure e certain and fundamental issues. lity—not extent—is the most im- ant, and mere size without the accom- iment of more intimate characteristics ften the poorest architecture. At the ent moment, when the contribution ision and vital craftsmanship is often ing in architecture, our larger buildings ain the poorer for the absence of this e corporate enrichment; the vision of single mind is not sufficient in itself. y when a building is fitted with a ificance commensurate with its scale it appeal to us by its greatness, and is no alternative to this require- t. Whether at Chartres or Amiens see the due proportion of significance vision expressing itself over the le, and this relation between extent content charges such buildings with ighty significance. Otherwise man is planted by materials, and size be- es not only a superstition but a strosity. We are inclined to ask t justifies such scale when we see e expansion without expression, when objects appear to be rents or mer- dise only, and architecture is made e only as a cloak to our avarice. We ot unite the real issues of beauty, and architecture includes more corporate ession it will retain the inevitable rty of the single mind.

---

vention Fogs.

The report of the Public Control Committee, which has been presented to the London County Council, the increased use of electricity and or power, and at the same time gives ulars of four main causes of smoke ion, such as domestic chimneys, trial operations, railway locomotives, steam vessels. The opinion is ex- d that the question of smoke nuis- is one of great importance, not only ecting the health of the population, ecause of the destructive character action. It is also suggested that ng enactments should be revised odified in one self-contained statute, at at an early date the Government should undertake legislation to deal with the matter. We are glad to see in this evidence of the growth of public opinion on a matter so much affecting the national life. No one acquainted with city life, especially in industrial areas, can be regardless of the waste in health and wealth which the continuance of the smoke nuisance implies, and we welcome the proposal for Government action. In the past a difficulty has lain in the apathy of people; but that, happily, now no longer exists, and there is a healthy growth of civic feeling towards purifying our cities and making them more what they should be.

The Bank Rate.

The recent rise in the Bank rate from 3 to 4 per cent. is, we are told, primarily due to the continued depreciation of the pound sterling, which has fallen from over 4.72 to under 4.56 to the dollar in less than five months. Apparently, the Bank of England is afraid of the pound slipping too far away from the dollar and, presumably, the intention is to try to check the fall by raising the rate of discount. International adjustments of this nature may not mean anything to the average person; the only questions which concern him are to what extent the Bank rate affects industry, and the income he derives from industry. He is likely to remain indifferent when he reads that the experts do not agree on the matter. The theory that a low Bank rate has enabled business firms to borrow more cheaply than they otherwise would hardly seems to us to be a sound argument, when we consider that firms which are financially sound generally find they have too much money at their disposal when trade is bad. When trade is good their money is being used in manufacturing and in purchasing stock and in developing their buildings. There are invariably two sides to these problems, and if there is a fear that the raising of the Bank rate will accentuate the fall in prices we would point out that financial experts are unable to agree on the subtle question of whether the Bank rate controls the state of trade, or whether it is merely a reflex of the state of trade. In recent times we have proved that trade can thrive on a very high Bank rate, so that there seems little need to worry about any theories which we do not understand. We can all discuss in definite language certain matters which admit of no argument, but it is very evident that the connection of the Bank rate with our personal affairs is likely to remain obscure.

"The Inconsolable." Lorenzo Barlonini, Sculptor.

GENERAL NEWS.

Professional Announcements.

Mr. C. E. Hanscomb, A.R.I.B.A., architect and surveyor, has opened an office at Station-approach, Sanderstead, Surrey. (Telephone, Purley 1151.)

Mr. Richard Byrom, A.R.I.B.A., architect and surveyor, has commenced practice at 9, Victoria Buildings, Silver-street, Bury, Lancs., and would be pleased to receive manufacturers' catalogues and samples for filing purposes.

St. John's Church, Southall, War Memorial.

Messrs. John Daymond & Son, Ltd., Westminster, executed the war memorial at St. John's Church, Southall, illustrated on p. 278 of our issue for August 24.

Appointments.

The Boston District Council has appointed Mr. A. Barton to the position of Surveyor at a salary of £500 per annum.

Mr. Joseph Draper, late Surveyor to Thornaby-on-Tees District Council, has been appointed Surveyor to Bognor Town Council, and takes up his new duties on October 1.

Obituary.

Mr. Charles Steward Smith, J.P., F.R.I.B.A., of Reading, died on Sunday, after an operation. Mr. Smith, who was born in 1858, was the eldest son of the late Mr. Charles Smith, J.P., F.R.I.B.A., of Reading, a well-known local architect and surveyor, and twice mayor of the borough, and as an architect carried on busine first with his father and afterwards with h father and Mr. Harry Hutt, A.R.I.B.A., und the style of Charles Smith & Son.

Mr. George Yates Mills, architect, of Derb who died at the residence of his son-in-la Capt. Kendal, of the Surrey Docks, Londo was many years ago on the architectural st of the Midland Railway, but left to commen business upon his own account. Mr. Mills w the architect for many large local buildin and for Nestlé's Ashbourne and Tutbu factories.

The New Housing Scheme.

Several housing matters came before t Coventry City Council last week. The Housi Committee reported having discussed wi representatives of the Building Trades Employe Association various matters connected wi the erection of houses under the Act of 19 and recommended the Council to suppleme the Government assistance (equivalent to £ per house) by a further grant of £25, making total of £100 per house, subject to compliar with the approved conditions. The committ further reported it was not prepared to take ov unsold subsidised houses, and that the decisi not to assist houses erected outside the c be adhered to. The houses to be qualified assistance would be (1) two-story cotta (an attic permitted in addition), (2) one-st cottages or bungalows, (3) houses built in fla each flat being self-contained and treated one house, the superficial area to be: Tw story cottage, minimum 620 superficial fe maximum 950; one-story cottage, bungal or flat, minimum 550, maximum 880. Th minimum measurements might, for a limit number of houses, be reduced in the case o two-story house to 570 super. ft., and of a f or one-story house to 500 super. ft. The Cou gave unanimous consent to the recommen tions.

Architectural Association Schools Students' Work.

Design for a Campanile. By Mr. R. C. Erith (Second-year Student) (*See p.* 323).

COMPETITION NEW

Bergen.

The result of the competition organised the municipality at Bergen in connection w the building of a new bridge over the Nygaar strommen is as follows:—First prize (Kr. 10.0 —Dr. Moritz Ritter, engineer, of Budape second prize (Kr. 8.000)—Engineers: F. Seln of Christiania and the Harkort Co., Duisbu architects, L. W. Wilhelmsen & Crawfo Jensen, Christiania; third prize (Kr. 6.00 A–S Stoltz Rothing & Co., Bergen, and Harkort Co., Duisburg.

Manchester.

Messrs. The D.I.C. House (Cross-street), I of 16, John Dalton-street, Manchester, h invited a certain number of architects to sul designs for a new building in Cross-st Professor C. H. Reilly, F.R.I.B.A., is assessor.

Coatbridge.

Designs for a war memorial in West End P (See advertisement this week.)

Other Competitions.

**Other competitions still open include following (the dates given are, first the send in date, and second the issue of *The Build* which full particulars were given):—Singe College (Jan. 1, 1924; March 30). Hull Gallery (Nov. 5; May 4). Mint compet for plaques (Sept. 30; May 25). Birmin Masonic Temple (Sept. 12; June 22). C scheme (Sept. 30; June 29). Memorials t Missing (Jan. 1, 1924; Aug. 3). W Infirmary (*Banned by R.I.B.A.*) Halifax out—*Banned by R.I.B.A.* (Oct. 1). Sw Masonic Hall (Oct. 3). Eastleigh and Bi stoke Assembly Hall (Aug. 24). Chi Lay-out—*Banned by R.I.B.A.* (Oct. Aug. 24).

THE ASEPTIC HOME.

By NORA ROBERTSON.

The model home is becoming a cult. Few of us can hear it described without first experiencing a sense of guilt at the inadequacy of our own appointments, followed, if we have any spirit, by reaction and rebellion against its tyrannies. For, after all, who wants to live in a model home? And, indeed, can it be called a home at all, or is it anything in its chilly, hygienic self-consciousness but a model interior, the freak of didactic lecturers, generally well-informed ladies, who profess a monopoly as to what women want?

Armed with an order to view, let us go over one of these ideal maisonnettes in Spain. The philosophy co-relating the several parts is based upon the Idea of dirtphobia and the Will to fittings. It is also immoral to accumulate. The bedroom contains a bed, otherwise it has no furniture, and, in its awful pristine cleanliness so closely resembles a public lavatory that one would unconsciously leave a tip after washing in the laid-on basin. The various cupboards are fixtures, aggressively so; the dressing table, also a fixture, slides in or pulls out when required; boots are tightly parked in a boot locker concealed under a window seat, itself "inexpensively improvised by the village carpenter." The floor is bare and polished, carpets, of course, being taboo. The angles are rounded. The door surface is flush. There is no fireplace (really model homes are communally heated). The radiator is painted white, so is the pull-out table; the walls are distempered white; in fact, everything is white except the sheets, which are crude coloured checks "to break the insipid monotony of tradition."

Next door is the nursery. The nursery is peculiarly holy in the model home, and the details must be familiar to any visitor of recent exhibitions, where the charming notions of our young princesses are interpreted by enterprising tradesmen. Everything is the right height. There is an art frieze, no wall paper, no pictures, no corners, no microbes, and no character. We carry away the impression of acres of cork carpet, and a round table with a bowl of roses. The nursery we remember best had nothing model about it; it was a shameless hotch-potch, and it had a patterned carpet, invaluable to a generation that played marbles, a scrap screen, a solid square table, with an ink-stained chenille cloth with coloured bobbles, and enthroned on the table the family sewing machine. The place may have been full of microbes, but good ones no doubt were included.

The model bath-room is altogether satisfactory, so much so that we deplore the day when it in turn must be supplanted by the adjustable human nozzle, "so readily affixed to the electric vacuum cleaner."

We will not dwell in the sitting-rooms; they are ingenious; nearly every article of a few pieces of furniture can do three or four other things besides the one to which we are accustomed, and the scheme is never quite without colour or jazzingly full of it. Instead, let us hurry on, and, reverently removing our shoes, explore the kitchen. Here it is that the philosophy of dirtphobia achieves its logical triumph. Everything gleams with the high light of spotless virtue. Food in its crude state, or a cook, would be an anachronism. Note the absence of the familiar centre table; instead, there is "space" and a side pull-out. There are no beloved drawers containing hatpins, "Mrs. Beeton," and the screw of the mincing machine; in their place are glazed dust-proof shelves behind which are paraded the aluminium non-drip teapot, the hay box, mysterious chafing pans, and the other burnished surgical implements of refined no-handed cookery. Awed by the experience of our visit we return home and contemplate.

In theory, every feature of these carefully devised houses is logical, perfect and admirable, but the reiteration makes the sum of their achievement irritating to the ordinary, illogical human. For, even after making every allowance for the service difficulty, is there an immediate necessity to Americanise the details of our surroundings? Home to us here still means accumulations, generally traditional ones; it means compromise, it expresses the varying tastes, hobbies and moods of a family, and it cannot do all this and remain surgically clean. Probably the present aseptic house frenzy is a reaction from the fussy war of exhaustion which so many English housewives unsuccessfully wage against perfectly inoffensive dust.

If but an iota of that zeal were used to reinforce the campaign against the vile dirt of smoke pollution the gain to society would be immeasurably great and hours of energy would be saved. Let us preserve our homes as inherited, evolving them reasonably as the need arises. They are institutions that cannot be remodelled nearer to the heart's desire by the process of first being scattered to bits, and if, in defending their charm, we fail to keep them up as perfectly as we used, then let them rest a little dirty. The present writer, not being indigenous to this island, had never even heard of a spring-cleaning, much less submitted to one, until she left her own adjacent island. It may be unfortunately true that the matrons of England are not to be led so agreeably astray, and, after all, they have their reward; but the cleanliness that is next to godliness is a superfluous virtue in the other island that is claimed by the Saints, and where among its many mansions the model home finds no place.

Birmingham Archæological Society.

A two-day excursion to Kettering and neighbourhood was held last week by the Birmingham Archæological Society with an abundance of interest. Among the places visited were the Rothwell Holy Trinity Church, of Norman architecture, where there is a crypt said to have been used as a charnel-house containing the bones of some 4,000 persons, and Boughton House, the residence of the Duke of Buccleuch. The villages of Geddington, Brigstock and Lowick were visited, and at the latter the party were conducted over Drayton House, the home of Colonel Stopford Sackville, one of the oldest and most interesting houses in the country. It was built in the reign of Edward I. At Geddington, the Queen's Cross, built in 1290, in the reign of Queen Eleanor, was visited.

CORRESPONDENCE.

[While we are glad to publish letters on professional and other matters of interest to our readers, it must be understood that we do not necessarily endorse the remarks of correspondents, who will oblige us if they will express their views as briefly as possible.]

Competitions.

Sir,—The recent correspondence in your columns on the subject of competitions has raised a further thought in my mind which may possibly be worthy of consideration. The point is: Do we not, as a rule, make our competition drawings far too elaborate, and could we not, by the process of general agreement, reduce much of this elaboration and so cut out a great deal of unnecessary work and expense without loss of efficiency? Of course, one realises that if architectural drawings are to be judged by amateurs, it is indeed probable that the design which would result in the best building may be rejected in favour of one more elaborately presented.

But, when designs are examined by experts, surely we may assume that the object of the assessors is to think in terms of the ultimate building, and they can do this quite well with far simpler drawings than those usually submitted. Lest there be any misunderstanding, I will say definitely that I do not desire to encourage bad draughtsmanship or to discourage good draughtsmanship for competitions; but rather to suggest that less elaborate sets of drawings, well expressed by good, clear, and simple draughtsmanship, are all that expert assessors need in order that they may decide from which set the best building is most likely to emerge.

A general agreement on this point, together with the adoption of the jury system, might well result in competitions being far more popular than they are at the present time. What is more important is that this combination would probably also result in sheer design triumphing even more frequently than at present over the meretricious.

W. S. Purchon.

Cardiff.

City of Hull Cenotaph.

Sir,—Apropos the correspondence in *The Builder* on architectural competitions, I give below a few points of bad organisation in connection with the above competition:

(1) The advertisement calling for designs appeared in *The Builder* for June 22 and stated that conditions, &c., would be available after June 18. (2) Although I made early application for the conditions, I did not receive these particulars until July 9. (3) The printed conditions stated that questions from competitors could not be entertained after July 2, and any such questions, with replies, would be circulated to competitors and form part of the competition. In my position, what chance had I to ask questions? Whether "Questions and Replies" were circulated I do not know; I did not receive a copy. (4) The printed conditions gave the sending-in date as July 25, but although one casually noticed in *The Builder* for July 20 that the sending-in date was given as July 31 one rather took it, seeing that no direct communication as to extension of date had been sent by the promoters to competitors, that this was a misprint. I sent my design off to reach Hull by July 25, on which day I was greatly annoyed to receive a postcard informing me that the closing date had been extended to July 31. Under this point surely the proper course to have taken would have been to inform individual competitors direct.

THE NENE VALLEY.

By G. NORBURN.

Few districts offer greater "riches in a little room" to the architectural holiday-maker than the Nene Valley, from the Saxon work of Earl's Barton and Brigstock to the work of John Webb at Thorpe, and the charming restoration work at Oundle.

Kettering is an excellent centre of a good district; though itself robbed of much of its interest by very necessary street widenings, it still shows us a splendid church with a notable tower and spire. At Rothwell, four miles away, is the interesting Market House, begun in 1577 and left unfinished by that Sir Thomas Tresham whose son was implicated in the Gunpowder Plot. The detail exhibits grace and refinement, and is much akin to his other unfinished Lyveden New "Bield," ten miles away. This Sir Thomas was a keen builder, but, being also a staunch Roman Catholic, had to suffer fines and imprisonment for his opinions, which prevented his projects from attaining fruition. His only finished work which has come down to us is the peculiar triangular Lodge at Rushton, standing in a remote corner of the grounds of Rushton Hall. Its solitude, coarse detail, and uncommon shape at first repel, but, trying to pierce through to the motive in the mind of the builder, one remembers that it was built as an emblem of the Trinity, notes the play of triangle, trefoil and triple gable, and realises that it remains as one of the quaintest of the "quaint conceits" of the Elizabethan age.

Three miles or so from Rushton, set among those splendid elm avenues planted over 200 years ago by the eccentric Duke of Montague, is the village of Geddington, chiefly famous for its cross, which I certainly think is one of the most beautiful mediæval monuments left to us. It is triangular in plan and set on a hexagonal base of steps; the lower part is covered with diaper work, which, being on a slightly waving surface, is delightful in effect.

Montague Almshouse: Central Feature.

Above, a statue stands on each side in a niche with canopy over, and this is carried up to the summit, and works out in a very fine and logical manner.

Between Geddington and Kettering is the village of Weekley, where, shyly tucked away near the church, is the Montague Almshouses or Hospital, presenting that simple grouping of window, gable and chimney so endearing to English eyes. Over the doorway a sundial is painted in dull red with a black border, which has faded during the years to an unobtrusive hue, yet still gives a pretty spot of colour; the date, 1611, is also painted on in black. The gates opposite lead to the park of Boughton House, which has an interesting wing built in a French manner by one of the Dukes of Montague, who was Ambassador to France in late Stuart times. He and his kin are buried in the adjacent church of Warkton under monuments in the full-blown manner of the eighteenth century, about whose artistic value there may be two opinions.

Six miles from Kettering and two from Thrapston, in a secluded hollow, stands Drayton House, over which Horace Walpole was justifiably enthusiastic, and which has among its many treasures a wealth of wrought ironwork and lead work, and a seventeenth-century parterre, with fountain, vases, and banqueting houses at two corners. "Just," says Walpole, "as Sir John Germain brought it from Holland." What we see now of the exterior is mainly Elizabethan, the mediæval house having been largely added to about 1584. The fine, almost Baroque, façade and colonnade to the courtyard were built about 1700 by Sir John Germain, the reputed half-brother to William III. Notable features of the interior are the dining-room, a gem of Adam decoration in soft colour with an excellent mantelpiece by the same hand; the ample walnut, winding staircase cantilevered from the wall, is a masterpiece of carpentry, and leads to the long gallery, now a library from which one can get an excellent view of the parterre below. The fireplace in the King's Bedroom is by Webb, and his original drawing for it still exists, showing that his mantelpiece surround has been largely removed, leaving the upper part rather unrelated to the lower, though the bold swags on each side of the shield are intact.

Webb left a drawing for another fireplace at Drayton, which seems never to have been carried out, and his direct connection with Drayton ends here, though I cannot help thinking that he may have had a hand in the designing of the north door to the garden There is strong evidence that Sir J. Germain employed Tijou for the wrought ironwork, of which there is such an amplitude. This may help the resemblance to Hampton Court which he was accused of striving for. The stone staircase, with its wrought iron balustrade and balcony, is unusually fine, as is that to the outside stairs leading into the garden. The lead work, vases, statues and the magnificent rain-water head owe their presence largely to Germain's second wife, Lady Betty, to whom (strong-minded lady) our thanks are due for resisting the fashions of the landscape school and preserving to us the garden in its original form. But we must leave Drayton and pass on, having already lingered too long in this

aunt of beauty so typically English in itself nd in its charming and enthusiastic owner.

Oundle, a quiet stone-built town, is be-oming quite collegiate in atmosphere, with he buildings of its school spreading serenely bout it. The church is famous for its spire nd tower, and has a good south porch. The Talbot Inn (1626) and the White Lion Inn 1641) have fronts of the interesting and satis-actory traditional type, which lingered on so ong in the stone districts. The former has fine oak stair reputed to have come from Fotheringhay Castle, and which has a strong amily resemblance in detail to that of Lyve-en Old "Bield," the family home of the Treshams, three miles away. In the dining-oom, now occupying the whole of the first-oor front, are some interesting sixteenth-cen-ury fireplaces. Romance also attaches to he window now lighting the staircase, which ame from the great hall of Fotheringhay astle, and which must have looked down pon the trial and execution of the unfortu-ate Queen of Scots. Among later work is boldly-designed house on the south side of he square, and nearly opposite a row of shops, busually treated, with a colonnade on the round floor and houses over, the gables finish-g off with a large edition of the typical orthamptonshire chimney. This colonnade ay have been inspired by or have had some nnection with the Market House still stand-

Thorpe Hall: South Front.

ing, and which was, as usual, open on the ground floor.

Four or five miles further on lies the village of Fotheringhay. The Castle, once a Royal fortress, is only now marked by a few mounds. The fine Perpendicular church must have had one of the best proportioned interiors in England before the chancel was destroyed. It was attached originally to a college refounded by Edward IV, and still retains the fine oak pulpit presented by him, though the benches of the choir are now in various churches in the country round. Travelling on towards Peterborough, we cross the Great North Road at Wansford, with its delightful old bridge over the Nene, and the old Haycock Inn at its southern end, no longer an inn, but still a delight to the eye as a vigorous piece of design.

What little is left of old Peterborough has been so thoroughly described that I will pass on to Thorpe Hall, lying between Peterborough and Castor. It was built by John Webb about 1656 for Oliver St. John, Lord Chancellor during the Commonwealth, whose badge crowns the north and south gate piers. The house, outside and in, may almost be termed an epitome of Webb, and is, singularly, as he must have left it. It exhibits the tricks he loved, the returned and mitred architrave, and the scroll volute, certain reminiscences of Jacobean tradition. The interior is almost more interesting than the exterior.

Thorpe Hall: Office Wing

Built of Ketton stone, which has weathered to beautiful tones, the outside may be described as handsome, having much of that masculinity that distinguished the work of Inigo Jones. The chimneys are a very striking feature, being large, boldly rusticated, and richly capped. Those on the stables are equally striking, and enhance the grace and lightness of the bell cupola. The doorway in the wall of the yard is an interesting version of such a subject, but the smallness of the keystone is an undoubted defect. That all this is by the same hand can be seen by comparing the centre feature of the office buildings with the façade of the gazebo. This appears from a plan made by Hakewell about 1850 to have been the centre feature of a range of buildings now gone, this part having been rebuilt on much the same axis, but further forward, and, though it suffers from its very incompleteness, it is still a characteristic and beautiful piece of design. The treatment of the pilaster caps with their trusses carrying the cornice over is decidedly bold and original.

The iron balustrade of the south porch is most interesting as a transition between the crude cut work of the Jacobean smith and the more dexterous wrought work of the Restoration. The design is complicated and flowing, but, cut from sheet metal, giving an unusual effect, one expects the depth of wrought iron and sees only the flatness of sheet. The ironwork of the gates appears to be later, and is not up to the standard of the noble gate piers, which attain much character and vigour by the unusually large bed mould to their cornice. Thorpe, though comparatively small, is an excellent example of the phase of an architecture which was due to Inigo Jones and untouched as yet by the genius of Wren. One finds Webb at his best and comparatively free from the heavy touch which often prevents his work from attaining greatness.

Below Peterborough the course of the Nene lies through the Fens, and the interesting stone district ceases, making it a very good point to break away and cross into the Welland valley to the ever-fascinating Stamford.

Normal Training College, Peshawar.

This building has recently been completed, and is situated about three miles outside Peshawar on the road leading to the Khyber Pass into Afghanistan. Building operations were commenced in 1919, but owing to the Afghan War work was suspended, as the materials collected were taken for war works on the Indian frontier. The college has been erected from funds provided by Government, and is intended as a training centre for teachers at the various Government schools in the North-West Frontier Province.

The accommodation comprises, in the main building, eight class rooms, Principal's office, clerks' office, common room and library. An assembly hall is arranged in the quadrangle at the back of the main block. Living quarters are provided for 124 Indian students in two wings, with separate dining rooms and kitchens for Mohamedan and Hindu students respectively.

The building has been designed in a simplified form of Mogul architecture. The main walls are built of bricks manufactured locally. The floors and roof are constructed of reinforced brickwork slabs supported on reinforced concrete beams. The total cost of the building amounted to Rs. 23,000 (£21,533).

Mr. B. Matthews, F.R.I.B.A., Consulting Architect for Military Works in India, was the architect for the work, which was constructed under the supervision of Capt. F. S. de V. Gould, M.I.C.E., Mr. L. W. Phips, A.M.I.C.E., and Mr. A. O. Morrison.

British Officers' Hostel, Peshawar.

This building has, owing to the shortage of bungalows, been erected by the Government for the housing of British officers and families whilst stationed for duty in Peshawar.

The accommodation consists of sixteen unit suites, comprising sitting and bedroom, dressing room and bathroom. Single officers occupy one-unit suite and married officers two or more unit suites according to size of family.

The permanent dining and drawing rooms are now under construction, also an additional block of quarters similar to that illustrated. At present this accommodation is provided temporarily in tents.

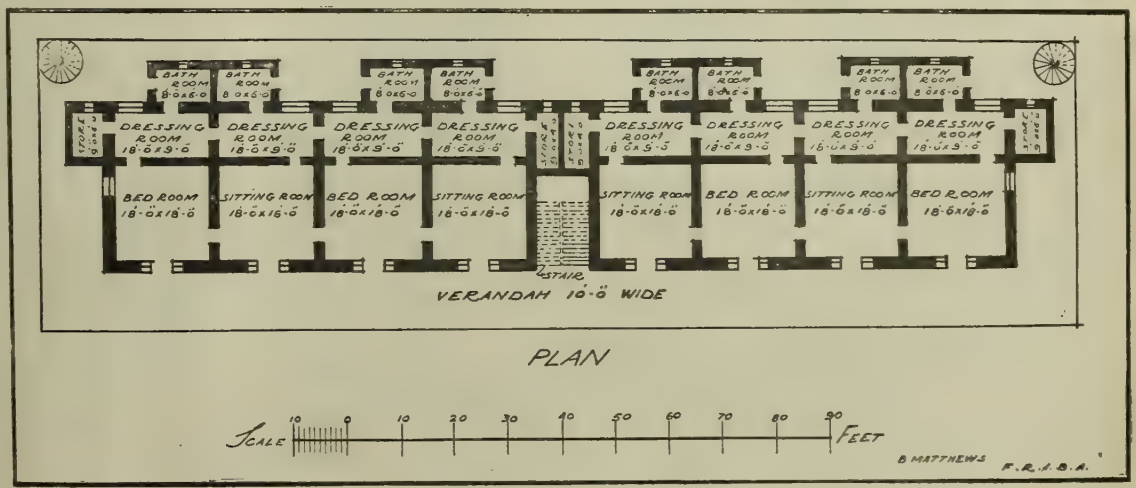
All main walls are constructed of bricks manufactured at Government kilns in Peshawar. The roofs are formed of reinforced brickwork, which consists of steel bars placed between the courses of bricks. A light corrugated iron roof has been erected over the flat roof to protect the main roof from the excessive heat of the sun during the hot weather.

A special feature of the design are the hinged louvres in the verandahs. During the cold season these can be opened to admit the maximum amount of light, and during the hot weather they remain closed to protect the main walls of the building from the direct rays of the sun.

The cost of the building amounted to Rs. 1,30,000 (£8,666). The rent of each unit suite, including furniture and electric light installation, works out to Rs. 45 (£3) per month.

The building was carried out under the supervision of Colonel H. A. D. Fraser, R.E., and Capt. F. S. de V. Gould, from plans prepared by Mr. B. Matthews, F.R.I.B.A., Consulting Architect for Military Works in India.

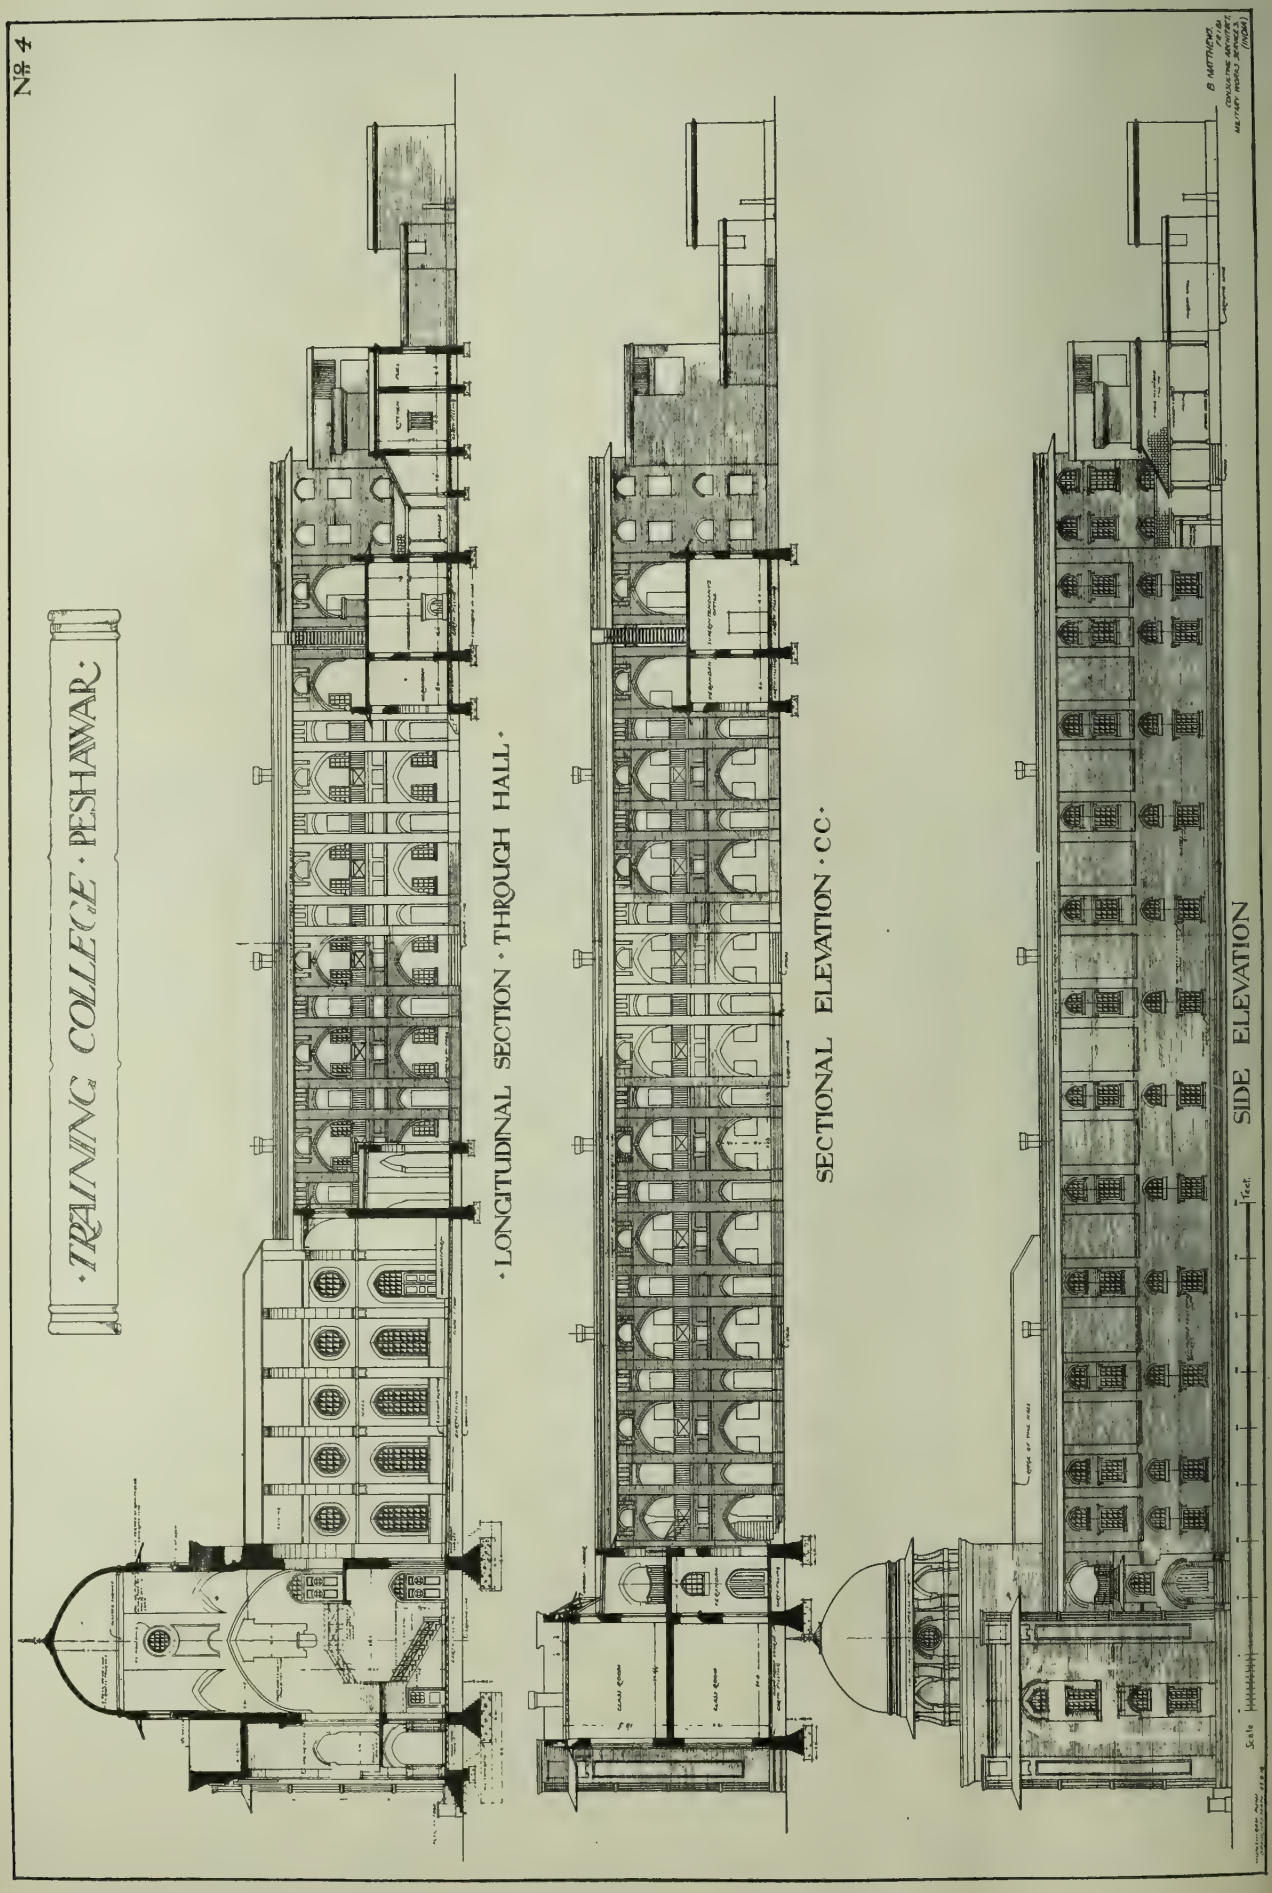
Students' Work of the Architectural Association.



We illustrate this week drawings of the various years of the Architectural Association Schools—an article describing the exhibition, at 34, Bedford-square, appeared in our issue for August 3.

The drawings show the results of the A.A. teaching, which endeavours to avoid any straining after preconceived ideas, and to lead to a natural and unmannered architectural expression.

Southwark Cathedral.



An appeal is to be made for a fund to meet the cost of the renovation of Southwark Cathedral. Canon Haldane, the Precentor, informed a Press representative that the condition of the fabric was causing considerable anxiety to the chapter of the cathedral. A scheme for the renovation of the Gower tomb, erected to the memory of England's first great poet at a cost of about £300, was also being considered, but unfortunately the cathedral authorities had no funds at their disposal for the purpose. The advice of a well-known architect had been obtained as to the condition of the whole of the fabric, and the Bishop of Southwark and the members of the chapter were considering his report.

No. 39, Circus Road, St. John's Wood. MESSRS. BENNETT & HOSSACK, Architects

[This is an early nineteenth-century house in stucco with a characteristic verandah and trellis. It was added to some few years ago, and in this latest work three extra bedrooms and a loggia, a lounge, and a circular bay window are to be added. An effort has been made to keep the simple lines, which are part of the character of houses of this period, and to make an addition which would give a good plan as well as provide the extra accommodation. The work will be carried out in stucco and tiles for the elevation and with brick paving for the loggia, while the remaining materials will as far as possible match the existing. The builders will be Messrs. John Marsland & Sons, Ltd., of South Molton-street].

THE DOME: ITS HISTORY AND CONSTRUCTION.—II.

By SIDNEY TOY, F.S.A.

With the transference of the seat of the Empire from Rome to Constantinople the problems of building peculiar to the Levant were assailed with greater zeal, and a renewed vigour was infused into architectural development. The Levant is subject to frequent earthquake shocks and is not well provided with timber. Confronted with these difficulties the Byzantine builders selected the dome as the principal form of covering for their churches, and devised an ingenious method of construction with thin bricks and thick bed-joints so that in building it they were able to dispense almost entirely with timber centering.

The bricks used by the Byzantines varied from 1 ft. 2 in. square to 2 ft. 3 in. by 1 ft. 4 in., and were from 1¾ in. to 2 in. thick; they were laid between mortar joints from 1 in. to 2 in. thick. In the construction of their domes the bricks were laid in successive conical rings with beds converging towards a centre on the axis of the dome, this centre gradually rising as the rings approach the crown, as shown in Fig. 5. As each ring was set a thick bed of mortar was spread upon it and the bricks of the following ring were placed upon this bed, the adhesive quality of the mortar in bed and side joints being sufficient to hold them in position until the ring was formed. When complete the ring became a kind of conical key, its bricks receiving mutual support, as shown in Fig. 6, and no timber centering would be required.

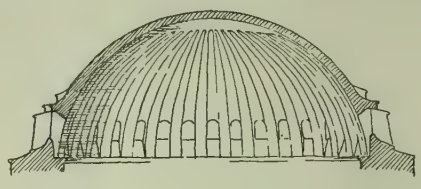

Fig 9

Fig 10

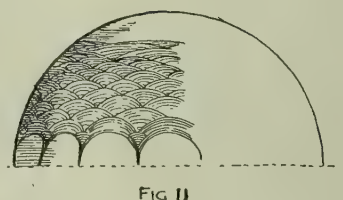

Fig 11

The construction of the crown presented difficulty since the tendency of the bricks fall inwards before the ring to which th belonged was complete increased the nea the summit was approached. The Pers and Arabian builders met this difficulty deflecting the intrados upwards beyond haunches and finishing the dome with conical crown, as shown in Fig. 7. In so small Byzantine examples the contour broken at the haunches, a secondary cup formed, and the crown finally finished wit disc of masonry previously built on a p form, as in Fig. 8. The Byzantine builde however, generally completed their domes a spherical form and probably used a sm wood centre for the brickwork at the cro To counteract the lateral thrust and conv this thrust into a vertical pressure a mass masonry or brickwork was built round base of the dome and carried to the height the haunches, as shown in Fig. 5; and in early examples of Byzantine work, as S. Sophia, Constantinople (Fig. 9), windo are pierced through this mass.

The Byzantine dome is often strengthe by ribs which, in the early examples, w built and bonded with the general brickw of the shell. In the dome of S. Sophia, C stantinople, dating from A.D. 562, forty r spring from the base, where they 3 ft. 3 in. wide, and converge towards crown (Fig. 9). At their springing the p jection of these ribs is only 6 in., while at crown they die into the general surface so distance from the summit. Ribs were so times formed by imparting a scalloped sh to the dome itself, as at SS. Sergius a Bacchus (Fig. 10), and in the dome of inner narthex at S. Saviour in the Cho both at Constantinople, and both dating fr

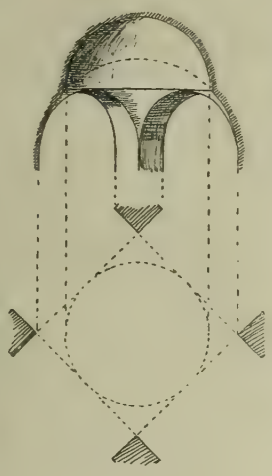

Fig 15.

first half of the sixth century. In the ner case the scallops were doubtless de- ed primarily as a convenient form to erimpose on the octagonal base of the ucture. At later periods ribs became ely decorative features built of bricks not ded with the general material.

n the small dome of the tomb of S. netrius, Salonica, dating probably from fifth century, the brickwork is composed lischarging arches, juxtaposed and built in s forming a series of fan-shaped figures. s disposition was adopted about two hun- d years before in the round temple at lato, and illustrated in Fig. 11. Some es, as that of S. Pantelemon, Mt. Athos, e constructed of rings of interlocked pan- s set in mortar, each ring thus forming on-expansible tie, as shown in Fig. 12. At enna terra-cotta tubes, set in mortar and posed as shown in Fig. 13, were exten- ly used. These tubes were interlocked formed into spiral coils which encircled dome from its base to its crown, and by means a very light dome was constructed which the effect of thrust was overcome hin the shell itself. The dome of S. Vitale. enna, dating from 547, is built in this nner.

The Roman dome was usually constructed a circular base, and arose directly from base, as at the Pantheon at Rome, but n it was desired to apply this method of lting to a polygonal or square space, such formed the central portion and not the le of a building, some manner of support- the circular dome across the angles had e devised. At the temple of Minerva ica triangular shaped corbels were em- ed, and in the tombs of the Via Pales- a tentative expedients of a similar charac- are observed, but the problem was scien- ally solved by the Byzantine architects, designed and built the true pendentive.

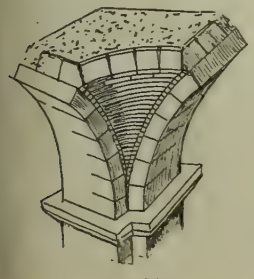

Fig. 23.

e surfaces of the pendentives were ical and may be represented by the re- ing surfaces of a hemisphere when cut ally on the planes of a square drawn n the base and horizontally at the level of the summits of these vertical sections, as shown in Fig. 14. The vertical sections represent the planes of the four arches enclosing the space to be covered and the horizontal section the base of the dome itself (Fig. 15). In the western dome of S. Irene, Constantinople (Fig. 16), the pendentives and dome form parts of the same sphere, as indicated by the dotted line in Fig. 15, but this construction was usually confined to small compartments not lighted by the dome itself. The pendentives were constructed with conical rings of brickwork in a manner similar to that employed in building the domes, but a difficulty was presented by their oblique junction with the transverse arches, as shown in Fig. 17. Occasionally the courses were built as shown in Fig. 18, from S. Sophia, Salonica; or disposed as in Fig. 19, from S. Mark's, Venice; but in both these cases the resulting base for the dome is deformed, as illustrated by the dotted lines on Figs. 18 and 19, and seen clearly in Figs. 20 and 21.

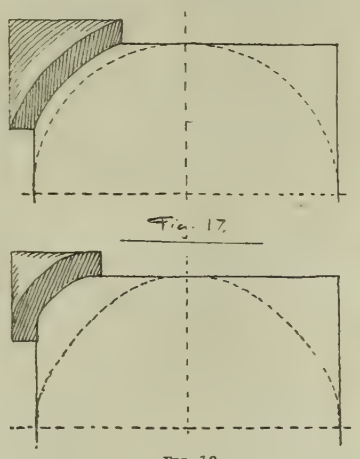

Fig. 19.

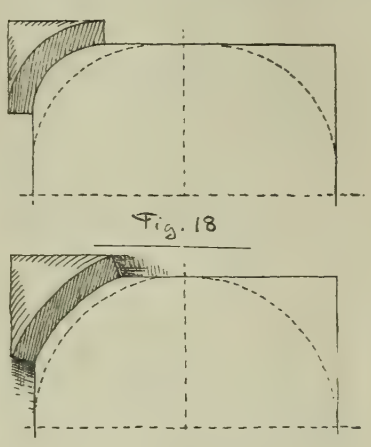

Fig. 22.

When the true spherical form was followed chamfered voussoirs were often placed on the arches to receive the ends of the pendentive rings, as shown in Figs. 22 and 23. The backs of the pendentives behind the rings were always filled in with a kind of rubble or brick concrete.

Fig. 21.—Church of S. Mark, Venice.

BOOK REVIEWS.

Historic Streets of London. An Alphabetical Handbook. Compiled and edited by Lilian and Ashmore Russan. (London: Simpkin, Marshall, Hamilton, Kent & Co., Ltd. Price 3s. 6d. net).

To quote the editors' introductory note: "The book is what it pretends to be—a compilation, an index, a handbook, a ready reference, for which many colonials, provincials, and foreigners, not to mention Londoners, may hold us in esteem." To those who have known the pleasure of holidays in London in the company of some good friend competent to be their guide to its many points of historical interest the handbook brought out by Lilian and Ashmore Russan will call back many happy memories, and for those who have not yet experienced the charm of London streets the information they have so carefully collected will open up a store of good things.

It is of the utmost interest to learn the connection of the great men of the past with the streets of the capital city of the Empire, and in this book, under the name of each street, is given sufficient information to captivate the reader and to direct his further study by reference to the authorities. The probable meaning or derivation of street names has been given in several doubtful cases, and it is interesting to read that Birdcage-walk was probably so called originally and is not a corruption of the French word Bosquet, a clump of trees, as is sometimes stated. "Birdcage-walk, St. James's Park (S.W.1), named from the Aviary established there in the reign of James I, and the Decoy made there in the reign of Charles II (Timb's 'Curiosities of London,' p. 15)."

The names of the more famous streets are associated with brief summaries of the chief persons and events, but owing to the limits of space these lists are not always so long as the facts would warrant, for some London streets have been the haunt of great men of several generations. As the editors admit, "the book might easily have been extended to three times the size such is the wealth of material." They have constrained themselves, however, to keep the volume within dimensions which allow of it being carried in a pocket or in a lady's handbag. Within these limits it is admirable, but the pruning has had to be severe. Bankside, for instance, is rightly associated with Shakespeare and the early theatres, but it might be asked why Sir Christopher Wren's connection with the spot is ignored since it was from his house in Bankside that this great man, who has been proclaimed "the builder of this city," was able to watch the growth of its cathedral church as it was being erected to his design. The note on Westminster Hall, too, obviously suffers from undue brevity since the roof erected by Richard II, one of the wonders not only of London, but of the whole field of mediæval construction, receives no mention. The reproduction of old maps and views from the Goss collection by way of illustration is appropriate, though it may be regretted that the charming picture of Old London Bridge, with its many-storied mansions, is not accompanied by any explanatory reference in the text.

Structural Drafting and Design of Details. By Carlton Thomas Bishop. 2nd edition. (New York: John Wiley & Sons, Inc. London: Chapman & Hall, Ltd. Price 25s. net.)

This book is a new edition revised to suit the changes in the standards of the Association of American Steel Manufacturers. It is produced in good, well printed style, with valuable detailed diagrams. It does not leave essential points to rule of thumb methods, or avoid them, as so many treatises published in this country have done. The drawings and examples given for all kinds of constructional engineering work cannot fail to prove of use for reference to any engaged on this class of work. If many of the rules mentioned in connection with working drawings were adopted wholly or in part by many drawing offices, much confusion and many mistakes would be avoided.

But as this work is intended principally for the apprentice draughtsman and student, it ought to be pointed out that it does not help very much in its practical chapters, as distinct from those dealing with design, those students attempting to grasp the way in which work is detailed and put into the constructional shops in this country. It is essentially concerned with American methods and designing, shop practice and procedure. Except for one or two notable exceptions, British constructional engineers do not follow what is known as the American system of detailing. The tables given are, naturally, based on American profiles, specifications and loadings and, of course, cannot be of great utility in this country where the sections are those of the British Engineering Standards' Association, the specifications those of British authorities based on the British Standard specification, and the loadings those prescribed by some particular railway or British firm of engineers.

A student might also be misled by many American terms used; also, the dictionary of definitions is by no means of general applicat in this country. To take examples. What understood amongst steel erectors in t country as a derrick is described as a gin p whilst a derrick itself is described as "a hoist machine so pivoted that a load may be swu horizontally." Camber is described as a cu in the bottom chord to prevent sag. Camb as we understand it, applies to the whole gird whose depth is maintained. Similarly in reg to notation adopted. What is known as L.C.C. Notation is now more generally used this country. The book under review use notation so similar, and yet so different, as be misleading. Some symbols used are identi with the L.C.C., some have similar meanin and many entirely different meanings.

Dealing with the manufacture of structu steel, it is stated that this "is made by open hearth process." Whilst no doubt th is a lot to be said for this, this limitation is no means so definitely prescribed by the Brit standard specification for structural st Design is not gone into very fully, only so as the design of details and simpler memb of a structure is concerned, with which it deemed imperative that the production, works' draughtsman, should be familiar. S notes as there are on design are good, and chapters dealing with the design of rivet spac and joints can be particularly commended.

The book is an excellent work in many w for those American students for whom it primarily intended—and for British studer too, provided they can keep in mind that i American practice which they are studyi The book emphasises more than ever necessity of more up-to-date British literat dealing with similar points from the standpo of British practice, British loading standar profiles, &c.

A B C of Collecting Old English Pottery. J. F. Blackler. Fourth edition. (Stan Paul & Co., 15s. net.)

The fourth edition of this work will rece a warm welcome from the collector and th possessing family pieces, enabling them account of the numerous illustrations (so 450 in half-tone and line) to identify th pieces. The volume gives a general history English pottery from the earliest period and, addition, mentions some two hundred pott names. The owners of some fine specimens pottery have placed them at the dispo of the author, enabling him to illustrate m fine and unusual specimens. An appendix prices is a useful addition, but from our kn ledge prices to-day have very considera

"Cotcroft," Kelvedon. Mr. F. Sidney Webber, Architect.

[This residence, near Kelvedon, Essex, was recently completed from designs by Mr. F. Sidney Webber, Lic.R.I.B.A., of Blackheath, S.E.3. The building has been erected in local bricks and rough-cast, with bays and dressings in stone. The roofs are covered with handmade red tiles. Electric light generating plant and central heating have been provided. The general contractors were Messrs. Holland & Hannen and Cubitts, Ltd., Bloomsbury, W.C.]

ased since the latest date mentioned, viz.,

Decoration and Renovation of the Home. By ARTHUR SEYMOUR JENNINGS. (London: V. R. Howell & Co. Price £2 2s. net.)

have nothing but praise for this work as ctical book on painting and decorating. e matter of design, however, it is by no s so satisfactory. This defect we have had ion to note before in reviewing Mr. ngs' works. The designs seem altogether out of touch with modern ideas of internal ation; they are reminiscent of the work enty years ago, and not even very good ens of that period. As for some of the ative details, they remind us frankly of orst periods of the "nouveau art" move-

art from these defects, the book is full of ble information. It contains a collection loured plates suggesting various colour es for wall surfaces; in all eighty-nine are , and they are executed with the actual and not by any reproduction process. ook deals also in addition to wall painting its branches, with varnishing, enamelling, arious wood finishes.

very useful chapter for the amateur—and ook is designed to appeal to him—is that gives a selection of the questions which been addressed to the author at various by persons seeking information. Each ion is followed by its proper answer, and householders will find here a remedy for particular trouble. To the architect the er which gives some recipes for paint g will be more useful. The student will ciate the illustrated glossary.

"Cotcroft," Kelvedon: Drawing Room
MR. F. SIDNEY WEBBER, Architect. (*See p.* 332.)

House-Owner's Book. By ALLEN L. CHURCHILL and LEONARD WICKENDEN. (Funk & Wagnalls Co., New York and London: 1922. Price 8s. 6d. net.)

e book is addressed to the non-technical r, and aims at increasing the house-owner's st in and knowledge of his property. The cial aspect of house-owning is first touched House property may not be always a speculation, but a person owning the house ves in does not regard the proposition ly as a case of possible profit or loss. r those who cannot command sufficient al to build a home for themselves the ative methods of mortgages and associa- in a mutual building society are described the general proviso: "It is a safe plan to that one should not pay out money, or into a contract, for the purchase of rty or the building of a home without r legal advice. . . . The contract with the er should be carefully scrutinised by a r, in order to avoid misunderstanding and lties and to make sure that one's rights nterests are fully protected." architect, however, is not mentioned, and portant subjects of selection of site, aspect xposure are passed over in silence. The mportance to the householder, whether he ner or tenant, of having a house planned in n to the great primary, the sun, is too ntly ignored both in America and in n, yet no daintiness of architectural ing can redeem a house that is condemned m and icy draughts through lack of atten- what should be fundamental matters of

chapters on materials are somewhat fuller til, but to the English reader there seems ing quaint in the desire to learn building action for the reason indicated in the ng passage:—"Should you be building, t to build, a house of brick, it is probable some time your architect or your builder gin to talk impressively of 'English bond,' retchers,' and 'headers,' and 'bats.' is no reason at all why you should not e them and gain their increased respect ing them know that YOU know exactly hey are talking about."

rican readers will sympathise with the f view more readily than English, who will be more interested in the special appliances, the home refrigerating apparatus, the garbage incinerator and the vacuum cleaner equipment. The American love for refined exterior finish at all costs appears again in the paragraph on "Hiding the Radiator," and the statement that "with a properly designed radiator enclosure, the loss of heat is very small" is not generally accepted by heating engineers. The advice to hide radiators behind "what is, apparently, a book-case with leaded glass doors, or beneath a charming window seat," &c., will be regarded with horror by architectural purists and even the most catholic-minded will recognise that this is not the way to solve an æsthetic problem. Efficiency of function of any installation should be considered together with its artistic expression, and for success in one direction alone is insufficient.

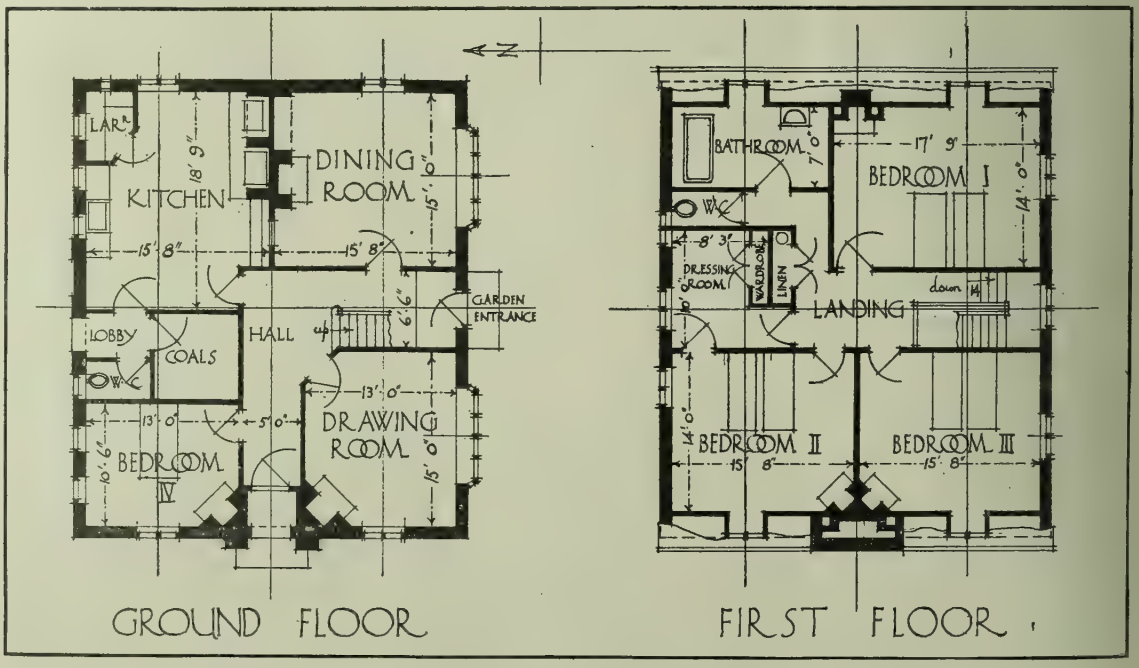
A chapter on "Safety in the Household" contains a great deal of sound advice, and the book includes a collection of tables useful to the American house-owner.

The Golden Hind. (Chapman & Hall, Ltd. 6s. net.)

A quarterly magazine of art and literature, this magazine contains many weird and fantastic drawings, some distinctly German in character, others of the Aubrey Beardsley school. The lithographs are the most appealing, notably those by Walter Spradbery, Grace Rogers, Austin O. Spare, and E. A. Cox. Of the woodcuts, that by Robert Gibbings is worthy of mention. The literary contributions are by Messrs. H. J. Birnstingl, Rabindrath Tagore, Clifford Bax, and others.

Mechanics. Part 1. By Thompson & Leslie. (London: Cassell & Co. 2s. net.)

Elementary mechanics is a very well worn subject, but the authors have succeeded in putting life into the dry bones of this important branch of physics in a manner with which the publisher's elementary text-books have come to be associated. The unconventional character of the book will be evident from the fact that after an introduction on materials, stresses and strains are dealt with, and the use of various trusses is simply explained. Friction, economic and uneconomic, is illustrated by various driving and clutch diagrams. An account of the lever principle is followed by a chapter on machines illustrating its use. The last third of the book is occupied with pneumatics and hydrostatics. Containing 142 illustrations, diagrammatic and photographic, the book should prove an attractive addition to the publishers' library of applied science, and its very reasonable price should make it available for a wide range of readers.



The House Doctor. By R. RANDAL PHILLIPS. (London: 20, Tavistock-street, W.C.2. Price 2s. 6d. net.)

This is a small manual describing everyday jobs and repairs in the home, such as replacing defective washers, sash-lines, and fuses, recovering chairs, and fitting up electric bells. It includes a list of trade preparations, and proprietary articles are also freely recommended in the text. Some of the processes dealt with are of doubtful value, as, for example, the repairing of an old Staffordshire jug by moulding a new lip and painting the design on it with water colour varnished to imitate the glaze. In regard to wall treatment we read that "wall papering involves many difficulties," to which it might be added that the inexperienced amateur who tries to paper his own wall is rightly given a place beside the kipper and the mother-in-law among classical music-hall jokes. The average householder would find this book useful in giving him an idea of those jobs that should easily be done by anyone of intelligence without the aid of an expert.

The Old-World Galleries A B C History of English Antique Furniture. By STANLEY BARRETT, F.S.Arc., L.R.I.B.A. Second edition. (London: The Old-World Galleries. Ltd. Price 1s. 6d. net.)

This is a handy little volume on old furniture, giving much valuable information in a condensed form, and a useful table of dates and periods. The volume also has notes on blue and white Staffordshire pottery with a list of makers and dates. Numerous illustrations of the various periods are shown and the approximate prices appended, a detail so essential to those anticipating furnishing with old furniture. Pieces suitable for a week-end cottage or a mansion are included.

" Oak Knoll." Beaconsfield.

Messrs. Burgess, Holden & Watson, Architects.

[This house was built in 1921. A feature, which was specially desired, is the roomy kitchen accommodation combining kitchen and scullery in one, and making, at the same time, a comfortable maids' sitting-room. The house is built with 11 in. cavity walls faced with red bricks of varied colour. The roof is covered with hand-made tiles, and the external woodwork painted white. The architects were Messrs. Burgess, Holden & Watson of 13, Gray's Inn-square, W.C.1, and Beaconsfield.]

LEGAL SECTION.

NOTES ON CURRENT CASES.

Sub-Letting : Consent.

A decision of the Privy Council on covenants t to sublet without consent in the case Fullers Theatre & Vaudeville Co., Ltd., *v.* fe (1923 A.C. 435) may be noted.

The respondent Rofe was the lessee of certain emises, the lessors being the Municipal Council Sydney, and the lease under which he held property (which we shall call the "headse") contained most onerous covenants. addition to covenants to pay the rent erved, to repair and paint, it contained a venant the breach of which it was specifically ovided could not be remedied, namely, that lessee would not assign or sublet the whole any part of the premises without the consent the Council in writing first obtained; and, o, a covenant as to the uses to which the emises must not be put by the lessee. The pondent had demised part of the premises the appellants, and it is the sublease of this rt of the premises which alone is relevant to point raised and decided in this case. This se, after defining the term "rent," &c., conned first a covenant by the lessees that they uld not (with an immaterial exception) sign or sublet the whole or any part of the emises without the consent in writing of the sor, the respondent, and the Council first d been obtained; and, second, a covenant at the lessees "will not use or permit the ildings and demised premises to be used for y purpose other than one of the purposes entioned in" the headlease. But at the end this lease there was a covenant by the lessor hich was as follows: "The said T. E. Rofe reby covenants for himself, his executors, ministrators and assigns that so long as the y Council of Sydney raises no objection to an signment or assignments, or subletting or blettings of the demised premises, or any part ereof, the said lessor will not object to any ch assignment or subletting."

To understand the points raised, we may ote two statements from the judgment livered by the Privy Council. The first is, Having regard to these onerous covenants and nditions, it was obviously of vital interest d importance to Mr. Rofe that in case the mised premises or any part of them should sublet, the sublessee should be firmly bound perform all the covenants by the lessee ntained in this headlease since the breach of y one of them might at the will of the Council rk a forfeiture of the headlease. And this uld be all the more necessary since it is well ablished that no privity of contract or estate uld exist between the lessor, the Council, d such a sublessee." The second passage is: t is well established by the following horities, amongst others, namely, Treloar *v.* ge (L.R. 9 Ex 151); Sear *v.* House Property Investment Society (1880 16 Ch. D. 387); row *v.* Isaacs & Son (1891 1 Q.B. 417); tern Telegraph Co. *v.* Dent (1899 1 Q.B. 385); t if one finds in a lease a covenant by the e not to assign or sublet the demised mises without the consent in writing of the r first had and obtained, and also a cove- t by the lessor that he will not unreasonably hold his consent to a subletting or such the two covenants must be construed ther, with the result that the covenant he lessee will be held to be qualified by that he lessor."

any of the prohibited trades were carried n the premises the respondent might have own lease, the headlease, forfeited. Now, appellants desired to grant a sublease to named persons, and their solicitors wrote he respondent asking for his consent in ng. They informed him that the term of ublease was to be ten years, and what the was to be, but no information was given the contents of the lease, nothing as to ate, the time from which it was to run, or the purposes for which the demised premises were to be used. They, however, stated that the Council had consented to the sublease, but gave no indication as to the character of that consent, whether it was a mere bald consent. Application was made for the form of the lease, but the appellants did not comply, their view being expressed in a letter from their solicitor that, so long as the approval of the Council was obtained, the respondent's consent was unnecessary. In this they relied upon the clause in the lease to them set out above as to the consent of the Council. It was not until the sublease had been executed and was no longer held as an escrow that a copy was forwarded to the respondent. In the action, the respondent was claiming to re-enter for breach of covenant, and the Privy Council, affirming the two courts in New South Wales, held that the respondent was entitled to succeed in the action as he had not been guilty of any breach of the lessor's covenant; he had not refused to give his consent to the sublease; he had not raised any objection to the subletting as such, but had only asked for information which on every principle he was entitled to, namely, such information as would enable him to ascertain what was the precise nature of the thing he was asked to do.

A second point was relied upon by the appellant, viz., that the breach of covenant had been waived by a receipt of rent after breach with the respondent's knowledge of the breach. It was not until July 28, 1921, that the lessor received the copy of the sublease, and was definitely informed that it had been executed. The last receipt for rent was dated July 27, and that and former receipts bore an endorsement: "Without prejudice to the rights of the lessor under the lease." The Privy Council held that the appeal failed on this point also, and that there had been no waiver, approving the decision Mathews *v.* Smallwood (1910, 1 Ch. 777).

We have often in these pages dealt with this question of waiver, but we may again quote two passages from Mathews *v.* Smallwood, which were specially approved by the Privy Council in this case. "Waiver of a right of re-entry can only occur where the lessor, with knowledge of the facts upon which his right to re-enter arises, does some unequivocal act recognising the continued existence of the lease. It is not enough that he should do the act which recognises, or appears to recognise, the continued existence of the lease, unless at the time when the act is done he has knowledge of the facts under which or from which his right of re-entry arose." Then, as regards onus, "The question whether there has been a waiver in such a case is one of law, and the onus is on the lessee to adduce some evidence of the lessor's knowledge, and proof of an act showing a recognition of the tenancy does not throw the onus of proving want of knowledge on the lessor." We may point out that the compliment of the first rule set out above that waiver of a right of re-entry can only occur where the lessor, with full knowledge of the facts upon which such right depends, does some unequivocal act recognising a continuance of the lease, seems contained in the case Elliott *v.* Boynton, which we noted in our Legal Section on July 27, where it was laid down also that a receipt of rent after the landlord has unequivocally shown his determination to determine the lease for breach of covenant does not operate as a waiver.

Specific Performance : Statute of Frauds.

There have been an unusual number of cases lately turning upon what is a sufficient memorandum in writing on the sale of an interest in land to satisfy the Statute of Frauds. The latest case is Koenigsblatt *v.* Sweet (*Weekly Notes*, June 23). The vendor in that case, who was the defendant, had signed a contract, but left certain blanks in it, and had left it with his agent to be handed over as one part of a contract in writing for the sale of land to the plaintiffs, a man and his wife, in exchange for a similar document signed by them, the agent having authority to fill in the blanks. The agent filled in the blanks he was authorised to do, but he also struck out the name of one of the two purchasers, thus exceeding his authority, as he was only authorised by the defendant to accept the offer made by the plaintiff to purchase the property on the same terms as it had been offered to the plaintiff and his wife. The defendant, however, ratified the act of the agent, and the ratification was to date back to the time when the act was done.

In an action by the plaintiff for specific performance the defendant contended (1) that no binding contract had been originally made, as the agent had no authority to contract with one purchaser alone, and (2), even if the defendant had ratified the agent's act, new terms by that ratification were introduced into the original contract and this would make a new contract, and to that new contract there was no signature by the person to be charged to satisfy the Statute of Frauds as the old contract was the only one he had signed. The judgments of the Courts are at present too briefly reported for us to give the reasoning upon which the judgments were based. The report only states that the Court below held that the Statute of Frauds raised no difficulties, as the plaintiff was suing on an agreement in writing signed by the parties, and the plaintiff was entitled to an order for specific performance on the footing of the title having been accepted, and that the Court of Appeal dismissed the appeal without calling upon counsel for the respondent, the plaintiff. Section 4 of the Statute of Frauds, so far as it is relevent to this case, provides that no action shall be brought upon any contract or sale of lands, tenements, or hereditaments, or any interest in or concerning them, unless the agreement upon which such action is brought or some memorandum or note thereof shall be in writing and signed by the party to be charged therewith, or some other person thereunto by him lawfully authorised. Apparently the Courts must have considered, therefore, that the agreement or contract in this case and signed by the defendant had been duly ratified by the defendant at all material times and represented the contract sued upon.

Agreements in Restraint of Trade.

The decision which we noted in our Legal Section June 29, in the case of H. J. Willett *v.* Beasley, has been reversed on appeal. It will be remembered that the plaintiffs, who carried on business as agents for Ford cars at Colchester, were seeking to enforce an agreement as against a late employee, which, *inter alia*, provided that he should not at any time during the period of five years after the determination of his employment "undertake or carry on or be engaged or directly or indirectly concerned or interested in any branch of the motor business at any place within a radius of fifty miles from the Town Hall, Colchester." The Court below had upheld this agreement, as noted in our article.

The Court of Appeal reversed the judgment of the Court below. The Court referred to passages in Mason *v.* Provident Clothing Company (1913, A.C. 724), and Attwood *v.* Lamont (1920, 3 K.B. 571), and held that the covenant was too wide in two respects—the class of business and the area. The Court held that the words "any branch of the motor business" might include the assembling of parts, the manufacture of cars, or the building of motor boats, and were too wide for the protection of the business in question, whilst the area was also too wide, for it could not be said that it was necessary for an agent in this class of business to be protected over an area of fifty miles which covered part of London. Lord Justice Bankes is reported as having said that those who drew these agreements should not insert a specified area without considering whether it could reasonably be supported.

THE EFFECTS OF CEMENT CONTENTS ON CONCRETE.

At a recent meeting of the Institution of Structural Engineers Dr. Oscar Faber, O.B.E., D.Sc., read a paper on "Experiments on Concrete of Different Cement Contents."

The paper was divided into Parts I, II, and III, from which we take the following extracts:—

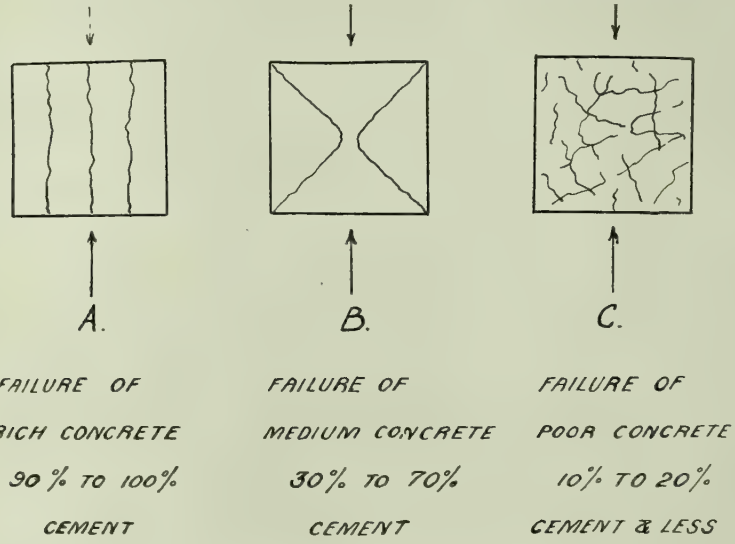


Fig 1.

PART I.

In connection with some work requiring rich concrete, the lecturer some time ago wanted definite experimental results as to how the properties of concrete were affected by varying the cement contents, and could find only isolated and unrelated tests, which, moreover, agreed but poorly with one another. He therefore determined to make a thorough and careful series of tests, in which cubes were made with 10 per cent., 20 per cent., 30 per cent., etc., up to 100 per cent. of cement, with careful measurements of weights of all the ingredients sufficient to furnish data as to weight of concrete, shrinkage of materials, quantities of material required, crushing strength, etc.

Such a series was made in August and September, 1922, and the quantity of water was left to the operator to find by trial, the resultant wetness to be controlled by a slump-test so as to obtain uniform wetness with all mixtures. It was found, however, that in spite of considerable care the results were very variable and bore strong internal evidence of unreliability, which was traced to variations in water content, which, of course, has a predominatory effect on strength of concrete. In other words, it was not found practicable, by means of leaving it to the discretion of the operator, assisted (or perhaps hampered) by a slump-test machine, to get the water contents sufficiently uniform in the various tests to obtain really uniformly varying results having strong internal evidence of reliability and consistency.

A second series was therefore undertaken, in which the water content of each mixture was carefully regulated according to a formula which had been designed to give uniform wetness to both rich and poor mixtures. Even though it was subsequently found that this formula could be improved on slightly, the second series did produce the instructive and reliable results hoped for.

In order to obtain really accurate proportions of cement, sand, and ballast it was found necessary to measure these by weight and not by volume, and it may be pointed out that the same cement can give variations in volume corresponding to a variation of from 90 to 60 lb. a cu. ft., depending solely on whether it be loosely packed or consolidated, and that a given measure filled with cement from a sack will give widely varying weights, and that clearly under such conditions no consistent results could be anticipated if the quantities were measured by volume. The same argument applies to sand and ballast, but to a much smaller extent.

In this series of experiments the ratio of sand to ballast was kept as 1 is to 2 throughout all the mixtures. The sand used was washed Ham River grit (a clean siliceous sand), and ¾-in crushed Ham River ballast.

Throughout the tests a 10 per cent. cement contents means that the weight of cement shall be 10 per cent. of the total weight of *dry materials* (cement, sand, and ballast); from which it follows that the sand and ballast would be 90 per cent., and since the sand is to be half the ballast, the sand would be 30 per cent., and the ballast 60 per cent., of the total weight of dry materials.

The cement percentage might have been taken as the percentage of the weight of *all materials* (cement, sand, ballast, and water), but this would conform less to usual parlance of the industry.

The water content was calculated by taking 25 per cent. by weight of the cement plus 5 per cent. by weight of sand and ballast. It was found that this formula made the very rich specimens rather too dry and the very poor ones rather too wet, and that a better formula is 28 per cent. by weight of cement plus 4 per cent. by weight of sand and ballast.

Subsequent tests were made verifying that this did in fact give proper and uniform consistency to all mixtures, but the formula first given was used in the tests here described.

The cement was of good quality British manufacture.

Conduct of Tests.

The proportions of cement, sand, and ballast were calculated so as to give 5,000 gms. of dry materials in all cases, the cement contents being 10 per cent., 20 per cent., 30 per cent., etc., up to 100 per cent. in the various tests, the remainder being divided between the sand and ballast in the proportions of 1 to 2.

These materials were weighed out, mixed, and the water calculated by the formula given was measured out and added.

Two cast-iron 4-in. cube moulds were filled with concrete, and the remainder of the concrete carefully kept.

After keeping for 24 hours in air the cubes and residue were weighed, and the cubes then kept in water for 28 days, when they were crushed.

The temperature during mixing did not vary outside the limits of 58° to 61° Fahr., and all the materials had been kept in the laboratory to acquire its temperature. The specimens were also kept approximately at this temperature when hardening in water.

The cubes were crushed in an "Amsler" machine. In most cases timber packing was used. The tests marked with an asterisk gave low results owing to a knot in the timber. The average in the curves has taken cognizance of this in giving these tests less

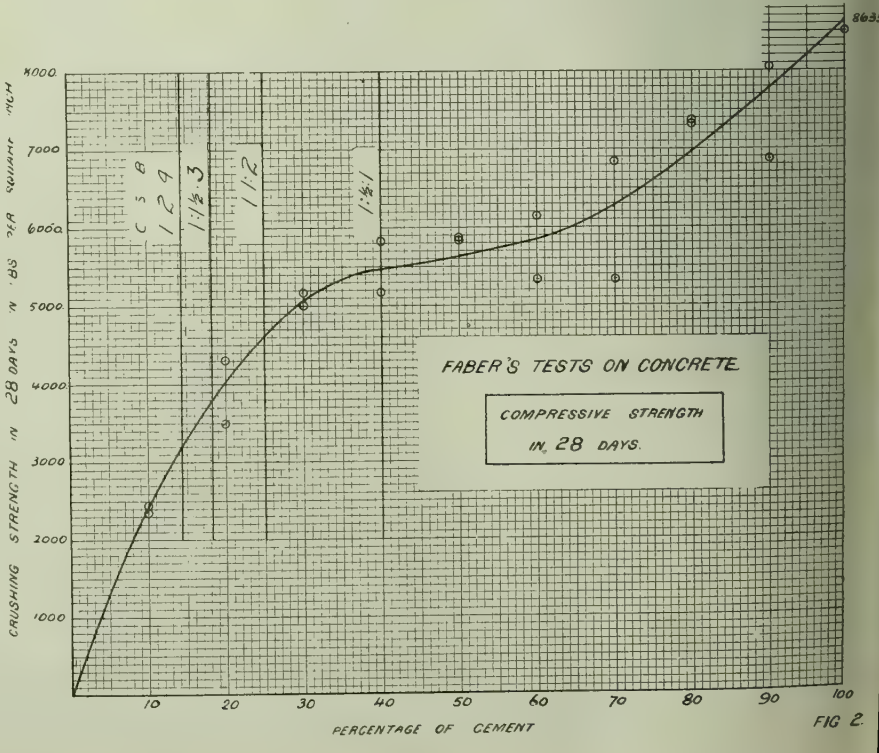

Fig 2.

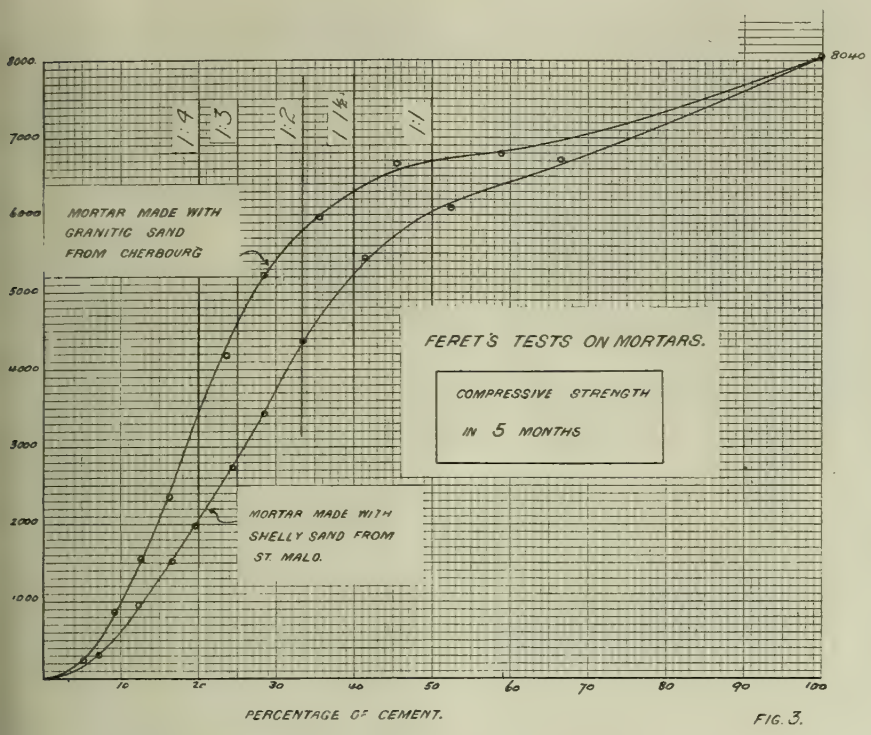

FIG. 3.

portance. The five poorer specimens were shed without packing.

t was very marked that the richness of the crete affected not only the strength but the thod of failure. The richest specimens 0 per cent. and 90 per cent. cement) failed splitting vertically. The medium ones per cent. and 30 per cent. cement) gave usual conical failure, while the poor ones per cent. and 20 per cent. cement and) failed by irregular crushing. These are strated in Fig. 1.

Fig. 2 shows the relationship between the centage of cement and the crushing ength of the cubes. This curve is one of greatest importance and brings out many eresting points.

t will be noticed that the positions on the ve corresponding to 1:2:4 and 1:1:2 rtars are indicated so that the relative ength of these and other similar proportions readily be ascertained.

The crushing strength of 1:2:4 concrete n the curve is 3,150 lb. per sq. in., and t of the 1:1:2 concrete is 4,600 lb. per in. It will be noticed that this is almost ctly 50 per cent. greater than the 1:2:4. s is a matter of considerable interest and some bearing on the L.C.C. Regulations, ch allow 600 lb. per sq. in. for 1:2:4 crete and 750 lb. per sq. in. for 1:1:2 crete. In other words, they only allow a per cent. increase in stress against the per cent. increase in stress actually ascered by the experiments.

g. 2 also brings out the interesting fact between 40 per cent. of cement and per cent. of cement there is only a very l increase in strength. After that, how- the increase in strength with additional nt contents again becomes appreciable. is a very interesting fact, and can readily nderstood if the strength of the concrete nsidered in terms of its tensile strength s vertical or oblique planes. It is of st to note that the curve between com- ve strength and cement contents has a different shape for concrete from its with cement mortars.

. 3 gives the corresponding curves drawn results published by R. Feret in 1897. ll be seen that the curvature in the case mortar curves is quite different, and a arison of the two is of considerable st.

haps the next interesting fact emerging these experiments is in connection with the shrinkage—that is to say, the reduction in volume of the dry materials which takes place when they are mixed together and wetted to form concrete. To ascertain this, not only were the materials actually weighed as mentioned and the volume of the concrete in the cubes ascertained, but the residue of concrete left over when the cubes had been made was also carefully measured, so that the total quantity of concrete produced from a given quantity of material was definitely ascertained. This shrinkage is, of course, of enormous importance to contractors, because from it can be calculated how much cement and materials are required to produce a cubic yard of concrete.

The shrinkage rises consistently with the richness of the mixture from about 18 for neat cement to about 36 for a 10 per cent. mixture. In other words, 100 parts of dry material were required to produce 64 parts of concrete, or that $100 \div 64 = 1.56$ cu. yds. of dry material are required to produce 1 cu. yd. of concrete of this particular richness. Of this 1.56 cu. yds. the cement would represent, roughly speaking, 0.16 cu. yds., leaving about 1.4 cu. yds. to represent volume of sand plus volume of ballast measured separately.

Generally speaking, the results of these tests confirm those of many other previous tests, which all go to show that the amount of shrinkage is generally greatly underestimated by contractors when estimating for concrete.

In the calculation of these shrinkages cement was taken as weighing 90 lb. per cu. ft. In practice it may actually weigh less, depending on its condition, and in such cases the shrinkage would actually be greater. Figs. 4 and 5 show the relationship between the volumes of cement, sand, ballast, and water, and the volume of dry materials and total materials, and should be of considerable assistance to contractors in estimating.

Fig. 6 gives the weight of concrete in lb. per cu. ft. for the different mixtures at different periods, from which it will be seen that the weight per cu. ft. increases as the cement content is reduced. These results also show that the cubes lost about 3 per cent. of water by evaporation in the first 24 hours, and re-absorbed about the same amount in the subsequent 28 days under water.

It is found that the safe stress for a 1:2:4 concrete works out to $3{,}150 \div 4$, which is nearly 787 lb. per sq. in. This is, of course, considerably higher than the present L.C.C. allowance of 600, and it would appear that the figure of 750 lb. per sq. in. which the lecturer had for some time been urging the L.C.C. to adopt in the revised Regulations is fully justified by the experiments.

As a matter of interest in passing, the corresponding safe stress to give a factor of safety of 4 for the 1:1:2 concrete comes to $4{,}600 \div 4 = 1{,}150$ lb. per sq. in. Naturally, he would only use these stresses when the materials were equal to those used in the tests.

In the experiments just described the lecturer expresses his indebtedness to Mr. H. T. Desch and Mr. Derek Hannen, who co-operated with him in conducting the tests and provided the necessary facilities, and whose interest aided materially in securing such accurate and consistent results.

PART II.

Experiments on the Variations of Volume in Proportioning Concrete.

Engineers, architects, and contractors have been in the habit of specifying concrete to be

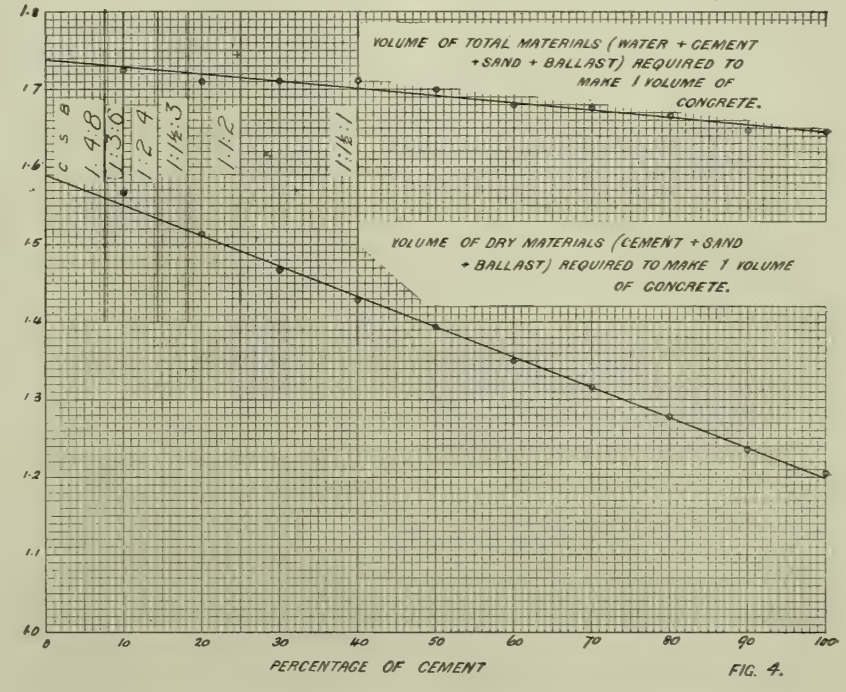

FIG. 4.

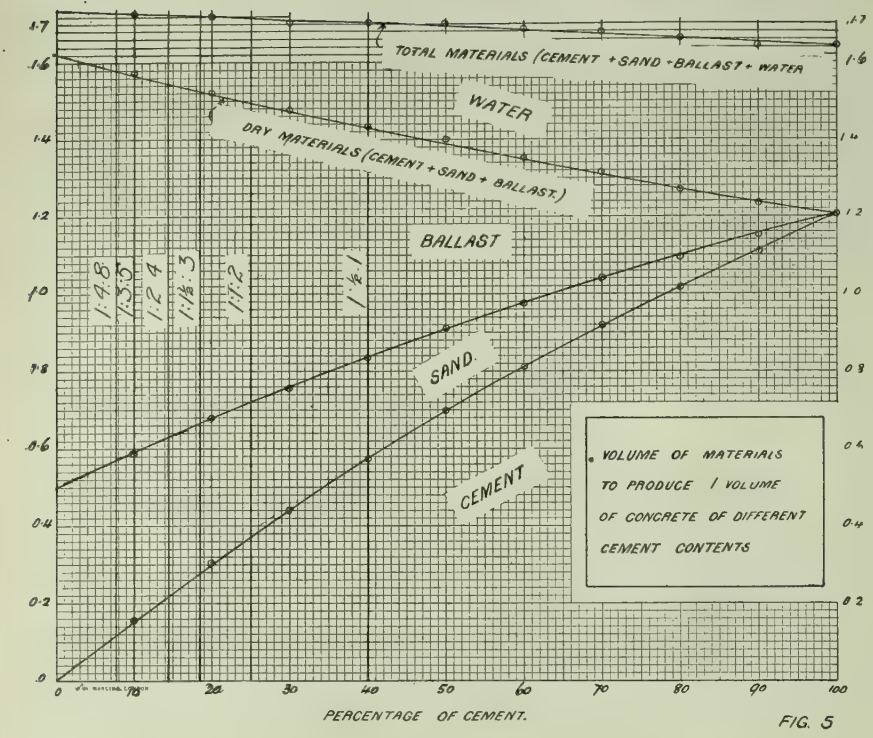

FIG. 5

apportioned by volume. For example, a common specification is 4 parts ballast, 2 parts sand, and 1 part of cement, all measured by volume. To this custom there are grave objections, owing to the fact that a cu. ft. of cement may represent anything between 60 and 90 lb., depending on the extent to which it is consolidated, or to which, on the other hand, air has been occluded between the cement particles, and in the same way, but to a much lesser extent, the amount of sand in a given volume varies with its wetness and its degree of consolidation.

He was aware of this discrepancy, but it was Mr. Desch who first opened his eyes to the extent of the variations, which he had never realised were so great as they are, and it was with a view to ascertaining this in a different manner that experiments were put in hand to show how much a given volume of cement and sand could vary in weight under different conditions. The actual cement used in the previous experiments was found to weigh 1,432 grams per litre when put in the litre pot and shaken until it was thoroughly consolidated. As 1,445 grams per litre corresponds to 90 lb. per cu. ft., it will be seen that this was a common figure.

The cement was then filled into the litre pot by allowing it to trickle in from a vessel held some distance above it through a very small orifice, so that the cement dropped in a thin stream through the air and settled in the litre pot without any shaking. When it had filled the pot and some distance above it, the excess over the top of the pot was cut off with a trowel and the contents were weighed. The weights in two separate experiments were 955 grams and 950 grams respectively per litre. This corresponds to about 60 lb. per cu. ft., and represents only two-thirds of the previous weight. For this particular cement the two figures of 90 lb. per cu. ft. and 60 lb. per cu. ft. represented the maximum and minimum weights of the cement which could be obtained by variations in compaction obtained by shaking.

It was thought to be interesting to see what actual weights would be obtained by scooping the cement with an ordinary cement scoop direct from the barrel and filling the litre pot without any shaking. The results of four consecutive experiments were as follows:

1,105 grams per litre.
1,206 ,, ,,
1,074 ,, ,,
1,079 ,, ,,

These results lie intermediate between the maximum and minimum values previously recorded, and lie rather below than above the mean, and correspond roughly to about 70 lb. per cu. ft.

The significance of these variations is, of course, as follows:—The proportions by volume for concretes are generally based on cement weighing 90 lb. per cu. ft., but actually the cement may weigh as little as 60 lb. after it has been sufficiently disturbed and is poured into the cement measure as loosely as possible. In such cases the engineer thinks he is getting 6 to 1 mixture on the basis of 90 lb. per cu. ft., when actually he would only be getting a 9 to 1 mixture on that basis, and in practice would actually get something which would lie intermediate between the two values.

When the cement is loaded into barrels or sacks at the works its weight per cu. ft. approximates to 70, and its transit by rail and carrier has the effect of consolidating it so that it frequently weighs about 90 lb. pe cu. ft. when it arrives at its destination What it would weigh in the actual measur on the banker board would depend entirel on the way in which it is filled into suc measure, whether it is shaken or filled loosely It is clearly most unsatisfactory that varia tions of this magnitude up to 33 per cent. i the cement contents can occur, and this i equally unsatisfactory from the engineer's o architect's points of view as well as that o the conscientious contractor, and to obviat this difficulty the lecturer considers it ver much better to specify concrete as follows:—

. . cu. ft. of ballast.
. . cu. ft. of sand.
1 bag of cement containing not less than 200 lb.

Experiments were made to see to what exten the same variations occurred in the case o sand and ballast. It was realised, of course that they would be much less, but it wa desirable, nevertheless, to ascertain thei actual values.

PART III.

The lecturer was recently called in t advise in connection with some retainin walls. A large site had been excavated to depth of 30 ft. approximately, and the sur rounding earth, together with the building upon it, were being retained by means of brick wall 3 ft. in thickness. At the tim when he was called in the wall was showin signs of overturning owing to the pressur of earth behind it. It was immediatel shored to render it safe, and subsequentl strengthened as described.

In connection with this work the lecture formed the opinion, after an examination o the soil, that the pressure on the back of th wall might safely be calculated at a pressur of $p=30\ (h+6)$, where "p" is the hori zontal pressure in lb. per sq. ft. and "h" is the depth in ft. from the top of the soil The effect of the buildings behind the wal could be allowed for by an equivalent sur charge of 6 ft. of earth.

On this basis the horizontal pressure at th top of the wall would amount to 180 lb. pe sq ft., and that at a depth of 30 ft. t 1,080 lb. per sq. ft. It was desired, fo several reasons, to have a check of these pres sures if possible, and it was found that th trench for the retaining wall was strutte across by means of horizontal timber strut

E. 1128.

FIG. 7.

7 ft. apart in both directions, the sectional area of the struts varying between 7 in. sq. and 8 in. sq.

This, of course, was on the portions of the wall where the dumpling had not been removed, and where the struts were still resisting the full horizontal pressure corresponding to their particular depth. It was noticed that the struts had indented themselves to a considerable distance into the horizontal timber walings, and this suggested the means of checking the earth pressure. A particular strut half-way down the wall was found to be $7\frac{1}{2}$ in. sq., and the indention to the horizontal timber, which amounted to about $\frac{3}{8}$ in., was measured. A similar strut and a similar piece of waling were then tested in a testing machine, and it was found that a pressure of about 28,000 lb. was required to produce the same indention of the strut into the waling.

Having regard to the fact that these struts were 7 ft. apart in both directions, it was possible to check back, and calculate that the earth pressure at this depth must be of the order of $28{,}000 \div 49 = 570$ lb. per sq. ft. The calculated pressure at that depth by his assumed pressure curve comes to 630 lb. per sq. ft., which was considered to be in close agreement.

This was considered of sufficient interest to be recorded, because it is not often engineers have opportunities of checking the pressures for which retaining walls need to be designed.

As a matter of interest Fig. 7 is added, showing how the walls were actually strengthened. A reinforced concrete buttress of rather peculiar design was constructed against the inside of the wall at intervals and efficiently bolted to the existing brick walls. Its effect is to increase the leverage of the weight of the wall from about 1 ft. to about 15 ft., and is therefore obviously extremely effective in supporting the wall against any tendency to overturn. It will readily be appreciated how extremely economical this method of strengthening the wall was as compared, for example, with the construction of a continuous reinforced concrete wall inside the brick one, which would have been the only practicable alternative which would have given adequate strength to resist the pressures which actually were found to exist.

From a point of view of obstruction, the arrangement adopted also proved to be peculiarly convenient, as these buttresses could be placed in certain recesses in the brick wall. It will be noticed that the buttresses are very heavily reinforced, as might be expected, as the pressure on a considerable width of wall was being resisted by a buttress only 4 ft. wide, and it was necessary to reduce the dimensions to an absolute minimum, with a view to causing as little obstruction as possible.

"REINFORCED MUD."

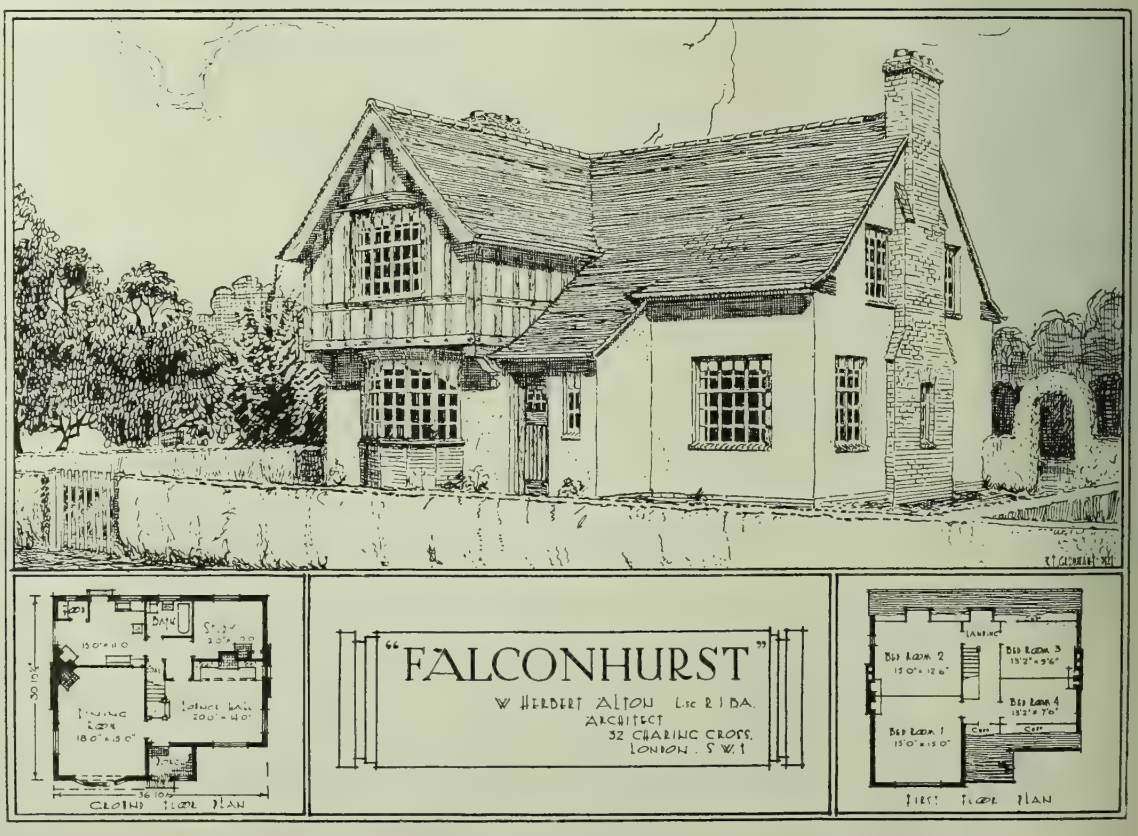
A Correspondent, "C. E. R." writes:—

The repairs recently carried out at the old "White Horse" inn at Shere, Surrey, brought to light certain old-time methods of construction that should be of interest to modern builders. This inn is upwards of six hundred years' old, and its stout oak timbers will probably last for centuries more. The repairs necessitated the demolition of the old tiled roof, which was erected about three hundred years' ago, and upon removal there was discovered a second complete roof below. This second roof was made of "wattle," clay and mud, extremely hard, having weathered the storms, it is believed, of some three centuries prior to the erection of the tiled roof.

The mud, which was compact and of considerable weight, was held together by a coarse straw, and where it was necessary that the slabs should be stronger they were further reinforced by the imbedment of straight sticks, about half-an-inch in diameter. These sticks were much eaten into by worms, and age had rendered them very brittle.

Whereas the tiled roof was pitched at 45 degrees, the mud roof was at 30 degrees, and curiously enough its axis was at right-angles to that of its successor, and it had therefore quite independent timber queen-post trusses. These latter, which form part of the main framing of the house, still remain, as do portions of the mud slabs, since in parts the ceilings of the upper rooms are depended from them.

In one place the cavity between the two roofs was occupied by a bacon-loft, and the smoke had hardened and well preserved the wattle in which it was formed.



In spite of recent renovations, the house is still in bulk mainly fifteenth century work, and the wondrous old beams, and fine inglenook for which the inn is justly famed, still remain.

MORTEHOE CHURCH.

Mr. W. McG. Eagar, Secretary of the Garden Cities and Town-Planning Association, writes:—

"Sir,—The photographs of the bench-ends in Morethoe Church, reproduced in your issue of August 24, bring back familiar memories to those who know the West Country. A number of churches in Cornwall have bench ends so similar that they would appear to be the work, if not of the same hand, at any rate of the same school. Some of the most notable are the Parish Churches of St. Ives, Mullion, St. Mawgan-in-Pydar, St. Goran and St. Keverne. Strong traces of Italian influence have often been detected in them, and it is often stated that they are the work of Italian carvers who travelled round the West Country at the end of the seventeenth century. I have never heard any authoritative explanation, and it would be very interesting if any of your readers could give more precise information.

"The heads shown in panels in bench-ends of this type frequently bear an amusing resemblance to kings and knaves on playing cards (see Fig. 4 of your Mortehoe illustrations); at St. Ives there is a mermaid, and in one church St. Goran, there is a representation of the Holy Trinity, one head with three faces, one shown full and two in profile. The vigour and fancy of the artist or artists are remarkable, and though freedom of invention were given full play in the central panels, the form of the panels with their tracery and carved beadings, are remarkably uniform."

House at Coulsdon, Surrey. Mr. W. Herbert Alton, Lic.R.I.B.A., Architect.
[This house is being erected at a cost of £1,400.]

THE BUILDING TRADE.

UILDERS' ACCOUNTS.*

ns book deals in a thorough manner with complicated problems to be found in dealing the subject summarised under its heading. stated in its introductory remarks, the ial feature of the accounts of this trade costing accounts, which are so necessarily rt of its system, and in dealing with these nical accounts it is essential for a builders' untant to have a practical knowledge, t from his purely book-keeping knowledge. instance, his knowledge of the trade and discounts for various classes of goods, both ssing accounts for payment and for charging lients, necessitates him often being more tradesman than a book-keeper, and he is more valuable as such, leaving the com-'s accountant to tackle the higher accoun-y problems, such as the balance sheet and t and loss ledger. Our remarks are, there-confined more to the costing books as

hilst the whole of the books mentioned are y useful, in actual practice the problem of of staff in keeping them at once arises. instance, the "Register of Tenders" most useful reference volume, but to a firm it would require one clerk to do ing else but keep this register, and how would its pages of figures be looked at eference purposes? Ask the estimating If any particular job is wanted for ysis, it can always be done. The same with rtmental costs. Whilst it is very desirable ow that the joiners' department is paying and the smiths' department is losing y, when one comes to find the necessary to keep the costs of each department and isition goods from one department to ner, plus establishment charges and profit, poor estimator finds the costs of his job poor goose that lays the golden eggs) f all proportion to what he can get paid in etitive prices.

e "Purchase Journal" rulings are very rtant, and those shown should be amplified r headings, instead of at the side, to include ge, plant repairs, office trade expenses, and ances, all such totals to be agreed at the end e financial year with the prime cost books. ages book: With regard to this item, we nly say here that this system seems to be ed to benefit (1) the printers; (2) the tional Association of Clerks and Time-ers"; and (3) the Inland Revenue. For nce, "a *separate* sheet for every trade made up *every night* and posted to the and entered up in a wages' book." What matter with a weekly pay sheet made up ch job from a daily time book and sent yard on Friday for the amount of wages ed? A wages' *book* is surely only neces-or the yard wages, so that each depart-can be analysed and balanced. We notice, ssing, "deductions for local hospital." s presumably ready for when hospitals are a State charge, but surely a little previous sent, and what about the Truck Act?

ntract Journal."—This, we presume, is ed as a wages cost book of each depart-at the works, showing the cost of each der its number, but should be amplified to material, thus getting a total cost in ok.

Wages Cash Book.—The author has ly gone into the matter very extensively ide this as a necessary book, but we differ im as to the necessity. Possibly, owing unemployment benefits in vogue, men v rarely compelled to ask for "subs.", en so done it is surely a matter only for nal note by the foreman on the time book to ensure his getting repayment on the following pay day. Special cash books are not required in London. Yard stores accounts are very necessary, and with a system of bin cards to check stores "ins" and "outs" require full time services of a storekeeper and assistants, the question of classifying and entry of credits from contracts returned into stores being an item requiring a lot of care and time on the storekeeper's part.

Contract ledger as shown, generally called prime cost ledger, would not be found practical for large firms, and would require to be considerably condensed, showing name of each contract at side with headings for wages, materials ex yard, accounts direct, transport, machinery, plant hire, petty cash, &c., so that all contracts are thus classified and the total spent on each shown every month. An establishment charges P.C. ledger should also be kept under the same headings, showing the total expenditure monthly on machinery, plant, trade expenses, &c., and percentage allocated to each contract.

lers' Accounts. By JOHN A. WALBANK, F.C.A. : Gee & Co., Ltd., 6, Kirby-street, E.C. 1.) net.

BUILDING EXAMINATIONS.

MR. W. J. STONE writes:—

SIR,—I have read with much interest the letter of Mr. Gayer in your issue of the 17th, and I particularly noted the third paragraph, in which is indicated a form of registration for builders, a much-needed reform and one that will be welcomed by all builders and architects of merit. My article was designed to point out the bad construction of the Institute's Syllabus, and this appears to be amply justified in Mr. Gayer's admission that modifications are already contemplated.

As regards the charge of "not being constructive," presented by Mr. Gayer, I must point out that eighteen months ago the constructive side was suggested in my letter from the Building Surveyors' Association to the Institute, along with copies of letters to the Board of Education, and again as recently as April, 1923, and had the Institute taken the matter up then probably some of the anomalies might not have occurred and the anticipated modifications at so early a stage might have been avoided. This surely is some reflection upon the bodies with whom the Institute has collaborated. I still think it would have been wise and courteous to have conferred with some of the technical teaching staffs in addition to those referred to by Mr. Gayer, as the scheme bears evidence of hurried work.

It can be agreed, I think, that the cardinal point is that the Institute is one for (federated) master builders only. If so, one can accept their claims for the right to lay down the restricted conditions such as appear in the syllabus just issued. I confess that I looked upon the Institute from a much broader standpoint, and I seriously question the wisdom of the Institute in so restricting itself. Most of the industrial institutions and associations have a distinct national character, both educationally and commercially, and both the employing and employed class have admission on equal terms, usually by some form of examination, and these institutions set their standards of technique, etiquette, and commerce.

With respect to the building industry, it is perhaps the most disorganised of any of our great national industries, when, as a matter of fact, it should be the most complete, as it is one of the most important of the nation's callings. The aim should be one great national association or Institute of Builders representative of all branches—architectural, engineering, building, manufacturing, commercial, in addition to the scientific, technical, and educational side—and should be available as a national court of appeal and reference. One well-organised set of examination syllabuses issued by such an Institute after approval by the various interested sections would command national support and carry national prestige worthy of the British building industry.

If the various examination syllabuses are examined it will be found that the standard is so variable as to be amazing. Why should the standard of structural building work be different in each of the architectural or engineering and surveying associations? In one comprehensive and properly-graded syllabus the various stages might be used or adapted to the different associations.

Briefly, I would suggest a syllabus similar to many now in use covering the period of adolescence—from sixteen to nineteen years—dealing with the fundamentals and forming a groundwork on which most students could build and direct their future studies. Such a course would require attendance at an evening school or college for three evenings per week. Following this would be a two- or three-year advanced course, and at the age of twenty-one or twenty-two years students so desiring would specialise and follow on to a degree course mainly through the day colleges or universities. Many students for business reasons must necessarily move about the country, and if there be no syllabus of a national character much of their work becomes valueless unless repeated in accordance with local demands. A desirable object would be to reduce the number of examinations. Instead, I find they are increasing in number. We have the Institute of Builders' just issued, and shortly the Clerks of Works and Builders' Foremen will be issuing their scheme, whereas if such a syllabus as briefly outlined were available, each of the associations could select the year or grade of work most suitable to its requirements. A further example in the allied branch of carpentry and joinery can be cited, where there are three distinct examinations in the final grade. Imagine the rivalry and unnecessary complexity the student has in determining which of the examinations he should take!

The personal reference to my walk in life is scarcely worth mentioning, but for Mr. Gayer's information I might add that a number of my students are now quite creditable employers. It would perhaps have been better if the remark had been supplanted by reference to other more important points raised in my article. One does not doubt that the accountancy and book-keeping side requires close observation at all times, but the careful training of the building craftsman and artisan (who compose the great mass of the persons who will be affected by examinations) is much more important. The skilled organisation and direction of work can only be brought to a high level by a sound educational policy leading to a scientific study of the various arts and crafts and a broadening of the conceptions of life and citizenship. I sincerely trust the Institute will keep the broader outlook in view when the contemplated amendments are being considered. One might close by quoting Sir Charles Higham, speaking at a City Livery Club luncheon recently; he said: "We are famed for British quality: let us not lose that reputation."

Quarry Owner's Estate.

Mr. Aspinall Brooke (73), of Fenny House, Hipperholme, Yorks, quarry owner, stone merchant, and brick manufacturer, left £9,817, with net personalty £7,241.

ESTIMATING FOR SMALL BUILDERS—V.

By J. H. BARNS, F.I.O.B.

IRONMONGER.

It is difficult to attempt briefly to convey any information relating to this trade, as there are dozens of different qualities, sizes, gauges and patterns of most of the articles, and a fair acquaintance with the trade is essential. The most ordinary items are butt hinges. The cost of these will depend upon the material, whether pressed steel, cast iron, wrought iron, or brass; also upon the width of the butt when open, as the narrower butts are usually the cheaper. If the butts are narrow the screws sometimes align, which may tend to split the wood; the wider hinges have the screw holes alternating. The cheaper butts, especially the cast ones, usually fit loosely at the joints.

The cost of the pressed steel and wrought iron butts will depend upon whether they are to be of one or two thicknesses of metal, and the number of knuckles in the joint. Japanned iron casement stays of the usual common pattern can be bought from 2d. to 2s. each. Iron cockspur casement fasteners can be bought from 3d. to 2s. 6d. each for the ordinary ones with the mortice plate attachment; those with hook plates cost a penny or two more.

Examples of Cost of Ironmongery fixed complete.

Cast-Iron Butts (say, equal to Baldwin's 200).

	Long.			
Per pair ..	2½″	3″	3½″	4″
Hinges	4d.	5d.	7d.	8d.
Screws, say ..	2d.	2d.	3d.	3d.
Fixing to deal ..	10d.	11d.	1/–	1/2
	1/4	1/6	1/10	2/1
Profit and on-costs, 15 per cent. ..	2d.	3d.	3d.	4d
Total	1/6	1/9	2/1	2/5

Fixing to hardwood, say, 50 per cent. extra.

Heavy pressed steel butts about the same price as cast-iron butts.

Wrought-Iron Butts.

	Long.		
Per pair.	2½″	3″	4″
Hinges	1/4	1/7	2/8
Screws, say	2d.	2d.	3d.
Fixing to deal	10d.	11d.	1/2
	2/4	2/8	4/1
Profit and on-costs, 15 per cent.	4d.	5d.	8d.
Total	2/8	3/1	4/9

Ordinary Cast Brass-Steel Washered Butts.

	Long.			
Per pair ..	2½″	3″	3½″	4″
Hinges	3/–	3/6	4/3	5/–
Screws	3d.	3d.	4d.	4d.
Fixing to deal ..	10d.	11d.	1/–	1/2
	4/1	4/8	5/7	6/6
Add profit and on-costs, 15 per cent.	8d.	8d.	10d.	1/–
Total ..	4/9	5/4	6/5	7/6

Japanned Cross Garnet or "T" Hinges.

These are made in several different weights. The following prices are for a rather light kind:—

	Long—Per pair.					
	10″	12″	14″	16″	18″	24″
Tee hinges—	6d.	8d.	10d.	1/2	1/3	2/6
Screws, say—	2d.	2d.	2d.	3d.	3d.	3d.
Fixing—	1/–	1/2	1/2	1/3	1/4	1/6
	1/8	2/–	2/2	2/8	2/10	4/3

Profit and on-costs, 15 per cent.—

3d.	4d.	4d.	5d.	5d.	8d.
1/11	2/4	2/6	3/1	3/3	4/11

Heavy wrought-iron tee hinges would cost about 8d. per lb.

Japanned Iron Barrel Bolts with Brass Knob with Staples.

	6″	8″	10″	12″
Barrel bolts ..	7d.	1/3	1/6	1/10
Fixing	8d.	8½d.	9d.	10d.
	1/3	1/11½	2/3	2/8
On-costs and profit, 15 per cent.	2d.	4d.	4d.	5d.
	1/5	2/3½	2/7	3/1

Sash Fasteners.

There are many different patterns and materials in which they are made, the cheaper are in cast iron and the better ones in brass. The better qualities are somewhat on the lines of Hopkinson's Patent (which has, I believe, expired), and was in a form having a splayed shoulder to the moving arm to prevent tampering with window. A cheap 2¾ in. brass sash fastener costs 1s., and fixing 9d. Iron sash fasteners cost about 3d. each and cost of fixing same as before.

Black Casement Stays.

	10″	12″	long.
Japanned, with pins ..	1/–	1/2	each.
Screws	1d.	1d.	,,
Fixing	8d.	8d.	,,
	1/9	1/11	,,

Cockspur Casement Fasteners.

Cockspur	1/– each
Screws	1d. ,,
Fixing	8d. ,,
	1/9 ,,

The better qualities of casement stays and fasteners and ironmongery generally will cost more to fix. There are so many kinds of rim and mortice locks that, although no attempt will be made to detail their differences and prices, the following particulars will give some general information relating to the cheaper kind of locks, as it is useless to quote prices of locks without giving some details of the case and action of the lock.

Mortice Locks.

Sash ward locks with rough wrought interior, iron bushes and tumblers, brass bolts, thin stamped brass striking plate, Japanned case either 5 in. or 6 in. long and about ½ in. thick, 2s. 6d. each; similar lock, but with brass bolts and tumblers, 3s. each; ditto, but steel pressed action, strong spring brass bolts, japanned case, one lever, 3s. 3d. each; ditto, but polished wrought case, worth about 4d. more than last; ditto, polished case, brass bolts, tumbler and bushes, two lever, cast striking plate, 5s. 6d. each; ditto, but four lever, 6s. 6d. each. Most locks are now made reversible so as to be suitable for either hand. If locks are of fair to medium quality they will be made for the keys either "to pass" or "differ" without extra charge.

A fairly good lock can be obtained "in suites" subject to a master key without extra charge, except the cost of the master key, which varies from 2s. 6d. to 20s. each. With the better grades of ironmongery the screws for fixing are sometimes supplied by the makers. In most cases they are the ordinary wood screw with the slot at the top slightly enlarged as it is considered that the ordinary screw is likely to have the slot burred when driven. The additional cost of such screws is usually considerable, probably 2d. each. Half rebated or full rebated mortice locks are made in many of the grades of locks, and the cost of these are about 5s. to 10s. per lock. Rim locks are a little cheaper than mortice locks, and the remarks relating to them will apply to the former locks except that the cases of rim locks are usually japanned as the refinement of polished iron cases to rim locks has as yet hardly arrived to add a further joy to the life of the labour-loving housewife. T the small builder locks may be roughly plac into two categories, viz., those that are proper fitted, and those which are not. The easiest w to test the fitting of the "works" of a lock is press the follower with the thumb and if it go back in perfect alignment and without wobl it is reasonably well fitted and may be furth examined, but if the follower wobbles and obviously badly fitted it should be rejected unworthy of further inspection.

Rim locks will cost between 2s. 6d. a 12s. 6d. each, and mortice locks from 2s. 6d. 20s. each. Fixing rim locks from 2s. each a upwards. The cost of fixing mortice locks from 2s. 6d. to 7s. 6d. each, and will depend up whether the door has been prepared duri manufacture to receive them. The ret charges for ironmongery are considerably high than the wholesale rates, but it is doubtful if will pay the small builder to buy in large qua tities, as the cost of warehousing and keepi ready for immediate use a fair proportion of t great variety of items of ironmongery requir would probably amount to much more than t increased cost due to retailers' charges.

Brass Cabinet Locks.

These may roughly be described as comi within two classes:—(1) Till locks and straig or cut cupboard locks; (2) box and desk loc

The difference between the straight and t cut cupboard lock is that the straight cupboa lock is simply screwed on to the door and t "cut cupboard" has to be recessed into the st of the door and consequently costs more to f The desk lock has a sloping top plate.

The cost of fairly cheap brass cabinet loc each would be as follows:—

Long.	2″	2½″	3
Till or cupboard locks	1 lever	1/–	1/1	1/
Do. ..	2 ,,	1/6	1/7	1/
Do. ..	4 ,,	2/–	2/1	2/
Box and Desk	1 ,,	1/2	1/3	1/
Do. ..	2 ,,	1/7	1/8	1/
Do. ..	4 ,,	2/5	2/6	2/

The cheaper brass cabinet locks (say 1 lev usually have the brass cap at back riveted those of a little better quality have the screwed on. These locks are supplied neith "to pass" or *en suite* without extra charge.

Example:—

1—3″ brass 4-lever till lock.

	s.	d.
1—3″ till lock	2	2
Screws, say		1
Fixing, say	1	6
	3	9
Profit and on-costs, 15 per cent.		7
	4	4

The cost of fixing till locks will depend whether the locks can be recessed into drawer machine or must be done by hand, the for method is worth about 8d. and the latter ab 1s. 6d. If a thread escutcheon were require would have to be added on and would about 2d. for the escutcheon and 3d. for fix

Lock Furniture.

The slightly better qualities are usually ma factured on the lines of some (obsolete) pa and are so described. The cheaper patterns usually unsatisfactory as the handles freque become loose. The cost of furniture for rim mortice locks will depe n upon the syster patent under which it works, such as "Mac "Pitts," &c., and whether the handles are of or stout metal or solid cast, and an additi charge will be made for anything of an mental pattern. The cheaper qualities of furniture are described as for a certain lock, 6 in., 7 in., or 8 in. lock furniture, the difference being that the knobs of the 8 in. furniture would be about 2 in. diameter an 6 in. about 1¾ in. diameter. Other descrip of lock furniture are sold by the diameter knobs or pattern of handles.

Cheap Brass Lock Furniture (Per set).

	6″	7″	8″
Drilled through rim furniture	8d.	10d.	1/–
"Maces" rim furniture	1/–	1/1	1/2
"Maces" mortice furniture	1/7	1/9	1/10

Example :—

	s.	d.
1 set 6″ mortice furniture	1	7
Fixing		9
	2	4
Add profit and on-costs, 15 per cent.		4
	2	8

The cheaper patterns of finger plates are worth about 6d. to 9d. to fix.

A double-action brass floor spring, made by a well-known London firm of spring makers, can be obtained for 60s., fitted with brass adjustable shoe and top centre. This would be suitable for all ordinary doors and guaranteed for three years. A similar floor spring, but prepared for exceptionally heavy doors in exposed positions would cost £5. If the first mentioned floor spring were fitted with check action, the additional cost would be 15s., making a total of 75s. each. In practice the check action springs are very likely to be damaged by persons pushing the door open before the check action has finished its work, and thus straining the air check. Another well-known firm of makers supply a floor spring for medium sized doors at 50s., and for heavy doors, 65s., and if fitted with check action, 80s. and 98s. respectively. Springs for single action doors (swinging one way only) would need to have check action and, including the top butt necessary for hanging, would cost about the same as double action floor springs with check. There are so many makers and patterns of floor springs that the small builder will be well advised to get a special quotation on each occasion for exactly what is required.

Example :—

1 double-action floor spring and top centre, and fixing to hardwood door and wood floor—

	£	s.	d.
1 spring	3	0	0
Fixing, say	1	0	0
	£4	0	0
Profit and on-costs, 15 per cent.	12		0
	£4	12	0

The spring makers will send to fix floor-springs, and their charge for this would be approximately 25s. per spring. Spring manufacturers will usually arrange to oil, maintain, and adjust their floor springs at a cost of about 15s. per annum.

The following are a few prices from the British standard list for bright iron wood screws per gross, with countersunk heads (Nettlefolds) :—

Nos.	8	9	10	11	12
Length					
¾″	1 1½	1/2½	1 3	1/4	1/5½
⅞″ & 1″	1 3	1/3½	1 4½	1/6½	1/7½
1¼″	1/5½	1/6½	1/7½	1/9	1/11
1½″	1/7½	1/8½	1.9	1/11	2/1
2″	2/1	2/1	2/2	2/4	2/8

Brass Wood Screws (per gross).

Nos.	8	9	10	11	12
Length					
¾″	2/8	3/–	3/4	3/10	4/4
⅞″ & 1″	3/4	3/8	4/1	4/6	5/–
1¼″	4/–	4/5	4/11	5/5	6/–
1½″	4/8	5/2	5/9	6/4	7/–

The discount varies in accordance with the quantity required, but the present discount is about 30 per cent. off iron screws, and 15 per cent. off brass screw list.

No. 9 screws are usually suitable for 2½ in. and 3 in. butts, and No. 10 screws for 4 in. butts.

[Previous articles in this series, with the dates on which they appeared, are as follows :—Preliminaries, June 29; Brickwork, July 6; Carpenter, July 20 and August 10.]

RATES OF WAGES IN THE BUILDING TRADE.

The following are the rates of wages in the building trade in England and Wales. Every endeavour is made to ensure accuracy, but we cannot be responsible for errors that may occur :—

	Masons.	Bricklayers.	Carpenters, Joiners.	Plasterers.	Slaters.	Plumbers.	Painters.	Brick-Masons' Labourers.	Plas-layers' terers Labourers.
Aberdare	1/7	1/7	1/7	1/7	1/7	1/7	1/7	1 2½	
Accrington	1/7	1/7	1/7	1/7	1/7	1/7	1/7	1 2½

(For rates of wages in the Building Trade in Scotland, see page 344.)

CONTRACTS, COMPETITIONS, &c.

For some contracts still open, but not included in this List, see previous issues. Those with an asterisk are advertised in this number. Certain conditions beyond those given in the following information are imposed in some cases, such as that advertisers do not bind themselves to accept the lowest or any tender; that a fair wages clause shall be observed; that no allowance will be made for tenders; and that deposits are returned on receipt of a bona-fide tender unless stated to the contrary.

The date given at the commencement of each paragraph is the latest date when the tender, or the names of those willing to submit tenders, may be sent in; the name and address at the end is the person from whom or place where quantities, forms of tender, &c., may be obtained.

PROPOSED NEW BUILDINGS & OTHER WORKS.*

In these lists care is taken to ensure the accuracy of the information given, but it may occasionally happen that, owing to building owners taking the responsibility of commencing work before plans are finally approved by the local authorities, "proposed" works at the time of publication have been actually commenced. Abbreviations:—T.C. for Town Council; U.D.C. for Urban District Council; R.D.C for Rural District Council: E.C. for Education Committee; B.G. for Board of Guardians; L.C.C. for London County Council; B.C. for Borough Council; and P.C. for Parish Council.

ABERDEEN.—Plans passed by T.C.: Additions at 138 and 140, Broomhill-road, for Mr. W. Taggart and Mr. J. Brown, per Mr. G. Watt; house and garage, Anderson-drive, for Mr. H. Duncan, per Mr. J. Ellis; house, Queen's-road, for Mr. C. Harper, per Mr. G. Watt; house, Anderson-drive, for Mr. R. L. J. Henderson, per Messrs. Kelly & Nicol; addition to St. Mark's Episcopal Church, Short Loanings, for the Directors, per Mr. A. Murison; additions to auction mart, Powis-terrace, for Reith & Anderson, Ltd., per Messrs. Sutherland & George; garage and workshops at junction of West North-street with Meulmarket-street, for Mr. G. Bothwell; addition to flock factory, Ardarroch-road, for Messrs. J. Rhind & Son, per Mr. W. E. Gauld. Also plan for development of Links Sea Beach, estimated to cost £27,200.

ABERYSTWYTH.—The U.D.C. has applied to the Ministry of Health to sanction the borrowing of £23,065 for carrying out sewerage works.

ALTRINCHAM.—Mr. P. H. Cundall, architect, of "Windyside," Hartley-road, Altrincham, has prepared plans for a detached house in Macefin-avenue, West Didsbury, for Miss Campbell.

AMMANFORD.—Estimated to cost £12,000 to complete the new public hall erection, under Welfare Scheme, will soon be tendered for, site negotiations being advanced nearly to completion.

AYLESBURY.—Plans passed by the U.D.C.: Timber-framed bungalow near Aston-hill, for Major J. M. Pye-Smith; houses at Ford, for Mr. T. W. Wood; Wend-over-road, Weston Turville, for Mr. E. P. Kempster; Station-road, Stoke Mandeville, for Mr. W. G. Ellis; cattle shed at Haddenham, for reconstruction of a cottage at Hulcott, for Mr. A. de Rothschild.

BARMOUTH.—A loan of £5,000 for temporary works to prevent coast erosion is to be sought.

BARROWFORD.—The U.D.C. is strengthening the Recreation Ground River Wall, at an estimated cost of £696. Plans have been approved for a building to be used as a garage for Mr. F. Hully, and a store-house in Richmond-road for Mr. A. Ashworth. It has been decided to fix an iron palisade fence around the new sludge drying works, at an estimated cost of £250.

BELFAST.—Plans passed by R.D.C.:—Thirty additional cottages for ex-service men, near Whiteabbey railway station.

BRETHERTON.—Mr. F. Howard, architect, of Preston, is designing an oak war memorial to be erected in the Wesleyan Church and a marble war memorial to be erected in the Congregational Church.

BRIERCLIFFE.—The Ministry of Health has sanctioned a loan of £4,935 for constructing additional water works.

BURNLEY.—Plans approved at a meeting of the Improvement Committee:—Water tower, Calder Vale Mill, for Messrs. The Calder Vale Room and Power Co., Ltd.; house, Pasture Gate, for Mr. T. H. Grey; two houses, Moseley Hill-road, for Mr. J. Nuttall; additions to "The Grange," Marsden-road, for Mr. J. Stuttard. ——It is proposed to install a new refrigerating plant and alterations to existing buildings at the Burnley Cold Air Stores, at an estimated cost of £8,455.

CASTLESIDE.—It is proposed to build a public hall and institute at Castleside, near Consett, at a cost of £1,250.

CHEETHAM.—Messrs. Matley & Brotherton, architects, of 11, Old Millgate, Manchester, have prepared plans for the reinstatement of premises, 91, Great Ducie-street, and John-street, for Mr. J. R. Steinberg.

CLITHEROE.—Mr. Bleazard, the Council Surveyor, is preparing plans and estimates for repairing Eshton-terrace and Duck-street. The Council are also considering the erection of a bridge over Mearley Brook. The Council have authorised application to be made to the Electricity Commissioners for a special order for a supply of electricity for the town. The Lancashire Electric Power Co. is to be approached.

COVENTRY.—Plans are to be prepared for an enlargement of Nurses' Home at the Infirmary.

DIDSBURY.—Mr. H. Davies, builder, of 13, Hooley Range, Heaton Moor, Stockport, is erecting detached and semi-detached modern houses on a site in Essex-avenue, and Fog-lane. Work on the first pair has commenced.

DUNDEE.—Plans submitted to Works Committee of the T.C.: Adelaide-place, garage for A. Dewar; Albert-street, additions to tenements for Mrs. A. Reid; Bright-street, Lochee, alterations on cottage for David Neave; Dalhousie-road, Barnhill, garage for D. T. Ferguson; High-street, alterations on premises for Louis Meotti; Loons-road, drill hall, &c., for City of Dundee T.A. Association; Murraygate, alteration on shop for Hipps, Ltd.; Strathmartine-road, extension workshop for Wm. Steele & Sons; Taft's-lane, alterations on shed for J. Robertson & Sons; West Park-gardens, garage for J. W. Hunter.

DURHAM.—Plans approved by R.D.C.: G. S. Legard, addition to Bow School, South-road, Durham; Thomas Blackett, cow byre, Shincliffe Colliery; William Lowe, house and butcher's shop, Carrville; A. Hollingworth, addition to house, Neville's Cross; Viscount Boyne, conversion of stables, &c., into golf clubhouse, Brancepeth.

EASINGTON.—The South Hetton Coal Co. have virtually decided to proceed with the erection of 100 houses at Murton Colliery. The Company has requested the R.D.C. to assist them with regard to roads, sewer and water supply.

EASTHAMPSTEAD.—The R.D.C. has given approval to schemes to cost £37,000 for the improvement of district roads.

ENNISKILLEN.—Plans passed by U.D.C.:—Houses to be built under Government loan.

FAVERSHAM.—Plans passed by T.C.:—Pover & Son, alterations and additions to Grosvenor House, for the Co-operative Society; alterations and additions to International Tea Company's Stores.

FISHGUARD.—The Fishguard U.D.C. has passed plans for the erection of bungalow at High-street, for Mr. J. M. Evans.——The Brynymor road widening scheme of the U.D.C. has been sanctioned by the Ministry of Transport, who will make grant.

GLASGOW.—Plans for new bandstands and enclosures at Alexandra and Bellahouston Parks are being prepared. Plans approved: Cottage at Cathcart, for Mr. A. Campbell; addition to buildings in Wallace-street, for Campbell, Achnach & Co., Ltd.; new building for Institute of Accountants and Actuaries, at West George-lane; new building at Trongate, for Corporation; street off Julian-avenue, for Mr. J. C. M'Kellar; housing schemes are to be carried out at Merryplatts (200 cottages), Crossmyloof (276 tenement houses), Whitefield-road (126 houses).

GOSPORT.—Plans passed by T.C.: Lavatories, St. Matthew's Church; bungalow, Testcombe-road, J. E. Jones; cycle sheds to two houses in Privett-road, W. Chandler; motor garage, Brockhurst-road, Tutt & Sons; Privett Building Estate (lay-out), Alverstoke Land & British Co.; alterations to laundry, House of Industry, Alverstone Guardians; house, Grove-road, W. H. Roberts; additions to premises, Elson-road, E. Carter.

GREAT YARMOUTH.—Plans passed by T.C.: House, Marine-parade, Gorleston, for Mr. F. A. Osborns; pair of houses and two houses, Cliff-avenue, Gorleston, for J. Balls & Sons; shop and cottage, High-street, Gorleston, for Mr. C. H. Moger; house, Lowestoft-road, Gorleston, for Mrs. Emms; addition to house, Cromwell-road, Southtown, for Mr. Pearson; timber shed, Southtown, for Palgrave, Brown & Son; vestry to St. Luke's Church, Cobholm, for the trustees; garage, Bermondsey-place, for Mr. W. Field; roof over yard, Dene-side, for the Electricity Department.

HECKMONDWIKE.—Plans passed:—Alterations to shop premises in Westgate for Mr. Martin, and new shop in Railway-street, for Mr. W. Cooper.

HORNDEAN.—The following estimate prepared by Mr. G. C. Vernon Inkpen, F.S.I., for the proposed local water supply, has been forwarded by the R.D.C. to the Ministry of Health for approval: Mains and connections, Cowplain area, £5,724; Catherington, Horndean, Lovedean, and Blendworth area, £10,583; reinforced concrete reservoirs of 100,000 gallons capacity, £1,300; site for reservoirs, £150; pumping station, £1,000; easements, £100; engine and force pump, inclusive of gears and fitting, £1,500; site for engine and force pump, £150; telephone and electrical indicator, £100; clerk of works, £300; engineer's fees and expenses, £1,109; contingencies and charges, £500. Total cost, £22,507.

HOUGHTON-LE-SPRING.—The R.D.C. have provisionally accepted a tender for the erection, by Mr. F. W. Mole, of Chester-le-Street, of twenty houses on the East Rainton site, at a cost of £6,406.——The Lambton and Hetton Collieries, Ltd., are negotiating with the Houghton-le-Spring R.D.C. with a view to obtaining certain land on the Council's housing sites, for the purpose of erecting a number of workmen's houses.

LAUNCESTON.—Plans have been passed for tenement houses to be built with money bequeathed for the purpose, and tenders are to be invited forthwith by the T.C. for their erection.

LEEDS.—Crossgates Municipal Tenants' Association has decided to erect a club and institute in Orchard-road at an estimated cost of £7,000.

LEYLAND.—A faculty has been granted for the erection of a tablet in St. Andrew's Parish Church.

LIVERPOOL.—Plans for 12 new private houses have been passed by the T.C.

LLANDILO.—The Council has put forward a scheme of road improvement to cost £21,000, and the Ministry of Transport has promised conditional grants.——A special meeting of the Council has been decided upon to frame a housing scheme.

LLANDUDNO.—Plans passed by U.D.C.: Lay-out of roads, sewers, &c., at St. David's-road West: new dancing academy and shops, Mostyn-broadway; also plans for twenty-seven new houses.

LLANELLY.—The Harbour Commissioners have leased land to Messrs. Metals Accessories Co., Llanelly, for building of new sidings near to the fuel works.——Statutory notice has been given by the T.C. to acquire land for extensive road improvement and widening works.

MANCHESTER.—Schemes for four new roads, estimated to cost £200,000, are to be recommended to the Council Finance Committee and the Ministry of Transport. The first scheme is the widening of Blackley New-road from Middleton-road to Heaton Park. The second is the continuation of Mauldeth-road, West Withington, to New-road, No. 12, Princess-road Extension. The third will run from a point in Barlow Moor-road, West Didsbury, passing through Hough End Farm, Chorlton-cum-Hardy, and the fourth is a continuation of Withington-road to Road No. 10, near the Alexandra Park Aerodrome. It is anticipated that the schemes will provide work for about 1,000 unemployed men for 35 weeks, and is in addition to works recently recommended by the Highways Committee as suitable for relief works, estimated to cost £67,000.

OBITUARY.

The death has occurred in a nursing home of Mr. Thomas Charles Jones, aged 57, managing director of T. C. Jones & Co., Ltd., of Shepherd's Bush, and for seven years a member of the Hammersmith Borough Council. Councillor Jones was an active worker in Hammersmith for upwards of twenty years. He was a Freeman of the City of London, Past Master of the Unity Lodge of Freemasons No. 1,637, Committee Member of the Shropshire Society in London, Trustee of the Bishop King's Charities, Chairman of the North Hammersmith Unionist and Conservative Association, President of the Shepherd's Bush Athenæum Club, No. 1 Life Member of the Regent-street Polytechnic.

The death is announced of Mr. John Corfield, of Belton-road, Whitchurch, Salop. He was formerly a well-known builder and contractor.

The death of Mr. Alfred Roper, builder and contractor, of Wellington, took place recently in the age of 75. He had been in business in the town for many years, and carried out numerous contracts in the district, including the building at the top of Queen-street for the United Banking Company (now Barclays Bank).

The death has taken place at Bideford, at the age of 78, of Mr. Edmund Ellis, a well-known North Devon builder.

TRADE NEWS.

"Bigger Business," the house organ of the Wylplug Co., Ltd., Gloucester House, Cromwell-road, London, S.W. 7, a copy of which is to hand, is a bright little publication to be issued monthly. It contains many useful hints for business men, and copies will be sent to firms requiring them.

Visitors to the Shipping Exhibition, Olympia, which opens to-day will find an instructive series of demonstrations on Stand No. 17, Row C, occupied by Messrs. Wailes Dove Bitumastic, Ltd., of Newcastle-on-Tyne, the sole manufacturers of "Bitumastic" preparations. Visitors will witness "Bitumastic" successfully withstanding acid, refrigerating, and boiling water.

PROPOSED NEW BUILDINGS, &c.

Continued from p. 347

Mr. F. Fenn, architect, of 11, Chapel Walks, Manchester, has prepared plans for the conversion of a house, 424 Moss-lane East, into flats for Mr. R. M. Roberts. Mr. G. Westcott architect, of 13, Bridge-street, Manchester, has prepared plans for alterations to premises, 103 and 105, Stretford-road, Hulme, for Mr. A. Horwick. Mr. J. Thomason, architect, of Mosley-street, Manchester, has prepared plans for alterations to premises, 71, Fairfield-road, Openshaw, for Mr. J. Wilkinson.——The T.C. is considering a scheme, estimated to cost one million sterling, for a new road into Cheshire, via Northenden. Several bridges would require to be built.

METHLEY.—The U.D.C. is erecting 12 houses at an estimated cost of £6,451.

MIDDLETON.—Plans have been approved for detached houses in Manchester-road, Alkrington, one of which is being erected by Messrs. J. Middleton & Co., contractors, Shaw, near Oldham, and one by Mr. Robert Taylor, contractor, of 105, Manchester Old-road, Middleton, who have just commenced work on the foundations.

MONMOUTHSHIRE.—The County Education Authority has given formal notice of intention to build a new elementary central school at Lawn House, Rhymney.

MORLEY.—Tenders are being invited shortly by Mr. L. C. Hurst, architect, for a new bakehouse at Hungerhill, for Mr. Colbeck.

MORPETH.—The R.C. are proceeding with their original sewerage scheme involving Widdrington, Ulgham, and Chevington East, at an estimated cost of £19,500. Work is to be commenced immediately.

NELSON.—A sub-committee of the County Council has made the following recommendations with reference to new secondary school at Hole House to the County Higher Education Sub-Committee:—That 11¾ acres of land be acquired, and that a building to provide accommodation for not less than 400 pupils be erected.

NEW MILLS.—Father Prendergast, priest of St. Mary's Roman Catholic Church, has inaugurated an important forward movement for restoring the church, building a new presbytery, and establishing a young men's club. The estimated cost of the scheme is £3,000. No architect has yet been appointed.

OLDHAM.—The E.C. is considering the erection of a new elementary school on a site in Ward-street, and also a scheme for a proposed day open-air school.

OSSETT.—Plans approved by the T.C.:—Four cottages in Back-lane, for Mr. Abraham Pollard; warehouse at Flushdyke, for Mr. J. H. Nettleton; pair of houses at Gawthorpe, for Mr. J. W. Harrop; detached villa in Sunnybank-street, for Mr. John Child; bungalow in Sunnybank-street, for Mr. Albert Pollard; paint shop in Prospect-road, for Mr. J. W. Cudworth; house in Dewsbury-road, for Mr. P. Ward; additions to South Ossett Working Men's Club; and three scullery houses in Church-street, for Mr. Robert Spurr.——The Ministry of Health has sanctioned the borrowing of £2,000 for new water mains and extensions to mains, also for £1,128 for laying a new 6 in. water-main from Gawthorpe to Warneford-avenue. The Education Committee propose to erect new elementary school at Gawthorpe with proposed accommodation for 500 children.

OSWALDTWISTLE.—An inquiry was conducted by the Ministry of Health at the Oswaldtwistle Town Hall, into the application by the Council for sanction to borrow £4,366 for works of sewerage in the village of Knugden, £2,810 for the laying of water mains, £3,500 for the conversion of conservancy closets into water closets, and £1,700 for works in connection with Rhyddings Park. There was no opposition.

PEMBROKE DOCK.—The U.D.C. has in consideration the building of concrete wall near St. Patrick's Church, the improvement of Croft's-terrace and Belle Vue-corners, and widening of Ferry-lane.

PICKERING.—Plans passed by R.D.C.: New institute (Ald. Twentyman).

PONTYPOOL.—It was reported to the U.D.C. that the Pontypool Athletic Association was anxious to be allowed to spend £2,000 on laying out tennis courts and bowling greens at Pontypool Park. A further sum would be available from the Miners' Welfare Fund. The Council decided to urge the Park Management Committee to allow this to be done. Mr. D. C. Udell is secretary of the Association.

PONTYPRIDD.—The Territorial Association is to build a new hall to replace that destroyed by fire a year ago. Plans are nearly completed. The adjutant is Capt. T. O. Jones, 5th Batt. the Welsh Regt., Pontypridd.

ROYSTON.—Plans passed by U.D.C.: Cottage, Mr. J. H. Mann; addition of kitchen to a house, for Mr. W. T. Dobbs.

RUISLIP-NORTHWOOD.—Plans passed by U.D.C.:—Shop premises, High-street, Ruislip, for Mr. H. E. Clark; lay-out Field End Estate, Field End-road, Eastcote, for Telling Bros., Ltd.

RUSHDEN.—Plans passed by U.D.C.: Extension of power station of the Rushden Electric Light Co.

RUSHOLME.—Mr. E. D. Sherlock, architect, 6, Ashlyn-grove, Fallowfield, has prepared plans for a garage to "Hazeldene," 178, Wilmslow-road, for Mr. H. Plummer.

RUSKINGTON.—The Ministry of Health has sanctioned the borrowing by the U.D.C. of £2,640 for the new housing scheme.

SAFFRON WALDEN.—Plans passed by T.C.: House, for Mr. H. A. Cornwell; house, for Miss E. G. Bowles; chimney shaft, for Mr. W. Elsom.

SCARBOROUGH.—Plans have been approved for the erection of two houses, Esplanade-road, Scarborough. Mr. F. W. Plaxton, Castle-street, Scarborough, is the architect.——The Borough Engineer has been instructed to submit plan and estimates for a new public hall. A loan of £34,156 for protective works on the Royal Albert Drive has been sanctioned. Plans and estimates for the construction of roads and sewers on the Prospect Mount Estate are to be prepared.

SHEFFIELD.—Plans have been approved for the erection of a new Secondary School at Osgathorpe Hills, Pitsmoor, with accommodation for 800 Catholic scholars, to be called De La Salle College. Brother Dunston is the headmaster. No contracts have been placed.

SLEAFORD.—The U.D.C. propose to extend their electricity mains at an estimated cost of £2,000.

SOUTHEND-ON-SEA.—The Town Hall Committee has been instructed to submit a scheme for the provision of a town hall; a new justices' room and petty sessions house is to be erected, at a cost of £5,500; the T.C. is seeking sanction to borrow £6,173 for re-surfacing London and Southchurch-roads and £3,990 for re-surfacing Marine-parade.

SOUTHPORT.—Plans have been prepared by Messrs. Lumb & Walton, architects, 16, Clifton-street, Blackpool, for the rebuilding of shops and offices for Messrs. Rawcliffes, Ltd. Tenders are being invited.

STAFFORD.—A site has been obtained in Marsden-road for a new Roman Catholic Church, and £2,000 has been raised towards the cost, but no architect has yet been appointed. The Rev. D. Kelly is the priest in charge.

STAINFORTH.—The U.D.C. propose to erect 170 additional houses, the first instalment of 50 to be put in hand at once.

THORNABY.—Plans passed by T.C.: Bungalow, Thornaby Green, Mr. A. McLeod; improvement to Dockway Sugar Mills, Messrs. W. & M. Pumphrey.

TYNEMOUTH.—In connection with their slum clearance, Tynemouth Corporation are inviting tenders for the erection of three blocks of tenements within the borough.

USK.—The occupier of Tenby House, Old Market-street, has submitted plans to the U.D.C. for erection of a shop.

WAKEFIELD.—A scheme is afoot for constructing a new infectious diseases hospital, to the plans passed in 1914. The matter has been referred to the T.C.'s General Purposes Committee. Additional land (68 acres) is to be purchased by the T.C. for the erection of working-class houses. Plans approved include house, Belgravia Mount, for Mr. J. Auty; 12 houses in Agbrigg-road, for Mr. T. Ibbottson; house in Horbury-road, for Mr. S. H. Charles; house in Horbury-road, for Mr. W. L. Jackson; five houses in Pinderfields-road and Selby-street, for Messrs. Kilkenny Bros.; house in Carr-lane, for Mr. C. J. Crocker; house in Horbury-road, for Mr. E. Billcliffe; house in Belgravia-road, for Mr. D. F. Martin.

WANDSWORTH.—Plans prepared for B.C.: Library, for Earlsfield; swimming bath, for Streatham. (Aggregate cost, £200,000.)

WESTHAMPNETT.—The R.D.C. is seeking a total loan of £17,588 for road works.

WHITBY.—Plans have been approved for the erection of a new band pavilion, "The Spa," Whitby. Mr. C. M. Blanchard, the local Surveyor, is the architect.

WIGAN.—Plans approved by the Improvements Committee: Two houses, Wigan-lane, for Messrs. Darbyshire & Jackson; house, Wigan-lane, for Mr. Thomas Ormerod; alterations to the "Freemasons' Arms," Warrington-road, for the Oldfield Brewery Co., Ltd.

WOKING.—Plans approved by U.D.C.:—Mrs. Witham, detached house, Prey Heath-road, Worplesdon; E. Ricks, detached house, Pembroke-road; W. G. Tarrant, Ltd., two detached houses, Hockering Garden Estate, off Park-road; W. G. Tarrant, Ltd., detached house, Hockering Garden Estate, off Park-road; Major Holbourn, detached bungalow, Kingsway-avenue; F. Aylott, four detached houses, White Rose-lane; H. M. Wyatt, detached house, Horsell Park Estate; Mrs. Roche, detached house, Fletcher-road; E. Ricks, amended plans to those approved on April 17 for a bungalow on Highlands Estate, Westfield; Dr. R. Thorne Thorne, addition to consulting room at "Greenhayes," White Rose-lane; H. C. Allen, first floor addition to the "Wishel," Pembroke-road; Embersons, corrugated iron store at the rear of premises at Chobham-road; A. B. Jones, garage at "Southfields," Woodham Rise; E. A. Cook, new boiler house of galvanised iron at Laundry, Step Bridge-path; S. W. Colman, wooden garage in connection with house, Waldens-road; Dr. Davies, garage, the "Dell," Goldsworth-road; — Owens, drainage of "Edgeware House," High-street, Knaphill.

WHITE CEMENT STUCCO

White cement stucco, which is used to a considerable extent in the United States, has been made the subject of a series of films, taken in America, showing the many uses of "Atlas" white cement stucco. This film was shown on Tuesday morning at the private theatre of Jury's Imperial Pictures, Ltd., Tower-street, St. Martin's-lane, W.C., and Mr. Frederic Coleman explained the many applications of the material. Among other things the views showed the textual finishes, whiteness, and durability which may be obtained with this stucco on the exteriors of buildings, and Mr. Coleman pointed out that a notable example of stucco work in London was the new Tivoli Picture House in the Strand.

On September 20, at 10.45, a more elaborate series of films illustrative of stucco work will be shown at the West End Cinema, Coventry-street, to which architects and others interested in building construction are invited. Tickets may be obtained on application to Mr. Frederic Coleman, Regent House, Regent-street, W.

*J. J. Binns £3,316

PORTSMOUTH.—Four electric refuse vehicles :—
*General Vehicle Co., Ltd.

PORTSMOUTH.—For additions to Regent Cinema, London-road. Mr. A. E. Tutte, architect, 38, Commercial-road, Portsmouth :—

L. & A. Sprigings	£398
A. E. Porter	379
John Lay & Co.	348
F. J. Privett	347
Tanner Bros.	299
*J. Crockerell	294

SCARBOROUGH.—For the erection of 12 houses on the Edgehill Park Estate, for the Corporation :—
*Anthony Lyons, Malton £5,584

Note.—The M.H. decline to sanction acceptance of this tender, but Corporation propose to claim subsidy of £75 per house.

SOUTHEND-ON-SEA.—Supply of cast-iron pipes, &c., for Leigh West Sewage Works, for the T.C. :—
*Stanton Ironworks Co., Ltd., Nottingham £1,771 12 1

For 15-in. syphon and 10-in. overflow pipe for Leigh Sewage Works, for the T.C. :—
*Thorby & Matthews, Southend £3,933 1 11

Re-surfacing main road with bituminous material :—
*Whitehall Asphalt Co., Ltd., London, 9s. 5d. and 9s. 7d. per yd. super (with five years' maintenance at 3d. to 5d. per yd.).

Making up Fairfax Drive (Sec. 6) :—
*Iles £705

South View Drive :—
*Iles £2,120

Porter's Grange-avenue :—
*Iles £1,610

Grange-gardens :—
*Iles £830

Lime-avenue :—
*Abbott & Haddington £2,324

Eaton-road :—
*Abbott & Haddington £264

SOUTHEND-ON-SEA.—For work in connection with Council schools :—

Wrought iron (5ft.) fencing—
*Armstrong & Main, Ltd.—11s. 6d. per yard.

New boiler at High School—
*Watkin Heating Co., Southend, £165.

Wrought iron fencing for Memorial Ground—
*Bayliss, Jones & Bayliss—14s. per yard.

Gates—
*Bayliss, Jones & Bayliss—£8 10s

THOMER.—For the erection of a village Victory Hall :—
*W. J. & R. Turnbull, Leeds (all trades)

WORSBOROUGH.—For erection of 22 houses, for the U.D.C. :—
*Oakland & Co., Wombwell £8,250

WORSBOROUGH.—For sewer work at Kingwell :—
*Rawson Porter, Worsborough £392 6

THE BUILDER

JOURNAL FOR THE ARCHITECT AND CONSTRUCTOR

WITH WHICH IS INCORPORATED "THE BRITISH ARCHITECT."

OL. CXXV.—No. 4205. SEPTEMBER 7, 1923

THE HOUSE WE OUGHT TO LIVE IN.

DESPITE the protests of some enthusiasts of the simple life, ordinary civilised people still regard houses as at least provisional necessaries until such time as the perfection of the institution system of Utopia has offered an alternative form of protection the elements. As a matter of present-day fact, people g in England are often required to live in houses or to ess a good reason for not doing so. Tents and huts are e to be visited by District Surveyors, and orders for demo- n may follow where the accommodation is not considered onform to some standard of quality. "The house we t to live in" is therefore no idle phrase and the disappoint- of many individuals, who have recently suffered ejectment temporary huts erected in the emergency of the house tage is evidence of the practical compulsion residing in word "ought." The whole system of building by-laws, far as they refer to domestic buildings, is based upon the mption that people live in houses, and that those houses t to be fit for habitation in accordance with some recog- l view as to what constitutes fitness. The by-laws of rent districts naturally exhibit divergencies of opinion n this point, for although they often resemble those in in the neighbourhood of London, the personality of each inistrative official also plays a part in their interpretation ctual erection. The surveyor's opinion also must coincide ome extent with that of the local authorities or the legal aratus fails to perform its task of preventing the erection nsisting upon the demolition of undesirable dwellings.

exatious as many people profess to find the restrictions nglish building laws, the houses produced under their mild pulsion are only possessed of certain elementary safeguards gard to sound construction, resistance to fire or damp, some ary accommodation and a modicum of light and air. ic health is consulted in the matter to a negative rather to a positive degree. The freedom of the subject is a l tradition, and the by-laws generally stop short with enting the intending building owner from causing immediate is and obvious damage to his neighbours. What damage ay do to himself or to the unfortunate people who may after him, in badly-designed, toil-creating houses, does et come under the control of the law or even of public on. The Englishman's house is his castle, and if the al arrangements are antiquated and gloomy that is ed as part of the necessary price of freedom. It is y's business to dictate to us Englishmen the sort of we ought to live in. Under this privilege of being allowed ft, houses are still being erected with all the impedimenta l-destroying drudgery that town-planners, architects and sts have been endeavouring to eliminate from the face land. Long, lightless passages, sunless north rooms, of front steps, those abominations of Victorian building, excusable in the restricted space of a town frontage, are ng repeated in too many of the domestic buildings now put up on open sites by private owners within twenty f the Metropolis.

e houses exhibiting these or similar ineptitudes of design we suppose, have been put up without assistance properly qualified architect; they must, however, in st majority of cases, have passed the scrutiny of the surveyor. To affix the seal of official sanction to a plan ill misapply the savings of some poor man's lifetime, to know that a few days spent in competent revision would set matters right, and to have no authority even to suggest such a revision must tax the competent surveyor's patience. The proposal to establish a staff of expert plan-revisers, either attached to or independent of the District Surveyor's office would not meet with any great measure of approval in these economical days, even if future politics should drift in this direction.

One method of obtaining the house we ought to live in is to appeal to popular opinion through the avenues of literature and publicity, but here the difficulties are greatly increased by the disinclination of the public to read what is written concerning architecture. So rooted is this dislike that we have heard of lecturers being advised by their agents to omit the hated word architecture from the announcement and substitute some alternative title for their lecture on the plea that otherwise no audience will be forthcoming. Perhaps it is the last thing that even architects learn that the training necessary to make a house practical is harder and demands more serious concentration than will suffice to make it artistic. Magazines and books dealing with house design and construction may be seen on the bookstalls, and there is evidently some sale for them, but they frequently suffer from two opposite defects and are either far too technical to be readable or are so diluted for popular consumption as to fail to indicate the serious nature of the problem. The vocabulary of architectural terms is awkward in that so many of them are foreign and have never been fully incorporated into normal English speech. In a book we notice on page 369 the authors have steered a middle course among these difficulties and their book contains much that is admirable and suggestive in the way of improved planning expressed in a thoroughly lucid and readable style. Their sustained attack upon the problem of house design from the point of view of efficiency in every detail should bring home to their readers the fact that architecture does not consist in placing so many rooms in the first order that suggests itself, or, on the other hand, in torturing the necessities of the case to accommodate preconceived features without reference to sound economy or common sense. The authors' incidental passing reference to the house as "an instrument of rest or recreation" hardly does justice to its chief function as a nest for young human beings; but their treatment of their subject is, in other respects, thorough and serious. Throughout the book domestic architecture is discussed from the scientific rather than the artistic standpoint, though it becomes abundantly clear that art would be no loser if this method of approach were more usual.

Another method of directing attention to the question is by competitions among architects, and the designs submitted in the recent Cost of Building Competition promoted by this journal showed that some architects had mastered the elements of efficiency in planning. Criticisms of the winning designs which appeared in these pages also showed appreciation of practical points, but sometimes failed to recognise the necessary limitations involved in planning to a specified first cost, or, as in the actual competition, to a certain rental value.

Whatever may happen in the future, the house we ought to live in at the moment has often to be identified with the house we can afford to pay for. Efficient planning will make a given outlay of money purchase more convenience, but no expense of brain-power can stretch the accommodation beyond a certain maximum for any specified sum.

NOTES.

Monotony in Building.

A CORRESPONDENT complains of the sameness and "appalling monotony" of new London buildings "with scarcely any individuality," and wonders whether this is a sign of "modern progress." While in certain directions this criticism may be true, it is hardly to be described as progress, and we should certainly welcome a more personal intimacy of approach; something a little more lighted by nature and feeling. But these are not paramount influences in commerce, and it is not therefore surprising that new buildings now arising in the streets of London, mostly for commercial purposes, should reflect commerce more than art. After all, it has been said "By their works ye shall know them," and the character of the bulk of advertisements on our street hoardings reveals the outlook and sensibility of the advertiser no less than the character of many of the buildings rising in the streets of London reflects the commercial aims of those who occupy them.

Art in Industry.

ANY fairly comprehensive survey of this subject reveals to the observer much that is encouraging. New and better influences are piercing through the accustomed views which dwelt so much on machinery and vague aspirations. The source of this encouragement proceeds from a recognition of other needs, of another kind of organisation. Encouraging art on the old theoretic lines is seen now to be a very difficult thing in itself; one, in fact, so difficult that the tendency is growing to take up the whole matter from another angle of vision, freer from the control of exhibitions, schools, "critics and curators"—and the guidance of commercial motives. For the motives which we have assumed to animate men, and to which, therefore, it has become customary to appeal, are becoming less important to us. The sections of opinion which have hitherto been dominant are now being wholesomely challenged. As a writer states in a contemporary: "The artist has looked to shows and schools, to critics and curators, to the patronage of the rich, and to association with commerce," but, he pertinently adds, "the one thing he has failed to establish is his status as a workman with a programme of his own creation." This appears to us a better object than his former dependence on entangling associations. We must not be governed, much less driven, by commercial motives; moreover, as the result of much testing we find they do not work. The manufacturer's zeal for better design is compromised by this—as it appears him—necessity, and also by the mistak notion that the public "will have wh they want." When we cease to wr down the virtues of the public in this w we shall be freer to make the best use our own.

Madonna and Child, by Mino da Fiesole, at Florence.

The Public and Art.

OF the many shibbolet with which our time h doped itself, none has be more harmful than the loading of our responsibilities on public as though it were some separ entity, and we were not part of that v public ourselves, so leading our thoug all astray. It is ever a poor act to pl the blame on other shoulders; health if we look for where we ourselves are blame. More often an excuse than argument, it has palliated most of bad work that gets itself done, and is most fruitful source of failure. As matter of fact, the public—the multitu—are acceptors chiefly and take what given them, and if we have someth better to offer them they will accept t too. The manufacturer is a citizen bef he is an employer, and when one of the in a letter to *The Times*, complains th "it is not the manufacturer's fault if public will have what they want," states the true cause of the lack of art industry—which is a lack in the ma facturer himself. It is encouraging, h ever, to find a growing recognition of t and that an improvement of art in ind try cannot be accomplished through h truths.

Protection of Open Spaces.

EACH year as the sum comes round complaint made of the disfiguremen the countryside thro waste-paper and the other concomit of holiday-making, and it is really which is very regrettable in a presum civilised people. To leave this wak disfigurement is a great reflection those who are responsible for the offe Drastic action has been recommen but it is difficult to see in what way it be effectively taken. In Kew Gar the provision of baskets set about grounds into which visitors can put empty bottles, &c., has mitigated the and their presence also suggests to vis the disregard for the general welfa the neglect to use them. Perhaps addition of notices against objectio habits, as in the railways, would further to mitigate the evil. P requests not to "walk on the g are respected, and we are inclin think that with more attention to the matter in such ways improve should be expected. Considerati expense offer objection to the f proposal that open spaces and "bea spots should be better patrolled. Th taste and public spirit of the p if directly appealed to, is, we thi

elied on, for it is more from want of ght than anything else that the ect of these decencies of the common still prevails so much.

ızes at mpeii.

An account from the pen of Professor M. Rostovtseff in the *Times* of his archæological investigations at Pompeii ıls information in reference to the rations which its dwelling houses ded. The Strada dell' Abbondanza, h extends from the Forum, one of principal streets, reveals particulars gard to the decorations included in dwelling houses of extraordinary est. The mural work of these under- nd rooms represents the art of the ıstan period, when the subject matter rated was mostly drawn from famous des in the Iliad, though we are told landscape predominated. One parti- r room described by the Professor ıs to have more directly illustrated Homeric poems. A comment about e mural paintings, &c., illustrates an ct of wall painting which belies that modern and theoretic view of the ssity of "flatness," for fear we should et we were looking at a wall—a view h has fostered in our own time such ttenuated expression, and so limited cope. As stated in the course of a er on the subject in the same journal: ıe artists' primary object seems rather ave been to paint landscape than to trate Homer, and to create as part of architectural plan the illusion of lows looking out upon Nature." much more interesting than the t" pabulum, the studio substitute! rentions such as these are the growth reconceptions little related to practice, when the practice of mural painting takes hold of our artists, as well as art schools, they will not be content to hold the richness of real painting ity, or fear lest the spectator should know a wall when he sees it.

ubject tter at mpeii.

There is another consideration of much importance illustrated by the particulars furnished by Professor Rosseff about these Pompeiian decora- . We are experiencing a very ral reaction from the over-conven- l, and jejune subject matter of late eenth-century painting, in regard- anything outside of the mundane l as suspect. But though the fried- Lop, the purveyor of Bury puddings, roundabouts and swings furnish a tly legitimate and more robust native, we are a little too ready to de other subject-matter of more ental character, anything which does answer to what we consider to be But the account of the leading out nting, as suggested by the description ave quoted—"windows looking out Nature"—opens the way to a more

Panel at Rimini Cathedral.

transcendental world, one in which the mind is turned once more from the more pedestrian objectives for art to those which enclose the whole being.

The Collector.

Mr. Philip Guedalla, in "Masters and Men," portrays for us the collector:—"It is an odd, industrious little figure that goes about, in his favourite phrase, picking things up. There is something faintly perverted about many of his preferences. You will find him, in the dark corners of bookshops, buying books for their misprints. He has been seen admiring prints because of some error that remained uncorrected on the plate. The fatal lure of rarity obscures for the collector the facile charms of perfection. It is enough for him (one is back again in the era of the two-headed lamb) that the specimen is unique. The collector, scavenging indomitably in the wake of our civilisation, will leave nothing whatever for posterity to find."

The City Churches.

Some pertinent questions in connection with the proposal to demolish a number of Wren's City churches are raised by a correspondent. "I note the renewal of the menace as regards the City churches," he writes. "They are to be sold to supply funds to erect new churches in the suburbs. Are the suburbs so thirsty for spiritual consolation? Ask them. The local clergy tell me that they cannot fill their churches as it is, and matters are getting steadily worse in this respect. What would the City look like without the churches? A sad sight. I know you will use your most powerful influence against this speculation."

Payment by Results.

We should surely all agree that the prosperity of the building trade is not a matter for the concern of builders or operatives alone. We are all more or less concerned in the right development of the building industry, and we can only hope that the suggestions on payment by results (see p. 379) will be carefully considered and acted upon in some feasible way. Payment by results should not be an impossible ideal to attain. We believe Mr. Chessum is right in saying that the workers in the building industry are in favour of payment by results, providing there is a sufficient guaranteed wage below which their earnings will not fall, and also with a proper security against rate cutting. With such a protection for all, why should not the industrious be permitted to receive payment for his extra labour?

GENERAL NEWS.

Professional Announcements.

Mr. Frank A. Coyle, M.S.A., architect and surveyor, has removed from 1, West-parade, Consett, to 29, Newmarket-street, Consett.

Mr. Thomas Adams, of the firm of Thomas Adams & Longstreth Thompson, town-planning consultants, 121, Victoria-street, Westminster, has been appointed Chief Consultant to the Committee on the Plan of New York and Its Environs. The plan of the Committee deals with an area of 5,220 square miles, having a population of about 9,000,000. The acceptance of the New York work will not affect the English practice of the firm.

Technical Courses.

The 1923–24 session of the London County Council Central School of Arts and Crafts, Southampton-row, W.C.1, opens on September 24, the autumn term ending on January 31, while the spring term is from February 1 to June 28.

The University courses in the Municipal College of Technology, Manchester, will re-open on October 4 and end on July 25.

Obituary.

Mr. C. Frederick Wilkinson, retired architect, of Hyde Park, who has died in Leeds, designed and altered a number of the buildings at the Bramley Poor Law Institution, and was responsible also for the Old Field-lane Methodist Chapel. The son of the late Rev. C. Wilkinson, pastor of the Holbeck Unitarian Chapel for twenty years, Mr. Wilkinson in former days took a keen interest in cricket and angling.

A Spire in Danger.

The spire of St. Mary's, Shrewsbury, is threatened with destruction. In 1894 the top of the spire fell, and it cost £7,000 to repair the damage. Now it is the Norman tower and the lower portion of the spire which are in danger. The sum required for the restoration is £5,000.

St. Nicholas Church, Wrea Green.

The Birley family have decided to present a reredos and altar to the Church of St. Nicholas, Wrea Green, Lancs, in memory of the late Mr. Hutton Birley. The design, in painted oak, has been approved by the Church Council of the Manchester Diocesan Architects' Committee, 90, Deansgate, Manchester, and, when a faculty has been granted, the work will be proceeded with.

Anthracite Stoves.

Mr. H. Tieling Smith, at a Rotary Club luncheon at the Hotel Cecil last week, made it clear to users of anthracite stoves that a recurrence of the explosions which took place last winter is not likely to happen in the future. He explained that a committee had been appointed by the colliery owners to inquire into the matter, and they had made exhaustive inquiries and experiments, and declared that such precautions had been introduced in all anthracite pits which made it impossible for explosions such as were experienced to happen again in the future. Any explosives used would be of such a nature that it would disintegrate and be quite harmless, if by any chance it became mixed with the coal. Anthracite, he stated, gave a much higher percentage of heat than any other coal, but it could only be burned advantageously in closed stoves. Mr. Smith demonstrated and explained some of the experiments which had been made with a stove he had at hand for the purpose.

COMPETITION NEWS

Armstrong College, Newcastle-on-Tyne, Library Competition.

Mr. H. M. Fletcher, M.A., F.R.I.B.A., has made the following award in this competition :—First premium, £100, Mr. A. Dunbar Smith, F.R.I.B.A., 6, Queen's-square, Bloomsbury, W.C. ; second premium, £75, Mr. W. G. Newton, M.A., F.R.I.B.A., 4, Raymond-buildings, Gray's Inn, W.C.1. ; third premium, £50, Messrs. Mauchlen & Weightman, 2, Collingwood-street, Newcastle-on-Tyne. The approximate cost of the building is £25,000. The drawings are on view to-day (Friday) and will be exhibited again on September 27, 28 and 29, from 10 to 5 p.m., at Armstrong College.

The first premiated design is given in this issue.

Manchester.

The Manchester War Memorial Commi has decided to accept the design of Sir Ed Lutyens, R.A. The new Cenotaph at Manc ter will be 36 ft. high, and will be flanked two obelisks each 24 ft. high.

Southsea Common Lay-out Competition.

The conditions of this competition are no accordance with the Regulations of the R.I.B and members are advised to take no part in

Manchester.

Messrs. The D.I.C. House (Cross-street), L of 16, John Dalton-street, Manchester, h invited a certain number of architects to sub designs for a new building in Cross-str Professor C. H. Reilly, F.R.I.B.A., is assessor. Sending-in day, October 15.

Cottage Hospital.

South Moor and Holmside Collieries' Welf Scheme Committee invite plans and specifi tions for their proposed cottage hospital, wh is to have two wards, capable of accommodat 20 beds, at a total cost of £10,000, includ furnishing.

Chiswick.

FOR THE U.D.C.—Designs for construct and laying-out a river embankment. Premiu 100, 50 and 25 guineas. Sending-in d October 15. Further particulars from Clerk to the Council, Town Hall, Chiswi *Banned by R.I.B.A.*

Other Competitions.

Other competitions still open include t following (the dates given are, first the sendi in date, and second the issue of *The Builder* which full particulars were given) :—Singap College (Jan. 1, 1924; March 30). Hull A Gallery (Nov. 5; May 4). Mint competit for plaques (Sept. 30; May 25). Birmingh Masonic Temple (Sept. 12; June 22). Col scheme (Sept. 30; June 29). Memorials to Missing (Jan. 1, 1924; Aug. 3). Halifax L out—*Banned by R.I.B.A.* (Oct. 1). Swan Masonic Hall (Oct. 3). Eastleigh and Bish stoke Assembly Hall (Aug. 24).

Royal Academy Exhibition, 1923.

MR. E. W. COLDWELL, Lic.R.I.B.A., Architect. (*See p.* 357.)

THE COMPLEAT ARCHITECT.

By DUDLEY HARBRON.

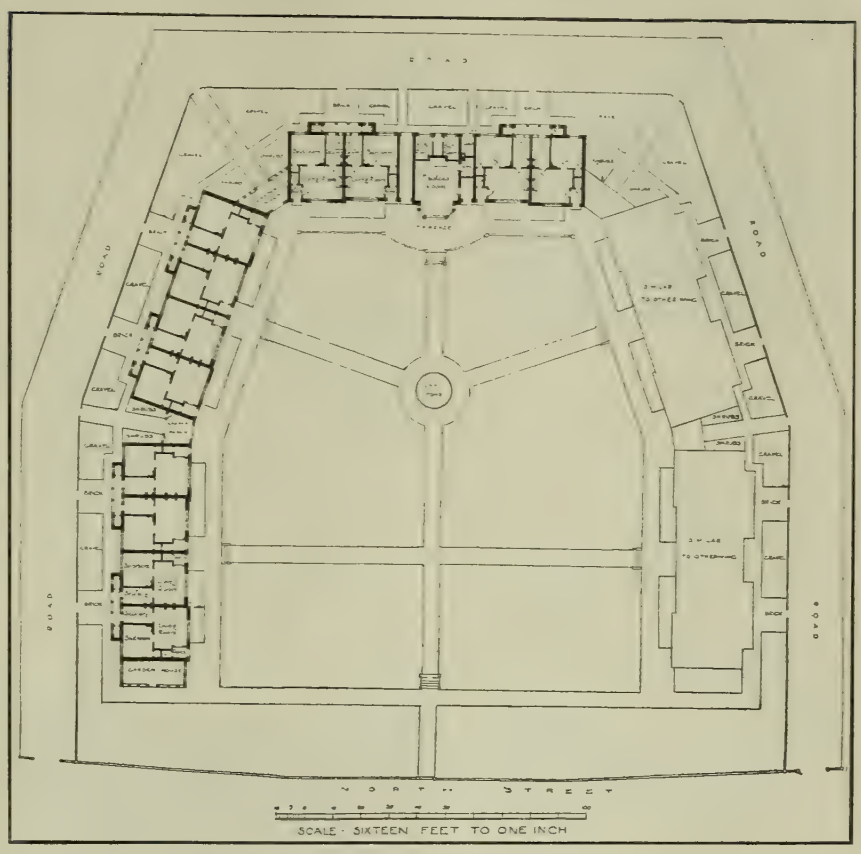
VIII.—CONVERSE.

In one of the issues of the *Tribune*, a daily per, unhappily defunct, there appeared a ort story entitled "The Monkey Tree," by dyard Kipling. I remember hardly anying about the story as a story, but I seem recollect that that distinguished writer tempted incidentally to do for a house the rt of thing which he has done for engines, idges and boilers; that is, to toy familiarly th the working parts. Even he did not nture far into the intricacies of the building ssary.

I do not wish to labour the point, but does not need an architect, a builder, or an erative to put in their right places all the tle details of finish, workmanship and aterial that cluster round the occupation of eating an edifice? In talking to each other, d to and with workers in the same calling, e can use a language that amongst relatives uld appear affected, whereas between ourlves it is quite natural and useful. True, e technical vocabulary breaks down now and en, and perforce we have to make use of ugh English, to help us characterise mouldgs with "too much belly," and mixtures hich are "fat" or "thin." But the applition of these adjectives in their respective ses remains a secret not overheard by the blic ear. All other callings worth the name ve a kindred symbolism that is Greek to the tsider.

When we can talk freely in this jargon of r calling we may be considered to have ssed through the initial novitiate state, to genuinely interested, absorbed, and merged th and into the profession. We no longer ll plans elevations or elevations plans, as the Philistines. An architrave for us has definite significance. A floor is not exactly hat it appears upon the surface, but someing of depth as well as breadth, with an derside of filling, sleeper, or ceiling.

In my youth, I remember, I spoke of paints." I was very young. I was sharply rrected by a voice (now professorial), Colours." I have never forgotten that tial transition from the boilermaker's outk to that of the architect. Nor do we make suddenly, unless we keep our mouths shut d our ears open for a very long time. We come inoculated by contact. Unification d to be attained by a rather rough method. Who is the greatest architect of the day?" ere was only one answer. An illustration Scotland Yard framed upon the wall gave a hint. If you were bright enough to take you were "Welcome." If too obtuse then Good-day." This brusque sort of consation has its merits, not only in separag the sheep from the goats, but in distinshing the interested from the amused.



There are not wanting a disgruntled set of tics, who object to the language of art. ey believe in calling spades—spades. ough to a spade-maker that simple tool st consist of a hundred and one parts, detions, and attributes. It is a complicated ce of mechanism, into the very interstices which he has delved as only a spade-maker uld. I do not object because I cannot ow him. It is only when language obres the conception instead of elucidating t the critics' complaint is justified. Let critics simplify their language if they st; indeed, the composition of their tience renders it imperative, but leave us refinements, our feeling of them in profile perspective. Granted that there are es, and that he who oversteps that to ch he has attained is presumptuous. The ney along the road is full of incident, and further we travel the more interesting s it become.

is a phase of art that does not enter into news, because the full discussion of technical matters has not a broad enough appeal and takes up too much space. Thus the valuable acquirement of being able to do so in words can only be gained in conversation. Only the individual who devised the member can fully detail why. If he cannot, and at the same time convince his auditors of its rightness, there must be something wrong somewhere. The creator should be able to explain his creation. If we cannot talk about these things, there must be precious little to say. No amount of eloquence will justify a meaningless, stunted, coarse element in design. The opening apology is sufficient condemnation. There are words finer sounding which, nevertheless, should awaken suspicion and suspend judgment—"Decorative"; regard it carefully in order to make sure that it answers the definition of the dictionary, "Fitted to adorn." In course of time it has acquired an application remote from its true meaning.

In the survey of the means at our disposal, by which we can add to our store of knowledge, and develop our powers to the limit of capacity, conversation is apt to be regarded as too trivial a method for consideration. Books have usurped the place formerly held by discourse between the instructor and his pupils; though the dialogue form survived in print until quite recently as a relic of other days. When, therefore, occasion is offered to talk without offence upon matters pertaining to the profession, they should be seized and enjoyed. Even if we gain nothing more by its exercise than a habit of arranging our thoughts and expressing them with clarity and conviction, we have not misapplied our time. All of us can learn from each other. *Viva voce* occupies an important place in examination.

Of course, there are innumerable aspects of an architect's calling capable of discussion. Discuss them. Do not be content to accept on trust. Endeavour to formulate for yourself a reason, an explanation, or a condemnation. If your solution coincides with someone else's that is no matter for disquietude. If in disagreement, it is no matter for temper. In converse we can rub off rough corners and become persuasive.

All this alludes to conversation among brothers — intimate conversation. Among strangers it is different. A witty Frenchman wrote the words, "Never show your wounds except to a physician." They are equally true of beauty spots. It is important not to let your calling down before laymen, nor to laud it unduly on the tram top. Let works speak. Help him to hear. Do not deride his views, correct them.

Rest Houses, Halstead, Essex.

Mr. E. W. Coldwell, Lic.R.I.B.A., Architect.

HALSTEAD REST HOUSES.

This building consists of five blocks, each containing four dwellings (twenty in all), each with living room, bedroom, scullery, larder, &c. In the centre of the central block is a room to be used for trustees' meetings and for purposes of recreation. The amount of the contract, without foundations and excavation, is £13,057. The contractor is Mr. Charles Deaves, of Bures, Suffolk. The foundations and ground work were carried out by Mr. S. G. Woodman, of Halstead. The bricks and tiles are being supplied by Messrs. Ames & Finnis, who will also carry out the tiling. The iron sashes are being supplied by Messrs. Wainwright & Waring, Ltd., who will also carry out the lead light glazing.

The site was before occupied by the Halstead Workhouse with Union offices and board room and infirmary. New Union offices and board room are now being erected in the town under the same architect.

The whole scheme is due to the generosity of Mr. Samuel Augustine Courtauld, who is not only bearing the whole cost of the purchase of the site and the erection of the dwellings, but is also providing an endowment.

The architect is Mr. E. W. Coldwell, Lic. R.I.B.A. Our illustration is from the exhibit at this year's Royal Academy Exhibition.

CORRESPONDENCE.

[While we are glad to publish letters on professional and other matters of interest to our readers, it must be understood that we do not necessarily endorse the remarks of correspondents, who will oblige us if they will express their views as briefly as possible.]

London Traffic Improvement.

SIR,—Were the propositions explained in your recent issues put into effect, it might be said that a start had been made centrally on the main project as above.

The northern portion of the suggested mid-Metropolitan artery has been already explained. The course of its complement may now be indicated.

The bi-level feature would be continued in a south-eastern direction across Victoria-street to the circus at Horseferry-road, thence *under* the river. On the south bank its further course would be a matter for consideration.

As regards the subway innovation at the river some explanation is necessary. It has been referred to in the *Builder* more than once already. the last time a year ago, when the arrangement was urged as a substitute for a bridge at Richmond, where a beauty spot is in danger of being spoiled by a proposed bridge. The same applies to the splendid reach between Westminster and Vauxhall bridges and, additionally, the purposes of aviation have been referred to incidentally. At Richmond the circumstances of the site, however, are very favourable, inasmuch as in the "half-tide" lock an essential requirement is already in position. By that provision the ebbing tide is held up so that any proposed structure underneath could be placed at the *shallowest level*, and so with the easiest gradient in the approaches.

Similarly with the suggestion at Lambeth. Possibly, as already proposed, London Bridge might be fitted with the arrangement for the reaches westward, and in a complete scheme the navigable channel trained to a convenient width. That would admit of a curtailment of the length of subway, and also of the application of a novel feature as regards the relative foreshores. Those might then be arranged as tidal beaches for recreation purposes. As such they would be of considerable extent, so much so that "London Unique" might take its place as one of the marine resorts of the Kingdom.

"O. B. I. T."

Leaking Lead Roof.

SIR,—The old lead on the nearly flat roof of the north and south aisles of our church is in a very defective condition. The cost of replacing being prohibitive, can anyone suggest a suitable covering which will adhere to the lead and stop leaks ?

"CHURCHWARDEN."

[Another letter is given on p. 362.]

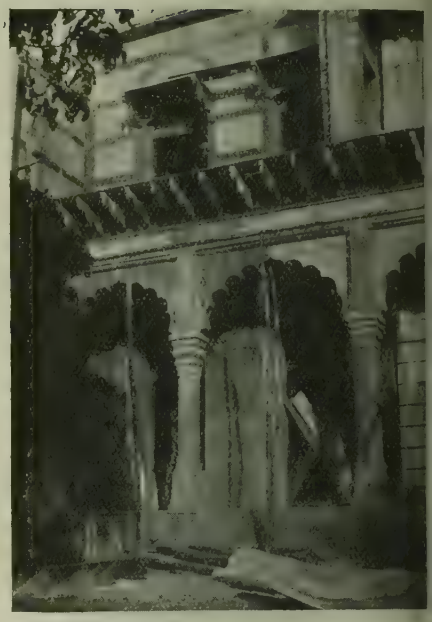
TOWNS AND TOWN-PLANNING, ANCIENT AND MODERN.*



"THE new word 'town-planning' was probably coined by some Victorian 'progressive' in the innocent belief that it represented a new art or science, concerned with problems unknown to our forefathers. The apostle of progress has usually more hope of the future than knowledge of the past." With this introduction Messrs. Hughes & Lamborn lay before us a comprehensive and interesting outline of the history of town-planning all through the ages.

More than half the volume deals with ancient town-planning and, having digested both the subject matter and the many maps and illustrations given, the reader can no longer be under the delusion that town-planning represents a new art. Excavations in Egypt, Greece and Rome show that the ancients not only designed beautiful buildings, but did scientifically plan the grouping to economise material and space, to provide convenient access to each group and each building in it, and to allow air and light to pass with least obstruction. From Egyptian times to Greek, where the rise of town-planning is reflected in the growth of building regulations and by-laws designed to secure order in the streets and to safeguard the health of the inhabitants, and from Greek times to Roman times, where the grouping of public buildings and general lay-out of the towns speak of the regularity of Roman law, we are taken in rapid survey.

Whilst in matter æsthetic the Roman civic consciousness was more highly developed than our own, there are pictures in Juvenal which might well have served as a warning to our nineteenth century statesmen of dangers and miseries attendant on the ill-regulated growth of wealth and population, and although the problem of planning for a rapidly increasing population is mainly modern, it presented itself in Rome and found Romans little better prepared than ourselves to meet it with provision of adequate measures. The rich had parks and gardens within and around the cities, which checked their natural expansion in a way which has its parallels in modern England. The State trusted to contractors to meet the problems of housing, and allowed them to disregard the old building laws and to run up jerry-built houses of timber to enormous heights in narrow streets.

The architecture of the Renaissance is well treated and some excellent examples of Italian and German lay-outs are given. English eighteenth-century work is unfavourably compared wi h foreign examples of the same date, and when considering nineteenth-century enterprises the authors are led to quote Cowper's "God made the country and man made the town,"

*Towns and Town-Planning, Ancient and Modern. By T. H. Hughes & E. A. G. Lamborn. (London: Clarendon Press). 15s. net.

Jain Arches and Dripstone, Aiwané Rafaat.

and themselves to add "and the devil ran up the suburbs." English town life and development are interestingly given, and altogether the book is an excellent guide for those who wish to follow the progress of town-planning throughout the centuries down to the present day. Chapters dealing with the modern movement on the Continent, and particularly with France's contribution, together with American views and efforts, form an interesting addition to the literature on the subject.

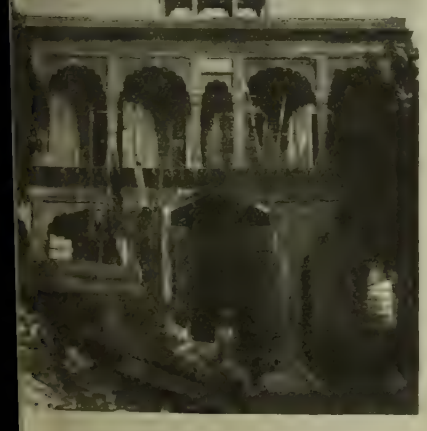
In their final chapter the authors bring forward the chastening thought that our modern cities suggest nothing greater than the intense activity of the builder and contractor; 75 per cent. of our people are now town dwellers, and London itself in a century has increased its population fivefold. The work for town-planners in the future may be to reverse the process and by means of cheaper transit, or by bringing the power to the raw material instead of carrying the material to the source of power, earn for themselves the new name of "country-planner."

The Housing Act of 1919 is considered and compared with legislation in the United States and in Australia, and the determining factors of town-planning concisely stated. Whilst contributing little that is new to the subject, the authors are to be congratulated on their thoughtful and well-got-up volume, which will do much to awaken interest in a subject which until recently has been an unexplored field to the general public; and may well serve as a stepping-off ground for many a lay mind. One reader may be led to a fuller study of ancient towns and life and customs pertaining there, whilst another may be led to investigate the history of our own towns and villages; but, with the authors, we hope it will in all cases help to stimulate interest in the towns and villages "that are still to be."

Reserving our severest criticism for the post script, we would wish that the authors had not so freely indulged their taste for poetry in this an essentially practical, book.

New Pier at Hove.

The long-deferred scheme of erecting a pier for Hove at a cost of £180,000 is to be started at an early date. The site of the pier will be immediately opposite St. Aubyns. The length will be nearly a quarter of a mile and the width from forty-five to fifty feet. The whole construction will be of reinforced concrete. A theatre will be built at the land end to accommodate 1,400 persons. Other attractions include a bandstand, casino, dance hall, restaurant, residential club, and medical baths.



THE REVIVAL OF INDIAN ARCHITECTURE

By V. B. METTA.

The house named "Aiwané Rafaat," the Mansion of High Excellence, which Her Highness Nazli Begum Rafiya Sultana has recently built in Bombay, is of great interest from many points of view. Bombay is essentially a European city, since it owes its life and growth to the English, and did not even exist in the days of the Hindu and Mohammedan kings of the country. It therefore does not reflect or interpret the soul of the East to any great extent. Many of its business offices are built in the French or the Italian Renaissance styles, with little Saracenic domes or Gothic spires super-added as mere ornamental details. Absurd and artistically faulty as all such buildings are, they are tolerable as compared with the Gothic railway station and the High Court building of that city. "Were there railway stations in the days when the Gothic architecture flourished?" "Can you associate justice with the European feudal times?" are the questions we cannot help asking ourselves on seeing them. The rich Indians of Bombay, denationalised by the system of education which is established there at present, have imitated the Britishers, and built all sorts of buildings which are an incongruous *mélange* of the Gothic, the Renaissance, the French eighteenth-century, and other European styles. What Bombay, therefore, needed was a really and truly Indian building like this one to make her orientally self-conscious.

"The Mansion of High Excellence" is designed by Mr. Fyzee Rahamin, a well-known Indian painter. But feminine influence is quite visible in his design, as it has always been in all beautiful artistic creations of the East from time immemorial. Her Highness the Begum and her sister, Mrs. Atiya Begum (the designer's wife), have, in fact, suggested a good many ideas to him about the construction and decoration, as well as the choice of the building materials of the house.

The Orientals are fond of symbols because they are intellectually imaginative, and among symbols the flowers are their most favourite ones. The lotus has been the symbol of India for thousands of years. It has been sung of and sculptured again and again in the ancient literature and art of the country. Therefore you see the whole or parts of that wondrous flower on the capitals and bases of the pillars of this house also. The rooms are large and lofty, provided with daintily carved lattice windows, through whose many-shaped perforations the light streams into them. They are to be fitted up with Indian furniture—*gadis*, *takiyas*, carpets, *tepoys*, and divans—for the Western style of furniture suits neither the Indian climate nor the Indian types of houses, nor the habits of the people. They will, however, be lighted at night, for certain reasons, by electricity, and not by lovingly carved Indian metal lamps fed with fragrant oils. But at the same time it should be noted that the electric light will be handled with Oriental artistry. It will be sent up through the floors of the rooms by means of an X-ray apparatus, to be reflected on the highly polished white ceilings, whence it will be diffused all over them. There will also be electric table-fans used there, and these will be placed in little niches in the walls behind perforated stone screens, so that their ultra-modern, non-Indian forms may not obtrude themselves upon anybody.

Aiwané Rafaat: Front View.

The ladies' private room in this house, called "Khas-ul Khas" (the Private of Privates), has a finely carved red sandstone balcony looking out upon the sea. Elaborately worked walnut wood cupboards will house the books in the "Library," which, in the poetic language of the East, is to be called "Al Makhazan" (the Treasury). The ceiling in the dining-room will be of delicately and fantastically carved wood. And on the frieze of the front hall on the first floor of the house you see, inlaid with precious stones, the ninety-nine names of God in Arabic characters. One of the rooms, which is to be called "Astana-i-Khayal" (the Threshold of Imagination), is to be fitted up as a studio for Mr. Fyzee Rahamin. The light comes into it not only from its doors and windows, but also from a small dome in its ceiling, whose base is fitted up with glass. On its walls are shortly to be painted the representations of the chief religions of the world, in order to show the fundamental harmony rather than discord between them. There is a fine kiosk built on a small platform on the terrace roof of the house, where the family will go when the heat of the day has begun to subside; it will be used for offering prayers as well as for enjoying the view of the city and the breezes that come singing up there from the sea below. There are about three kinds of arches used in this house. The first one is the true pointed arch, which the Mohammedans in other parts of the world consider for religious reasons to be absolutely essential in all their buildings. Then there is the polyfoil arch, which the Moors were so fond of using in Spain. And finally there is the Jain arch, which is of wholly indigenous origin, and is more of decorative than of constructive value in a building. In other places here the arch has given place to the trabeate structure of the Hindus, who, though they constructed many types of true arches, did not really like them, because they saw their essential weakness and impermanence. The drip-stone also to be seen in the front part of this building is absolutely of Hindu origin, but which the Mohammedans of India adopted in their architecture.

Doorway, Aiwané Rafaat.

Kiosk on Terrace Roof, Aiwané Rafaat.

I have mentioned the fact that the Orientals are fond of symbols and that this house is full of them. The finest symbolism, however, is to be found not in the house but in the garden, which is planted in front and at the back of the house. Gardening, it might be mentioned here, has been a highly elaborate art in India for thousands of years. From the spacious days when the Vedas were written until after the death of Buddha—that is, for more than a thousand years—gardens went on developing new beauties and modes of revealing great truths. This ancient Indian art then spread in many other Oriental countries like Persia, Turkestan, and China, and from them, by a strange irony of fate, the Great Moghuls, the descendants of Tamerlane, carried it back in a modified form to India, the country of its origin. The garden of "Aiwané Rafaat" is a true Indian garden, unlike all other gardens in Bombay, whether public or private. It is laid out in the form of the Cosmic Cross. The house is situated where the lines of the cross meet, and so is its Mount Meru, the abode of the gods, which should be represented in the centre of every Indian garden. In the front part of the garden will be placed a standing statue of Buddha, from under whose feet the River of Life will rise and flow right through the front portion of the garden, then pass under a stone bench in the front hall of the building, whence it will flow into another room behind, from which it will pass out into the back portion of the garden, which is to be laid out in three terraces, one rising above another—emblematic of the Three Worlds. Flowers of three particular colours will be grown in the garden to represent the Hindu Trimurti (Trinity). These three colours are red, blue, and white. The red ones will represent Brahma the Creator, the blue ones Vishnu the Preserver, and the white ones Shiva the Destroyer. Then, again, will be seen the Orientals' amorousness exhibited in this garden, because the lotus, representing Leila, will be placed in the vicinity of the weeping willow, which will symbolise Majnun, her hapless lover. There will also be cypresses, the symbols of eternity, round which will be entwined fruit trees, the emblems of this life.

The British Empire Exhibition.

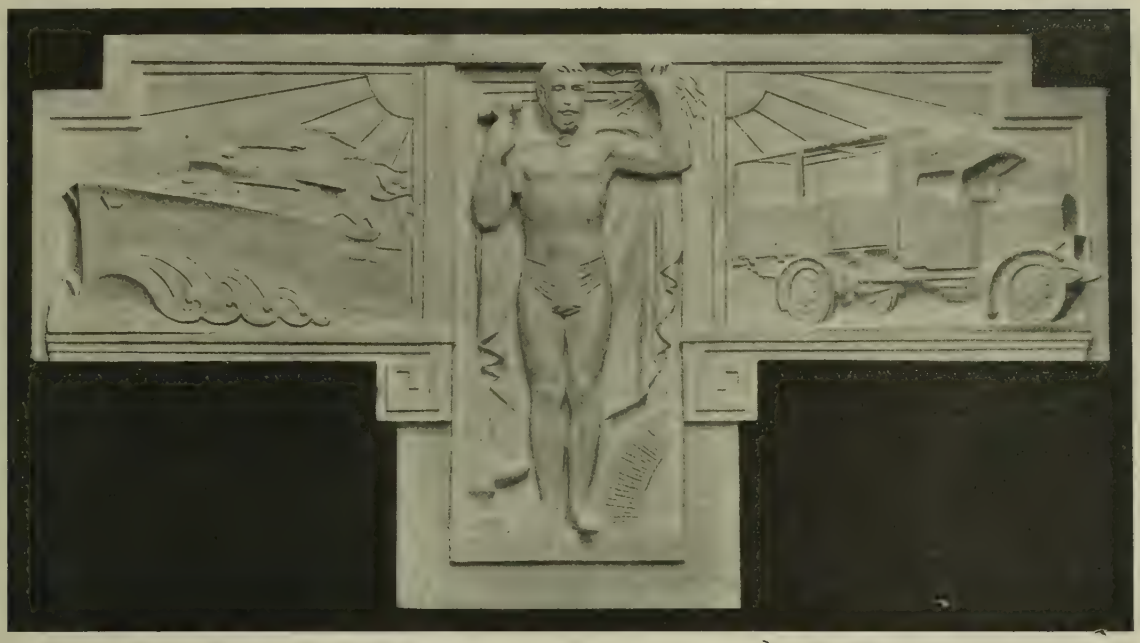
The Acting High Commissioner for Newfoundland has received definite instructions to proceed with plans for the erection of a Newfoundland Pavilion in the British Empire Exhibition next year. The cost of the pavilion is not to exceed £12,000. This decision ensures that every part of the British Empire of any size will now be represented at Wembley.—The High Commissioner for South Africa has accepted the tender of Messrs. Sir Robert McAlpine & Sons for the building of the South African Pavilion, and work is to be begun at once. The pavilion is to be completed before the end of September.—The Kenya Government has increased the sum allotted for the building of its pavilion from £10,000 to £12,000.

THE SPIRIT OF ARCHITECTURE.

By ROBERT CROMIE, F.R.I.B.A.

When man builds he puts something of himself into permanence, and that is the "Spirit of Architecture." Unlike literature, especially unlike painting, architecture does not vary with current fashion. It cannot be swayed by passing influence, or by conscious dictation, or even by imitation, until such influences have settled down into definite expression. It is slow to move, for its root is embedded in fact and the natural consequences of a series of facts—which become tradition. Only its externals are subject to the minor influences; the essentials remain persistent as the characteristics of race. They are as definite as the peculiarities of a people. It was not fancy or arbitrary rule that gave the West a steep roof and the East a flat one; each has its natural origin. And the transplantation of styles from one locality to another is as unnecessary and as theatrical as the adoption of the kimono would be in Whitechapel. In the same sense there is as little reason in erecting to-day the sort of building which was contemporary with Herod as there would be in applying his ethics to modern society. Every architecture has its day and its limitations, and therein lies not merely its historical value (which is purely academic), but its beauty—the real beauty that is truth. For, willy-nilly, truth is the essential quality of human life; it can be obscured, but not obliterated. And architecture is its record incorruptible. No mean man can create a monument, but any mean man can build a big building. When we scrutinise the known past we realise that the architecture of the world is no more than an index of mankind—the true illustration of his acts and thoughts, from which there is no escape. "By your monuments shall you be known" might have been the text of Creation. What, we may wonder, will be the verdict of posterity when our own modern cosmos comes to be examined? If we fail to-day it is not for want of guidance, but rather due to a plethora of guides and penny-in-the-slot instruction. With every man his own critic the essential quality of thoughtful reasonableness that makes monuments of buildings is murdered by conflicting ideals. In the heterodoxy of modern styles the spirit is sick, surfeited with cheap individuality and confused ideas. And the jugglery of doing anything with any material anywhere is futile and insincere.

The student's first shock comes when he tries the rules of one style against another. The theories of proportion cannot stand the test. The antique axiom fails. You cannot talk modules to Notre Dame, nor design on a system of "static symmetry." No fabric of mechanical measurement can, or ever did, produce architecture.



It was the pre-historic instinct to commemorate that created the monument—the purest form of architecture, a pious erection of stones intended to endure. The perpetuation of a memory, the raising of tabernacles, cromlechs, mastabas (probably the earliest architecture that can rightly be termed monumental), was the outcome of a belief in hereafter, or at least a psychological rebellion against the destruction of nature by nature—a vain desire to evoke eternity. The sacerdotal Egyptian, secret, believer in the unchangeable, discovered in the pyramid the "angle of repose" necessary to safeguard his treasures, which to-day are revealed with such a fervour of curiosity. In the course of mechanical development the science of construction created the art of architecture—the open book of humanity, whose phrases were of stone and metal, its chapters dynasties, its periods wars. It is the unbiassed historian.

Literature and research have illuminated the fog of antiquity; Rosetta stones have resolved the enigmas of hieroglyphics; archaic codes have rendered up their unwilling secrets; but do we not owe our knowledge less to papyrus and parchment than to pictorial decoration, the habit of carving and modelling and mere building? The commonplace implement hidden in the earth bears us testimony, and the monument carved out of rock utters the sentiment with which it was originally imbued for ages. The striving after practical perfection and the early steps in the paths of critical reasoning—a sense of proportion, for instance—are illustrated in the tombs and temples of the Nile Valley, the birthplace of the reed and the lotus and the Grecian column. The whole argument of prototype forms is a mentor which indicates in co-related stages the gradual, inevitable

Mr. Clyde Young, F.R.I.B.A., Architect.

[This rood screen is to be erected in the College Chapel in memory of the students of the Imperial Service College, Windsor, who fell in the war. The screen is in English oak, with the names carved on the lower panels. Messrs. J. Thompson & Sons, of Peterborough, are the contractors.]

Modelling at Thorneycroft House, Westminster. Mr. A. Alban H. Scott, Architect.

unfolding of thought. The spirit of the times is captured. Every architectural attempt is an epitome of its period. Every succeeding record embraces the vital qualities of its precursors—models and adapts, accepts, rejects, a process of selection—carves up the cyclopean monolith, builds up with handier stones; invents systems of measurement and values—searches Nature for embellishment; invests architecture with potter's detail and pottery with architectural ornament; introduces ivory and gold, metals and precious stones, richness added to refinement, colour and light, shade and reflection and dramatic effect, and, crowning all, brilliant and astonishing statuary. Out of earth the temple articulate is made.

The oracular Periclean period consumes the past and threatens the future; it is the date, the millennium, of mental power, of philosophy, literature, oratory, and the base-comparative of intellectual effort.

Then Rome. The Emperor adds to the world museum and detracts from it—destroys æsthetic principle, rushes in with the arch, the vault, the dome, characteristic of power, elastic and unstable, a gorgeous panorama of monumental buildings—gorgeous, yes, beautiful, not in symbolism, but with a pagan, riotous, disturbing beauty.

The Greek had the Homeric legend; visualised his deity in battle; adored the apotheosis. In death the public hero became a public god, and inspired the sculptor with at least an official cult.

The popular beliefs shook with the Romans, who created an architecture that was politically inspired, only to become stabilised by the monotheism of the early Christians. And so the story goes on—from the Cyclops to the heyday of Roman pomp, the catacombs and the Sign of the Fish . . . the portrait of St. Peter, in camera. Stealthily the curtain is rung up on Christianity. Scanning the ages we think the old world is rather suddenly dead.

When the throne of power was transferred to Byzantium the intellectual art which we call Classic was left to trail behind. A new obscurity veils the progress of thought; there is a set-back which echoes through the architecture of succeeding centuries; the humanism of the new religion was to work out its own salvation through devious routes — partly oriental and fatalist, wholly ignorant, dreading A.D. 1000. What had gone before was forgotten, lost in the interregnum, whose monument was the basilica—fashioned out of second-hand material, but impregnated with faith. It was a make-up—built of Roman relics and improved by expatriated Greeks. It possessed a beauty that is non-axiomic. Failing for want of arbiter, it arrives timorous, persists, and ritualism breathes it into throbbing reality. There is no architecture so intensely spiritual.

It was a policy of divergence that caused the Church to refute the temple influence—naturally in concern for its own integrity. The basilica weaned away as speedily as possible from the heathen element in its construction and decoration, and sculpture received a deadly blow when Constantine legalised the new religion, proscribing the worship of the graven image; the Heroic Age passed the way of the Golden Calf.

A sort of democracy laid the foundations of the cathedral era. If there was little tradition to replace legend there was altruism and allegory. Christ, Madonna, the Apostles, were reduced to symbols. The Crucifix, mechanically repeated; the Lady, naif, often grotesque, and the curious pictorial hierarchy of the Romanesque ecclesiastics exhaust the total of Biblical influence on sculpture. So it degenerated into carving—and carving became a craft. The mediæval philosophy retarded the plastic art, forbade the nude, centralised study, reduced teaching to formulæ from the lap of Papal authority, and condemned science—only to give birth to sorcery and a clericalism once removed from priestcraft. Yet it inculcated a fanatical zeal that covered Western Europe with real monuments —a complete, abiding gamut to the glory of God and the wisdom of restraint.

Then came the pageant Renaissance, cutting across the traditional track with its individualism, patronage, and brilliant versatility. A profound intellectual activity prevailed. The influence of genius is the characteristic of the revival. A thirst for knowledge, and scientific research, subversive, anti-mediæval, and regenerating, it had neither hesitation nor morality. Virile and resourceful, its leaders overcame the established, if frail, opinion. It was a case of new wine in old bottles. They approached nature. They converted religion into art, and antiquity into a source of information—whence a synthetic architecture, aristocratic, lacking in bourgeois sincerity, fearful of the commonplace. They created the palace—and made portraits of the prophets. Thought, learning, wealth, were dissipated in an enormous constellation of buildings; the prince was prodigal of other people's money. The Popes availed themselves of the occasions to turn to the Church's and their own advantage the works of literati, artists, and engineers. Their bastard buildings were half Roman, half modern, wholly conscious of a striving after originality, new forms of construction and treatments of material, the introduction of painters' composition, perspective, vistas, and every conceivable effect. It was an age of taste, and its works were the achievements of competing schools; masters and patrons dictated and were constantly at loggerheads; pupils outshone their professors; mechanics and filigree workers became poets, painters and sculptors; copyists and artists became architects and engineers, and dilettanti flourished. It was not possible that a definite shape nor even the true essentials of a pure homogeneous style should spring from such a fount of mixed waters.

If the Italian style was founded on the work of academicians it is not without brilliant examples that outshone their rivals and affected the rest of Europe. The genius of the Renaissance initiated genres which others copied, although failing to re-incarnate the real spirit.

The return of modern architecture to a sense of purity and constructional frankness is symptomatic of a much better appreciation of those lasting qualities that are the grain and the essence of monumental work. The mark of the Renaissance will fade, as the mark of the Gothic has faded. Has there been any architectural gain, any improvement? Nothing in comparison with the length of time through which the Ideal has persistently struggled. Leaping two thousand years the Neo-Grec has flickered sufficiently brightly to light the way to a better understanding. It has clarified confusion and shown the value of disciplined learning. It has cleared the ground for an architecture whose style shall be stimulated by the difficulties of modern needs, rid of pedantry, inspired by sanity and economy.

But is it enough that the way be clear?

The spirit of architecture has sped from Babylon to New York, from the tabernacle to the tall chimney of commerce. The cauldron of Industrialism still seethes with unnatural energy unspent, but the momentum of philosophy is broken. Once more the golden calf struts its pedestal. Wealth! The Imperialism that built Europe has smashed Europe, and the world is embittered. The church spiritual, the palace temporal, shall make way for "commodious offices."

The dumb gods shall be shattered—because they are dumb.

THE SOCIETY FOR THE PROTECTION OF ANCIENT BUILDINGS.

Mr. A. R. Powys, Secretary of the Society for the Protection of Ancient Buildings, writes:—

The letter which appeared in your issue for August 17 on this subject makes me want to write in reference to the art of newspaper letter writing, and to state shortly, under headings, the various reasons which cause men to desire the preservation or restoration of ancient buildings. It is a convenience to group under headings reasons of the latter kind; but in doing this we draw firm lines around the different aspects of the case which do not in reality exist.

First, then, as to newspaper correspondence. I have to do more of this than is good for me, and from my experience it appears that a *correspondence* as such is begun unintentionally. Someone wishes to draw public attention to some point of view he feels is being neglected or overlooked, and he writes a letter frankly and without an eye on his defences. His words cover (sometimes too successfully) the thought he wishes to express. Some other person, reading the letter, feels that he is being personally attacked, and answers not the purpose of the letter but the words. Then, if he is clever, he will score many points. The original writer is drawn in to play the game of controversy. The amused audience, careless of any deep-seated intention in the original letter, balance the points won by each party.

The letter in *The Builder* is clever in this respect. "Isis" puts into quotation marks phrases which, with one exception, are not to be found in my original letter in another paper. To a different audience, his victory appears complete; but since he is not quoting accurately, the reader will perceive that it is a victory over an adversary specially set up to be knocked down. That would, perhaps, be the way to reply did I join the game of newspaper controversy; and, according to the rules, some points would then be mine.

But except for the fun of the game this method of dealing with serious problems is unprofitable. This answer avoids the intention of "Isis's" letter, and were it an answer to a letter of mine I should consider it a quibble. So it seems better to turn to realities, and if I can do so, to express in words some idea of why this problem of dealing with ancient buildings should be considered.

I desire here to enumerate the different attitudes of mind with which men approach the subject, putting them into separate compartments. I am aware that in real life this is not possible, for in life we feel with our whole personalities; and it may well be that the wiser we are the less do we confuse our feelings by putting them into words, unless we can be fairly certain that some other quality of ours (a quality which may be akin to telepathy) will help to clear our meaning in the mind of a companion.

As to the attitudes of mind, let them be as follows: the historical, the architectural, the artistic, the structural, the economic, and let us say nothing of the others.

The historical argument, whether it refers to forgeries or to preserving original work, when followed separately to its logical conclusion becomes absurd. In a general sort of way both are sound. . . . We can say with regard to ancient buildings: "What we do in the next millionth part of time is as good history as that of any other time. Let us do more and more, and leave the past to take care of itself." In part this is true; in part it is also false. But what of architecture? Architecture is an idea in the concrete. It is frozen music. Where a part of the harmony has melted away it must be recreated and put in a refrigerator to freeze again. At all costs we must have the whole thing. We must do to the fragment of building what Chapman did for Marlowe's *Hero and Leander*. That poem has now the right number of lines, is divided into balanced sestiads, and the story is complete. How excellent! Let us, therefore, complete Kubla Khan. Your analytical literary man will come close to telling you where Chapman failed. He will be most convincing; indeed, had he time and were he paid, he might be willing to do the end of the poem right himself. Yet we know he would not succeed. Can we logically say why? We can only say vaguely—sentimentally, if you prefer that word—that the soul of the poem was the soul of Marlowe answering the spirit of his age; and that no other man can artificially create that from his own personality. Does someone say that architecture is different; that I am side-tracking and am using analogy to "make a point"? Maybe they are different, and maybe I am making points: who can tell? Yet you will recognise that there is truth somewhere at the bottom of what I am saying. The argument of the architectural attitude leads to the admiration and appreciation of the perfect architectural unit only. St. Mary's Cathedral at Salisbury is nearly this; St. Paul's, also, is as complete a great building as any. Men are moved by architecture of this sort. But is not Canterbury Cathedral fine also? Does not Wells cause more than intellectual pleasure? These are not architectural units, they have come about. That which moves us in them all is the human desire that has been put into them by some builder Marlowe, some carver Coleridge, or some group of poets as Homer. Is architecture a thing of form and material only? Can it be produced by scholarship? The world would be superficially more pleasant were this so.

Further, does not time add an increased beauty to buildings? This word beauty leads me to the artist, the painter, the poet, and the modest man who loves the picturesque and whose emotions quickly receive impressions, so that we who are of harder stuff, with more constructive brains, call him sentimental. Should we not, then, in considering the treatment to be meted out to an ancient building, respect the desire of these folk? Is there not some beauty belonging to it—maybe it is the beauty of mystery, of colour, or the beauty of form modified by the action of time—which your architect or structurally-minded man would destroy in his desire for completeness or stability? Before you say yes, or even a qualified yes, consider the weakness of these poor folk. They care not for history, neither do they care for the future. Why should these matter to them? The future will grow a beauty of its own; and the past, has it not fulfilled its function by giving us such lovely things? The sentimental fellow would cry: "Do not add stone to stone nor remove any of those yellowing leaves. Wait! Perhaps that wall should go, so that the light on the river may be seen from just here; and that tree, it confuses the graceful line of the nearer birch. To give just the right composition these things must be removed. And that iron crane must for ever hang just there to be a foil to the delicacy of the foliage, as is the bright armour to the lace collar of a Stuart youth." Is not this painter of three-dimension pictures right, too? In something he is; but the poor fellow is unpopular to-day. He must be a low, bad person with a loose, unconstructive mind. Besides, he understands nothing of the importance of archæology. We must teach him better, harden his mind if not his heart. Let us send him to the engineer to learn to take pleasure in the wonders of building with geometric precision. Is not he a master, this engineer? Is he not right, too, in his appreciation of the old work put together with such nearly perfect skill in an age when there were no sliding scales and no long-armed steel cranes? Should not such works, sprung from the instinct of man, be rendered permanent, stiffened as only an engineer can stiffen them? Is it not wonderful how he can catch in mid-air the falling mass of masonry, catch and fix it firmly in its place like an icicle that will never melt? Change and decay are so remote from his work that they may be forgotten for generations. Change ending in death is no longer found in his work; and the sting of unchanging life—life that is ever stationary—takes the place of the sting of death.

From some remote distances the man in the street hears the windy words of the experts exchanged in high dispute. He hears, and remembers some catch phrases, and confusedly attempts to reconcile them. In his daily life he has learnt that the getting of meat is the chief necessity of his physical body, and he concludes, in consequence, that the cost of whatever works are done should be related to economic necessities. He is aware of beauty, would like to know more of history, not quite realising that he himself is a link in that chain. The secrets of construction appeal to his imagination. Yet all these things must be subordinate to his daily occupation.

In these words of mine, where is there any reference to the principles of the Society for the Protection of Ancient Buildings, with its dislike of forgeries and its belief in the living customs of the building trades? I think if anyone troubles to read the manifesto which William Morris wrote to be an expression of the aims of this society, he will find that the principles stated there do not give greater value to anyone of the "attitudes of mind" than another. They are based on common sense. There is no talk of completing buildings in the name of architecture. There is no word expressing joy in decay. There is no overrating of historic values. Romance and change are recognised. The importance of maintenance is emphasised, but there is no boasting of the possible feats of the engineer. A feeling for the beauty of old buildings as we find them, and a desire to keep them in fair structural repair as they have come down to us, is the keynote of this document. The passage of time, past and future, with its softening influence is accepted. Although extreme measures are not in themselves decried, they are clearly not recommended. There is evidence of a desire to use the knowledge of experts, while it is still within some circle where each exponent has not yet separated from his fellows by following his own line of reasoning to its logical conclusion. All through this treatise may be found indication of the value of ancient buildings in relation to the things of daily life. A proper sense of economy, though never a suggestion of meanness, is there also. Common sense is the basis of the appeal.

Let us, therefore, without neglecting to use any of our faculties, keep what we have left of these fine works, not adding to them for any but practical reasons, nor yet pulling them down to save money. Let us preserve the structure but not disfigure its appearance—and maybe weaken it—by inserting patches of plain or carved stone. In a word, let us among other things, avoid tinkering with wall surfaces, yet do what is necessary for structural stability, not working extravagantly to show our power and knowledge, but gently and modestly, from day to day and year to year, so that these buildings may remain still carrying within their walls the soul of the builders, as does Marlowe's great poem the full being of its author.

Armstrong College Library Competition.

As a result of the recent decision of the Council of Armstrong College to build a College Library, all practising members of the Northern Architectural Association, and a few architects in other parts of the country, were invited to submit competitive designs for the building.

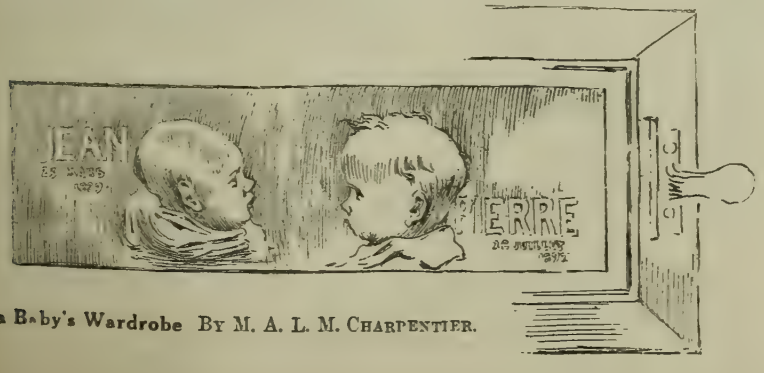
Thirty-two designs were received from 26 competitors, and Mr. H. Martineau Fletcher, M.A., F.R.I.B.A., who was appointed assessor upon the nomination of the President of the R.I.B.A., has now issued his award. (*See p.* 356.)

All the designs submitted will be open to inspection by the public in the Gallery of the King Edward VII School of Art, Armstrong College, between 10 a.m. and 5 p.m., to-day and from 27th to 29th September.

In accordance with the terms of competition and award, Mr. A. Dunbar Smith has been appointed architect of the library, and work will proceed forthwith. The building will consist of a reading-room seating 122 readers, storage space for 175,000 volumes, and accommodation for 55 research students, administrative rooms, and photographic laboratory, and is so designed that additional storage space for 60,000 volumes may be added when required. A beginning has thus been made to a scheme whose realisation will not only fill a long and sorely-felt gap in the equipment of Armstrong College, but should prove an inspiration both to teaching and to learning within the College.

Basingstoke Housing Scheme.

During its consideration of the housing question the Basingstoke Council had been helped with sketch schemes for the various sites prepared by Mr. J. Arthur Smith, F.R.I.B.A., then a member of the Corporation, and upon Mr. Smith's retirement from the Council his firm—Messrs. Wallis & Smith—were appointed architects for the Borough housing schemes, and the design of the lay-out and houses was entrusted to them.



The site is contained in the triangular shaped land of about 20 acres extent, bounded on the eastern side by the Sherborne and on the western side by the Kingsclere roads, and on the northern by a fence dividing it from Merton Farm land. The site has a natural fall of about 40 ft. to the south-east. The lay-out has been designed to obtain as great a building frontage as possible to these existing main roads, and also both sides of a new 40 ft. road running east and west across the north of the site. The completed scheme would have provided 210 houses (12 to the acre exclusive of roads and open spaces), and the contract with the builders included the whole in three sections, with the proviso that the Council should have the option of omitting the last section of 75 houses along the new north road) if the circumstances necessitated it by a specified date. The omission of the last section was determined by instruction from the Ministry.

All the houses are of the "parlour type"—that is, they each contain parlour, living-room, scullery, larder and coals on the ground floor, and three bedrooms and bathroom and separate w.c. on the first floor. The area of rooms and accommodation are similar in all houses, but the planning has been varied with seven designs to suit the varying aspects of the different roads. The houses are built in pairs, except six blocks of four each, set back from the roads to break the line of frontage, and a block of three at the apex of the site facing down Chapel Hill. The construction and arrangements generally have been carried out to meet the requirements of the Ministry as set out in the manual in connection with the Tudor Walters' report, and all the accommodation is contained within the main walls of the house without any out-buildings.

All living rooms have a southerly aspect, and the sculleries are so planned as to overlook the gardens for the purpose of the supervision of children during domestic working hours. The drainage has been carried out on the sectional system, with a number of houses collected to one connection to the public sewer. There is only 520 ft. length of sewer in the total length of 2,010 ft. of new roads, and the 81 houses fronting the existing main roads are connected with the existing public sewer at eight points only. Each house is supplied with a gas cooker, independent copper in scullery, a cottage range in the living room (of the improved cottage type), a gas geyser in the bath room, and four points of electric light. Two of the three bedrooms have fireplaces. The houses are all brick-built, with 11 in. hollow external walls, 9 in. party walls, 4½ in. brick internal partition walls on ground floor, and 2 in. partitions on first floor. All roofs are tiled. Ground floors are all solid—boards in mastic on concrete in parlours and living rooms, and granolithic to passage and scullery, &c. The woodwork was finished with Solignum, and paint only used for ironwork.

The building contractors are Messrs. W. F. Drew, Ltd., of Chalford, Glos, whose tender was the lowest in open competition. The work in roads, paths, and sewers was carried out by Messrs. Henry Osman & Co., of Southampton. Quantities and the adjustment of accounts were entrusted to Mr. S. J. Bryant, F.S.I.

The houses were completed in March, 1922, and the total all-in cost per house was £965, exclusive of roads, sewers, and site.

From a Baby's Wardrobe By M. A. L. M. CHARPENTIER.

Bournemouth Pavilion Competition.

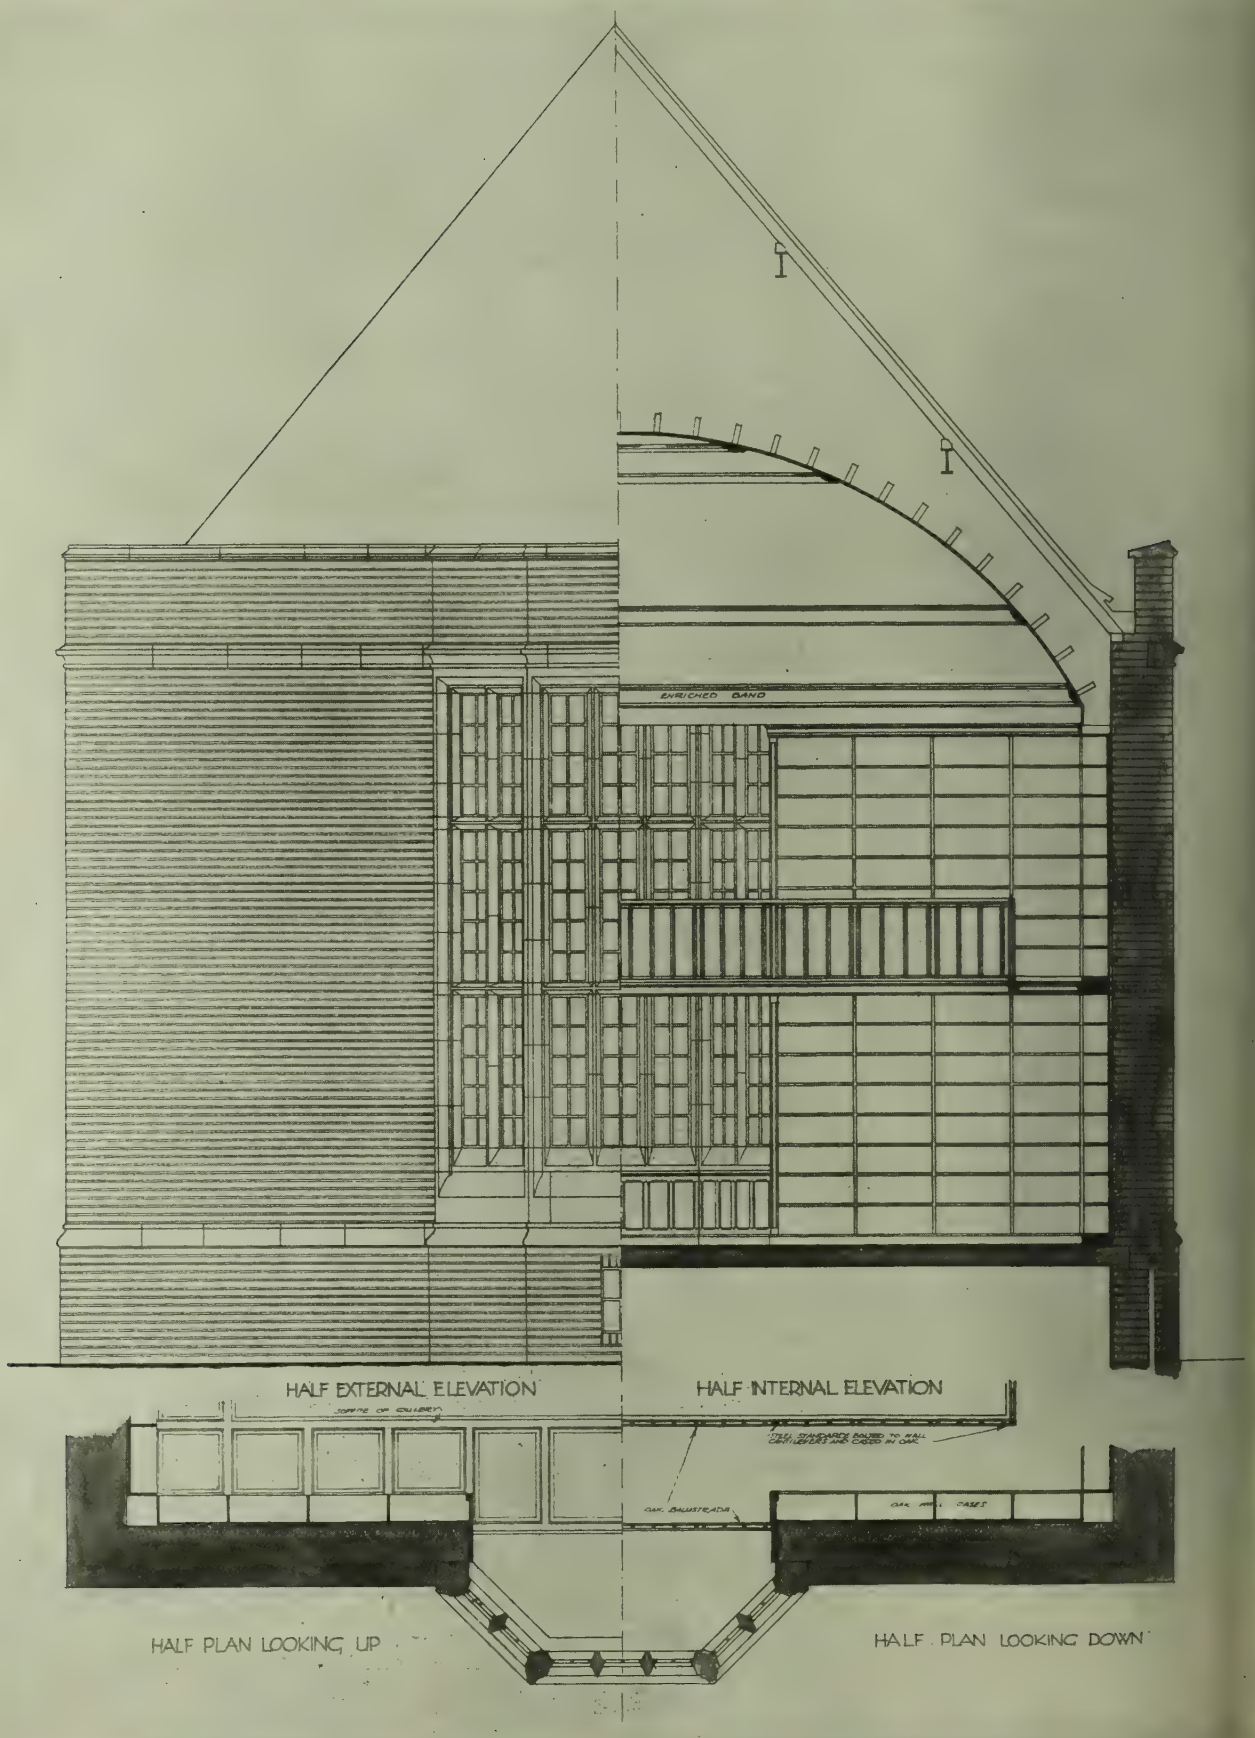
The design illustrated this week was submitted in the recent competition by Mr. A. G. R. Mackenzie, F.R.I.B.A.

The architect's report stated that the concert hall accommodates 2,000 in theatre seats—1,250 on main floor, and 750 on gallery. A sunk orchestra is provided capable of being covered over to afford additional floor space. The lower ground floor refreshment room and tea balcony accommodate 650 and 400 respectively. The main floor tea and refreshment room, with balconies, accommodate 525 at floor level, and an upper balcony has been provided enabling this number to be maintained when the centre of the floor is cleared for dancing. The lounge, with balcony, affords accommodation for 250. 4,300 super. ft. have been allocated on lower ground floor to beach undertakings. A further 1,200 super. ft. would be available if a new pump room is not required.

The materials proposed are:—Brick walls covered externally with Bath stone, except where not seen on east elevation. Steel stanchions and roof trusses to concert hall. Timber roof construction covered with Roman tiles. Ferro-concrete floor and stair construction. Pitch pine wood block flooring. Maple dancing floor. Plaster wall decoration. Deal stained joinery. Iron balustrading to stairs and balconies.

The cost of the building is estimated at £100,000, including clearing the site, incorporating water tanks and boiler in building, heating, and lighting, but excluding architect's and quantity surveyor's fees, organ furnishings, steps and terraces beyond building line, electric pump and laying-out of grounds.

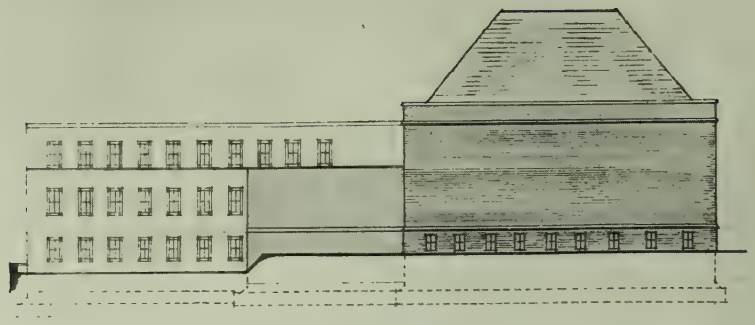
[The first premiated design, by Mr. Wyville Home, A.R.I.B.A., and Mr. Shirley Knight, F.R.I.B.A., was given in our issue for July 6.]



THE COWLEY FAMILY.

MR. EDWARD JOLLYE, A.R.I.B.A., writes:—

Only by means of heraldic devices, arms, or crests is it possible, probably, to trace the descent of certain families or members of that family. The arms most frequently in use were often inscribed on tombs, or memorial tablets, and if the bearers of a certain shield-of-arms migrated, such records would be found in different parts of the country. In the present instance, the quest is for the forbears of a certain Thomas Cowley, of Donington, near Spalding, in the County of Lincoln. He was a large benefactor to Donington and district. This Thomas Cowley was born in 1625, lived and died at Donington, where in the aisle of St. Mary and Holy Rood, the parish church, is a slate slab recording his death in 1721, at the age of 96.



In the "Red Cow" Hotel assembly room, at Donington, which belonged to Thomas Cowley, is his painted and framed representation of his arms—a silver shield charged with (a black) lion rampant, having an engrailed boarder charged with silver mullets or five-pointed stars. By search through old works I have found this coat, or shield, of arms, drawn by Stowe, the historian and eminent antiquarian, and it is assigned by him to Walter Cowley, of London. In "Foster's Collectænea Genelogica," Cowley of London is given, and a note says, "From County Stafford." In the "Genealogist," under Grants and Certificates of Arms, it gives: Cowley, Walter, of London. Arg. a lion ramp. sa; within a bord. eng. of the second, charged with eight mullets of the first. Crest—from a crest coronet or, a demi lion sa.

It is thus possible your readers either in London or Staffordshire, or its adjoining counties, can point to some memorial or tablet depicting these arms, or have records or books of reference at hand which will give information. I shall be greatly obliged to anyone who can kindly give us a little more information to help us.

THE BUILDING ART: THEORIES AND DISCUSSIONS.—IX.

By W. R. LETHABY.

THE ARCHITECT OF WESTMINSTER ABBEY.

In his fine new book on Westminster Abbey, Mr. Westlake, by fresh study of the documents preserved at the church, has shown that Master Henry, the mason, who was what we should call the architect of Henry the Third's great work, was almost certainly the same as "Master Henry de Reyns Mason," mentioned in 1256, in a deed, by which Hugh, the son of this Henry, assigned to the Abbey a rent of five shillings a year from a messuage in Westminster which had been given to him by his father.*

Now it has long been acknowledged that many characteristics in our church are derived from the Cathedral at Reims, and this fact, together with the name, makes a strong case for arguing that the architect at Westminster was a Frenchman, who had been employed on the French coronation church, and was brought here by Henry III to build the English Coronation Church. On the other hand, the general view in regard to the architectural character of the church has been that it is specifically English, but shows study of contemporary French art. Sir Gilbert Scott put it thus:—

"Judging from internal evidence, which is all we have to go upon till the documents are thoroughly searched, I should imagine that an English architect, or master of the works, was commissioned to visit the great cathedrals then in progress in France with a view of making his design on the general idea suggested by them. The result is precisely what might have been expected from such a course. Had a French architect been sent for, we should have had a plan really like some French cathedral, and it would have been carried out, as was the case with William of Sens' work at Canterbury, with French details. As it is, however, the plan, though founded on that common in France, differs greatly from any existing church, and contains no French detail whatever, excepting the work of apparently one carver. The church is remarkable as marking the introduction of the French arrangement of chapels, which, however, failed to take root here; and the completed type of bar-tracery, which was no sooner grafted on an English stock than it began to shoot forth in most vigorous and luxuriant growth."

Our being able to accept a French architect for our famous church depends on whether we can allow a predominently French character to its architecture. This is a question of style criticism, and it is as difficult of proof as it would be to prove whether an unsigned picture was by Raphael or Titian. Certain students will be quite sure for themselves without being able to demonstrate their view. It happens that my days of studentship were in the time when there was a special enthusiasm for French cathedrals, and I must have been one of the last of those who concentrated on the "professional" study of these masterpieces of structural art. I have worked, measuring and drawing, at all the great monuments of Northern Gothic art, at some of them again and again, and I may set down three dozen as they occur to me, partly for the sound of the delightful names: Amiens, Reims, Paris, Beauvais, Chartres, Bourges, Vézelay, Tours, Nevers, Autun, Auxerre, Clermont-Ferrand, Lyons, Mantes, Laon, St. Quentin, Noyon, Soissons, Senlis, Meaux, Chalons-sur-Marne, Langres, Strasbourg, Rouen, Coutances, Bayeux, Le Mans, Troyes, Sens, Angers, Poitiers, Tournay, Geneva, Lausanne, St. Omer, and Abbeville.

*Mr. Westlake also quotes a record of the purchase of houses at Westminster by the King for Master Henry, on July 6, 1245. This is exactly the date when the building was begun; in the Close Roll, this purchase is said to have been "for the work of Master Henry."

Without bias I vote for an English master, for it would be a romantic thing to have a great French church in London. All English architects, so far as I know, have taken the same view, so also have American students, and no Frenchman has wished to claim Westminster as an example of great "ogival" art. It has been carefully studied by Count Paul Biver, Mons. C. Eulart and Viollet le Duc—the last-named, significantly dated the south transept at Westminster as 1230—that is, he thought it not nearly so advanced as French work would have been *c.* 1250.

Mr. Westlake supports his theory by a reference to the late Mr. F. Bond's *Westminster Abbey*, 1909. However, it was not Bond's view that a French master conducted the actual works at Westminster. His was an intermediate position. He pointed out French characteristics, such as the radiating chapels; the proportions of the interior and the tracery of the windows; the buttress system; the north transept front with its porches. Then he considered how far English ways prevailed. But, he then argued: "Practically in all essentials it is a French church and had little influence on English architecture." However, he goes on: "If the church was designed by a Frenchman it was certainly not carried out by him." . . . "It was designed by a Frenchman, but built by an Englishman." He did not know that the Henry who was the first master probably had the name of Reyns, and he might have gone further in his claim if he had; but his recorded view was that a French master sent some drawings and "May never have come near the work." This scheme would have allowed of the large English contributions in the work which Bond himself admitted, whereas, under a resident first master who was a Frenchman, these could not be explained. Even this view, however, does not sufficiently recognise the English "feeling" which penetrates the entire work done from 1245 to 1270.

. . . . .

Mr. Westlake says: "When so much of the skeleton fabric is French and nearly all the subsequently added detail English, is it too much to suppose that he who had to do with the former was a Frenchman?" It is not possible to divide skeleton and detail in this way. Much of the skeleton is of English type and the detail is subsequent only to the plans not to the building of the skeleton. Again, it is further suggested that the English character of our church may be explained by the fact that the works were not very forward when Master Henry died about 1253. Now, there are two important fabric rolls of this year which have been printed and analysed by the late Professor Willis (G. G. Scott's *Gleanings*, p. 231), and from these and other references we can determine within fairly narrow limits the progress of the works up to this time. The eastern part of the Confessor's church was destroyed in July, 1245, and actual building from this time was pressed on by the eager King.

The Crypt of the Chapter House must have been the first part of the whole church which was entirely completed (say 1246), and this is English in every respect. The three bays of the cloister between the Transept and the Chapter House entry have the next earliest vaults, and these may be dated about 1248–50; they are of an earlier character than the vaults in the church, but like them they are typically English. The first part of the superstructure to be finished was the Chapter House, and this everybody admits is in the English tradition.

As early as 1248–9, "task work" (by special agreement) for the masonry in the Cloister (under the west aisle of the south transept recorded.

In 1252–3 the King ordered that tin should be obtained for the roof of the new w of the church and for the stalls of the monk the same. In the Fabric Roll of 1253 we references to great marble columns (doubl those of the interior); window tracery; vouss (of the arches); bosses, and chalk for the fil of the vaults; also a large quantity of iron fr Gloucestershire (for the tie bars of the ar and stanchions of windows). Still more sig cant of the completion of some parts, we lozenges (marble squares for paving) mention and glass white and coloured, which was iss for the use of several glaziers. Plumbers w also employed and limewashers and paint The entry to the Chapter House from cloister was being built and canvas for windows of the former was obtained.

On this last item, Prof. Willis remark "The mention of canvas for the windows the Chapter House shows that these wind were so far completed in 1253 as to require be closed with canvas until the glass was re for them." Two sculptured figures for Chapter House (probably a beautiful "Annun tion" group) are also mentioned at this ti and later, in 1258, it was directed that residue of the tiles used for paving the Cha House should be laid elsewhere.

As early as 1249 the King had ordered Ma John of St. Omer, then painting the Ki wardrobe, to make a great lectern for the " Chapter" (Liberate Roll). Now Matthew P mentions the incomparable Chapter House Westminster under the year 1250, and it m not be doubted that it was even then advanced. The fine tiles, which are still the floor, would have been put in hand al 1250–5. They contain the pattern of the gr Rose windows of the transepts, which m thus have been designed before the tiles. Th windows thus belong to Master Henry's wo Indeed, this is shown by the fact that t are the most French of all the parts of the chu and they certainly belong to the first Fren copying impulse. So do the fine sculptu angels in the spandrils just below them, wh were inspired by angels at the Ste. Chape It becomes clear that the first work, 1245- was settled wholly by Master Henry.

On November 7, 1254, Henry III issued mandate that money should be provided fr the Treasury or otherwise to recall the workm who have left [on strike!] for the church m be consecrated at latest on the translation St. Edward the Quinzaine of Michaelm This, of course, only applies to the east part; the intention to consecrate may ha been one of the King's extravagances, but work must have been far advanced. Inde I am now disposed to think that the porti head in the North Transept may be that Master Henry rather than his successor. 1258 the work to the west of the crossing undertaken.

There is no change of style in any part of first work (up to 1258). Already in the w arcade of the Chapter House, which can har be later than 1247, diapered spandrels—the n differentiating characteristic of the inte work of the whole church—are found, and in upper part is the most advanced trac Gilbert Scott, considering this question, st "The church itself was by this time [125 indeed as early as 1249—in a state of rapid gression, so that the architecture must, in main, have been settled at the time of its c mencement."

Twenty years ago I wrote: "Master He must be considered the architect of the buil in all its parts." Then, after pointing out debt to France, in detail, I added: "We readily make the fullest allowance for Fr influence at Westminster, for so entirely translated into the terms of English detail the result is triumphantly English. It remarkable thing, indeed, that this chu which was so much influenced by French f should, *in spirit*, be one of the most Engli buildings. This, perhaps, is only to be fe

accustomed to read what is in buildings annot easily be demonstrated." I gave details as to the character of the details in ce of Mr. Bond's book in the *Journal of the te of Architects* (1910).

was well said by an English architect—I Sir Gilbert Scott's son—"Westminster seems like a French thought in English "

. . . . . .

we will go back to what is known of Henry and consider whether he was arily a Frenchman if, as appears to have he fact, his second name was Reyns. I o make a little reservation even here, for uld be proved that Henry de Reyns the must himself have come from Reims, should have to think that he could not been the same Master Henry who began ld the church. I may remark that the Henry was very popular in England at this nt; and I cannot see, even if Reyns arily represents Reims, why the Henry of name should himself be a Frenchman. ew Paris does not seem to have been a man; William Torel, the artist, who Queen Alionor's exquisite but very English effigy, also bore a French name. If Henry had been specially brought from to build the church it would be difficult derstand why the name Reyns does not r while he was working for his patron. It rther to be pointed out that the Oxford nary gives Reynes as a form of the name s; and as Mr. Westlake says, "it must not gotten that Rayne in Essex bears a name hat similar in sound."

two successors of Master Henry at minster took their names from Gloucester everley, and is it not probable that Henry alled from Rayne, otherwise Reynes? entries in the Patent Rolls show that at me with which we are engaged, Reynes, ex, was a place well known to Henry III, sued three mandates while staying there. 40 the King ordered that a tun of wine l be sent to "Resnes" (Liberate Roll). e index to the charters at the British m I find that "Reine" was said to have granted to Westminster itself by the sor. There is a further charter of the f Henry II, where it is called Reines, and 7 it is spelt Reygne.

The London *Feet of Fines* William de s is mentioned in 1198 in reference to t Edgware; and in 1230 William de is named in connection with premises in ore. The names, or forms of the same Reymes, Raines, Roynes, are also found Patent Rolls of the time of Henry III. e Calendar of St. Paul's Documents Reynes is mentioned. In Buckingham- Clifton Reynes with a church in which eral fine tombs of members of the Reynes

e is thus ample evidence to show that a bearing the name of Reyns and working lon may not himself have come from the Reims. There are also reasons beyond me convincing) architectural evidence v that Master Henry was in fact an man.

irst known reference to him is a mandate December 10, 1243, that robes should n to William le Brun, and to Henry, of the King's masons. The King had Windsor on the day before to keep as and this is the first of several orders s which were granted once or twice o persons in the King's service. Now le Brun was a King's clerk and Keeper orks at Windsor. Sir W. St. John Hope of certain works ordered in 1243 that *stodes operacionem* at this time seem to n Hugh Giffard, William le Brun, and he Carpenter, who were *custodes* the g year." These robes of office and the aster of the King's masons," show ster Henry occupied the regular office mason. The association with William nd the place where the order was issued probable that the mason was occupied at Windsor. And of this there is further evidence.

In 1243 a mandate was issued to the Sheriff of York that the castle there should be strengthened according to the advice of *Magistrum Simonem Carpentarium et Magistrum Henricum Cementarium*, whom the King sent to confer with "other masters expert in the science" (Close Roll, wrongly indexed—p. 291 instead of 293). Such work was part of the ordinary duties of the King's master masons and carpenters, and Simon at least had practice in castle work at Windsor. We have already seen that he was engaged at this time at Windsor.† Master Henry seems to have retained the office of King's master-mason until his death about 1253.

We know that a son of Master Henry of Reyns was living in 1256, as shown by the record of his gift to the monastery. Forty years later, as appears in the accounts of the erection of the Eleanor crosses, a master mason named Nicholas Dyminge de Reyns built the cross, which still exists at Waltham and is a typical piece of English work. The name Raine is still well known. Proceeding from my conviction, the result of all I know about mediæval architecture—that Westminster Abbey Church is English work, and allowing that the architect, Master Henry, probably bore the name of Reyns, I conclude that this was the name of a place in England or of some family settled in the country before the time of Master Henry.

. . . . . .

When I studied the work of Master Henry, some twenty years ago, I suggested that he was the architect of the King's Chapel at Windsor, built about 1240. Mr. Westlake's theory does not allow of this. His view is that Henry III saw Reims Cathedral when he was in France in 1243 and that he found his architect at Reims itself. After his return Master Henry comes "suddenly into notice by receiving on Dec. 10, 1243, together with one William le Brun, a gown of office as Master of the King's Masons." The building of the Chapel at Windsor was in progress, but with it the mason "seems to have had no association." A reference to Sir W. Hope's big book on the Castle is given, but there it is only said "very few names have been preserved of the craftsmen engaged for the period under notice."

No other King's mason than Henry is known at this time, and the work is likely, by reason of his office, to be his. Further, the existing part of the chapel so singularly resembles Westminster work that no one who will compare them will be able to doubt that they are by the same master. The Chapel was part of a large "work" which included new chambers for the King and Queen. Of the Chapel Sir W. Hope says: "In 1239–40 the King issued a writ to Walter de Burgh for the making of a Chapel 70 feet long and 28 feet wide. . . . The north wall of this below the windows is actually a work of King Henry III." In 1244 another order directed that the works should "proceed winter and summer until the King's Chapel be finished." It was to have a high wooden roof like that of the new work at Lichfield, "so that it may appear to be stonework." I take this from Hudson Turner. Sir W. Hope translated the last words (*apparеat opus lapideum*) "so that the stonework appear," but the meaning was probably that it should have a wooden "vault." The Windsor Chapel had no buttresses and therefore no stone vault, and the north transept at Lichfield, which appears to have been the new work mentioned, only had a wooden roof.‡ The question arises, Was the atter the earliest of English "wooden vaults,' and had the King's masters anything to do with it? There are points about the transept doorways which are closely akin to the style of the Westminster master, and I could suppose that he had worked at Lichfield before going to Windsor. The details at Winchester Castle should also be compared with the Abbey work. Stone church seems to be by some mason who worked at Westminster.

I have made a special re-examination of the Windsor work and I have no doubt whatever as to its near connection with Westminster. Not only was the master the same, but the carver of some of the capitals also worked in both places. The Windsor work consists of an arcade of large blind arches along the face of the external wall of the chapel which formed the inner wall of a cloister. These arches resemble those of the Eastern cloister walk at Westminster in function and in many details: in the sections of the arch mouldings; in the fact that the arches have no drip-mouldings (compare the smaller arches next the Chapter House entry at Westminster); in the planning of the piers (two orders in one, three in the other), and the use of extra stout Purbeck shafts, about 7½ in. in diameter; the profile of the bases with the large roll overhanging the part below (Fig. 1); and the

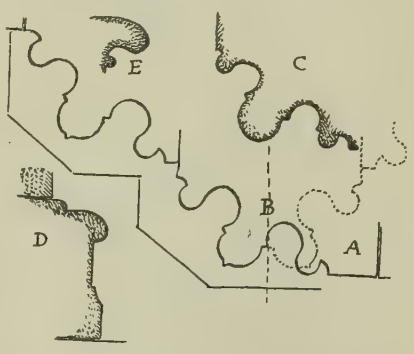

FIG. 1.—WINDSOR. A B C, ARCH MOULDINGS; D, BASE; E, ABACUS.

carved capitals. One of the arches at Windsor is much narrower than the others; this was at the end and doubtless represents the width of a cloister walk; the wider arches rise only to the same height, and are segmental, the centres being some 2 ft. below the springing line. A bold use of such arches is one of the singularities of Westminster; we find it in the Chapter House entry, the diagonal vaulting ribs of the bays of the cloister between it and the church door, the interior of the doors of the north transept, the outer arches of the triforium windows, in a marked way over the Poet's Corner door, and above all in a big wall arcade in St. Faith's Chapel, which is remarkably like the Windsor arcade in scale and general character.§

Sir Gilbert Scott illustrated in "Gleanings" (p. 33) two capitals from the interior wall arcade at Westminster, which were of French character. He wrote: "Many of these are of the English type of the period, but among them are two kinds, both of which are in their carving distinctly French. The one is the *Crochet* capital, the stalks of which are terminated, not as in English work with conventional, but with exquisite little tufts of natural foliage, such as may be seen in the wall arcading of the Sainte Chapelle and many other French works of the period. In the other, natural foliage is introduced, creeping up the bell and turning over at the top. In both the foliage is smaller and less bold than in French work, and the form of the capital is English." Now among the

†From November, 1236, onwards, Master Simon, the King's carpenter, was working at Windsor, and from 1243–4 to 1247–8 he was one of the keepers of the works. He is last mentioned at Windsor in 1249. . . . In 1255 and for some years to come the keepers of the important works then in progress were apparently Master John of Gloucester, the King's mason, and Alexander the King's carpenter, who were also keepers of the King's works in Westminster Abbey" (Sir W. Hope, p. 70).

‡ See a reference in the Life of Sir G. Scott.

§ An interesting study might be made of the special characteristics of the great building masters. He of Salisbury seems to have experimented with half arches; he of Lincoln with unsymmetry.

capitals at Windsor we find ordinary Early English foliage and both varieties of the French fashion, which so closely resemble those at Westminster that they must be by the same carver. In Figs. 2 to 5 I give some sketches from the Windsor capitals, and in Fig. 6 a tuft of foliage from Westminster. One capital at Westminster, to the right of the tomb of the Princess Katharine, has naturalistic oak leaves.

FIG. 2.—WINDSOR.

FIG. 3.—WINDSOR.

FIG. 4.—WINDSOR.

FIG. 5.—WINDSOR.

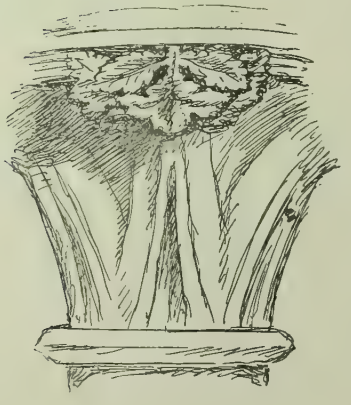

FIG. 6.—WESTMINSTER.

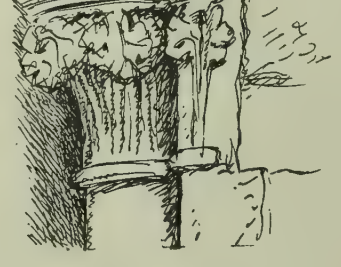

FIG. 7.—WINDSOR.

In the Museum is a capital, of which the stalks of the "crockets" cross exactly like that sketched in Fig. 5. These were carved by the same man! The flat leaves in Fig. 3 may be compared with similar carving on the upper chamfer between the capitals in the East walks of Westminster cloister, now much decayed. Fig. 7 shows a capital at the doorway; notice here the little corbel-like member which comes under the outer mould of the arch. At Westminster these are similar, but more developed. They occur again at Stone, where there is carving, including a dragon in foliage and a negro's head which must be by a Westimnster carver.

The Windsor Chapel was, in regard to the masonry details, the prototype of Westminster Abbey. This fact and the references to Master Henry, which are almost conclusive in themselves, show that he was the architect of Henry the Third's Chapel at Windsor. We thus carry back his tenure of the office of King's mason to 1239–40. He was not, therefore, first employed by the King on the great new church at Westminster begun in 1245.

Coombe Abbey Estate.

The Coombe Abbey estate sale has been concluded at Coventry, when the principal lot offered was the historical old abbey, which had been in possession of the Craven family since 1616. It was withdrawn at £28,000.

CARDIFF DEPARTME OF ARCHITECTURE A CIVIC DESIGN.

AT the Technical College, Cardiff, 10 sch ships, covering tuition fees and mainte grants of £40 per year for three years, are o for competition annually. As candidate entry to the Department of Architecture Civic Design are eligible to compete, scholarships are of considerable interest to contemplating entering the architectural fession.

The scholarship examination is a compe one, and is of about the same standa Matriculation. In the case of candidates f School of Architecture, the subjects of examination are:—(1) English; (2) Math tics (two papers), (*a*) Algebra and Arithm (*b*) Geometry and Mensuration; (3) a m language (French, German or Welsh); Physics with Mechanics, or Higher M matics; (5) History, Geography, or Chem Candidates must further satisfy the Head Department of Architecture as to their a in elementary drawing.

The Department of Architecture at Technical College, Cardiff, has now bee work for rather more than three years und charge of Mr. W. S. Purchon, M.A., A.R.I. the Assistant Lecturer in Architecture bein R. H. Winder, M.A., A.R.I.B.A. Studen the Department also attend courses in Engineering Department, the Technical Ch try Department, the Department of Mathem and the School of Art, all of which Departm are housed in the same building.

This School of Architecture is "recogni by the Royal Institute of British Archit which grants exemption from its Interme Examination to students who pass success through the three years' full-time day c leading to the Certificate. In addition to course, the Department provides a dip course consisting of two sessions of six m each of full-time study, the intervening months being spent in architects' offices. T is also an evening atelier for architects' assis who cannot attend the day courses.

The Department is in close touch with South Wales Institute of Architects, repre tatives of this body being on the Advi Committee for the Department, and studen the School are eligible for the prizes awarde the Institute. In addition to these awards t are also a number of departmental p presented in the main by local architects. External Examiner for the past session Mr. Paul Waterhouse, Past-President of R.I.B.A.

The School year commences on Tues October 2, 1923, but intending students advised to apply at an early date for partic of the courses of instruction and of the Entr and Scholarship Examination. Candidate the latter should obtain application fo which must be completed and submitted b September 17.

Housing in Newcastle.

Newcastle Corporation Housing Comm have issued a report stating that in that the provision of houses with Government sidy assistance under municipal contr necessary. To assist in the erection of h by private enterprise they recommend the Council to fix a maximum lump sum subsid exceeding £100 for each house built by means within the limits of the superficial a the Act. This maximum of £100 represer to £75 the capitalised value of the State su of £6 per year for 20 years. The balance, charged upon local rates, involves an a loan repayable charge over 20 years at £2 4 They propose the following differentiatic the different classes of houses coming with Act:—Not exceeding £100 per house for p type; not exceeding £85 per house for parlour type; not exceeding £75 per h for houses in flats.

BOOK REVIEWS.

ctural Building Construction: A Textbook r the Architectural and Building Student. y WALTER R. JAGGARD, F.R.I.B.A., rchitect, and FRANCIS E. DRURY, F.I.S.E., .C.I. (Cambridge: At the University ess. Vol. I, 2nd edition, 15s.; Vol. II, rt I, 20s.; Vol. II, Part II, 18s.)

series of works on present-day technical es of building published under the title rchitectural Building Construction" com- a great deal of information on points of with some idea of architectural composi- The authors have incorporated in each e the plans, elevations and sections of a te building, and when describing the of construction of certain features have d, as far as practicable, to features shown general plan.

illustrations, too, are designed on this , and are practically detail drawings of part or another of the main building. l of a drawing of a staircase, for example, ut before the reader merely as an example joinery of some possible stair hanging etically in space, the printed heading of ate (Vol. I, No. 168) identifies it as ral plan and section of cottage staircase," nen the sheet of small scale plans of the e is unfolded the position of the stair and racter of its surroundings become evident aneously.

advantages of this arrangement are us to a student of architecture who will ed upon to visualise the constructional of his designs in relation to their main g, and if the bold course adopted by the s of dissecting their own designs some- pens the door to criticism the exercise reader's mind will probably do him more an the criticism itself can do the authors' harm. The type of building illustrated ly exhibits no exceptional flights of fancy. y features constructed in a traditional had obviously to be shown in order that gramme could be carried out. Volume I articularly with the construction of a cottage and a workshop; Volume II and Volume II, Part II, with a suburban house and a town warehouse, thus including a range of various details ample for the first two years of study.

Where necessary the detailed analysis of these subjects is augmented with suggested alternative methods, and attention to the specific problems under discussion has not been allowed to exclude reference to general principles. Chapters 11 to 17 in Vol. II are devoted to the mechanics of structural design, and while close touch is kept with the matter in hand, the theory is expressed all the more forcibly by being applied to the constructions already detailed in the course of the work. A king bolt roof truss for the "workshop" in Vol. I, and a trussed rafter roof truss roof over loading shed in the "warehouse" have been chosen as examples for the demonstration of graphic analysis of stresses in the members. To make the theory more general alternative forms of roof trusses for these and other parts of the buildings have also been included.

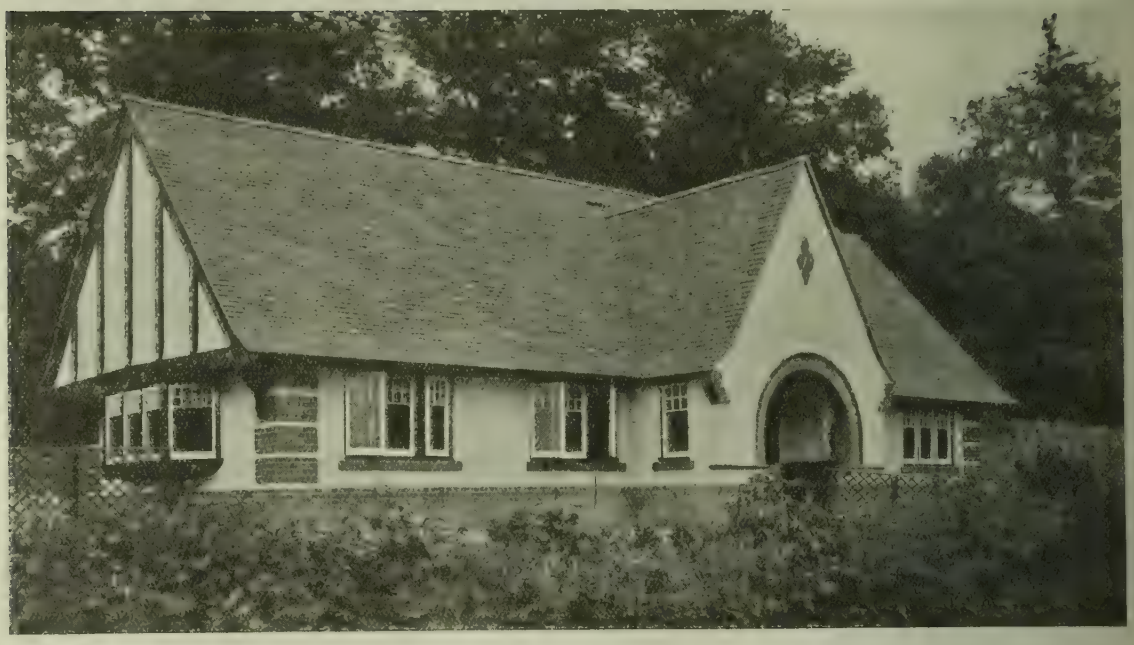
Volume II, Part II, continues the description of carpentry and joinery, sanitation and water supply, internal fittings, glazing and painting, and materials, and maintains the standard of the two former books while adhering to the same programme. The drawings throughout are most satisfactory in that they are without exception lucid expressions of the authors' solution of the problems involved. They are, in fact, also models of neatness and present the information in the pleasantest possible way.

The House We Ought to Live In. By JOHN GLOAG and LESLIE MANSFIELD, F.R.I.B.A. Illustrated by A. B. READ from designs by LESLIE MANSFIELD. (London: Duckworth & Co. Price, 7s. 6d. net).

The opening sentence of the joint authors' introduction suggests the scope of their book. "The house we ought to live in will here be taken to mean a house where work is simplified, cleaning reduced, and convenience increased. It will not contain an unmanageable museum of labour-saving mechanism, nor will it be a costly and spacious palace." A reference to the "partial breakdown of domestic service" as affecting design indicates the fact that houses or middle-class occupiers are principally kept in view.

Within these limits the subject is treated with great good sense directed towards efficiency and the forms of artistic expression that go hand in hand with it. The authors protest against the bad old tradition of house design as if it were stage scenery, and hold up the ideal of the well equipped factory or workshop for the emulation of house designers.

The house should be planned so that its inmates are preserved in health and not occasioned needless fatigue in the necessary daily routine of housewifery; but it is not possible to agree with the authors that "good planning costs no more than bad." For the purposes of this book, Messrs. Leslie Mansfield, F.R.I.B.A. and A. B. Read have produced some remarkably interesting essays in house planning which agree in many points with the suggestions offered in the text, yet even in these admirable plans the relation of the rooms to the points of the compass does not appear satisfactory for houses built north of the Equator. Probably the simple operation of tracing the plans and photo. printing from them through the back, so that the kitchen (and presumably the N. point, which is not shown), would be on the left-hand of the paper instead of the right, would amend matters, but it is just in minor operations of this sort that office costs creep up. And, though the blessing of sunlight where it is needed would benefit householders and their families as long as the house endures, the architect certainly would be out of pocket and would probably find it hard to gain credit for his conscientious efficiency.



Clients are only human and do not always know how to appreciate a house planned on labour-saving lines if they were offered one. Of two plans for houses on open sites that have recently come under our notice, the client knowingly chose the one where the kitchen door was separated by a distance of 30 ft. from that of the dining room and where long dismal lighted passages wasted space. The elevation contained features that reminded him of his native village, and against this sentimental consideration practical efficiency stood no chance. What is perhaps even more significant was that his wife entirely agreed with him.

R.A. Exhibition, 1922.

A Doctor's House, Westerham. MR. CHARLES W. BOWLES, F.R.I.B.A., Architect.

[The principal features of the external parts of this house are: Cream-coloured stone dressings and portico, white stucco between, English oak window-frames and doors, and old tiling to roof. The spaces within the chains and posts are paved with black-and-white knapped flints and stone, forming a pattern.]

West Ashton Village Hall. MR. TERENCE W. SNAILUM, Architect.

[This building has been erected on the side of a steep hill.]

Ship Joinery—Woodwork fittings of a modern steel vessel. By S. G. DUCKWORTH, A.B.I.C.C. (London: George Routledge & Sons, Ltd.) 1923. Price, 5s. net.

Ship joinery differs from ship carpentry in that it concerns the fittings of the vessel and not its main structure. It also stands in a class apart from joinery as practical for ordinary purposes ashore, since the conditions of shipboard life demand a high degree of strength and durability in service and the ability to stand racking strains that shore joinery is never called upon to bear. The external joinery of a ship, too, is required to be watertight and even on occasion to stand the impact of masses of moving water when high seas sweep the decks, and the methods of design and execution adopted by the ship's joiner are directed in the first place by these considerations.

Mr. S. G. Duckworth, in his profusely illustrated handbook, shows the normal type of ship fittings familiar to every voyager, and in his pages the reader can follow the time-honoured craft established by practical men working upon a conservative tradition and adapting their methods to the introduction of new materials with caution and an ever-present realisation of the severe testing their finished work will receive. The artistic side of design is governed by the question of convenience, often with the best possible result, for the few details shown to which exception may be taken on the ground of appearance happen to be those where the designer has felt himself free to substitute the artistic for the "ship-shape." Luckily, economy often helps to preserve the practical man from the excessive use of unnecessary trimmings, and the ship remains one of the most striking examples of beauty arising from the adaptation of means to ends in the most straightforward way.

The articles made by specialist firms often sin against this admirable state of affairs, and the style of commercial art may be detected in the finishings of the cot bed and the folding lavatory that have done so much to cause unhappy passengers unnecessary depression. Both articles of furniture fail in that they disobey the fundamentals of good sense. Ornamental mouldings and knobs with spiky corners are both absurd and dangerous on shipboard, where passengers who have not yet found their sea legs may be flung against them by the motion of the ship. The cabin lavatory basins have the additional disadvantage of being insanitary and creating a nauseating odour in the stateroom, since they are designed in a fashion that makes efficient cleaning impracticable if not impossible.

Improvements in joinery design should involve the elimination of ledges for dirt and the provision of facilities for cleansing, instead of the addition of inappropriate mouldings and ornament. Ventilation is always difficult to arrange under the decks of a ship, and small quantities of dirt lurking in corners of the joinery are far more offensive than would be the case ashore owing to the restricted window space and consequent lack of direct sunlight and free circulation of fresh air, especially in heavy weather.

The geometry of ship joinery, which is obliged to adapt itself to the lines of the ship, is explained in a separate chapter illustrated by three very practical plates containing diagrams showing the effect of combined camber and sheer upon the canted angle of a coaming or the quadrant corner of a deck house. A method of graphic division well-known to practical joiners, but also of great use to draughtsmen, is shown in the first of these diagrams on geometrical method. In some tables of mensuration formulæ given in Chapter XVI, the surface area of any prism is represented as "perimeter of base × length," a formula which ignores the area of the two ends. A similar omission is made in the case of the cylinder whose surface area is tabulated as $\pi d \times l$, where d = diameter of base and l = the length of the cylinder. These slips are, however, exceptional in what is, in other respects, a remarkably well-written handbook.

A History of Everyday Things in England. Vol. I. By MARJORIE AND C. H. B. QUENNELL. (London: B. T. Batsford, Ltd.) Price 8s. 6d. net.

In these days of a multitude of books it is refreshing to come across one on original lines. It would, probably, be true to say that the educated Englishman knows more about the domestic habits of the ancient Egyptians and of the Greeks and Romans than he does of his mediæval ancestors, and, while this volum intended primarily for the child, it also pro a mine of information, attractively prese for the parent. How many men realise the significance of the word "convent," or familiar with the development of the Br ship, windmill, game, or costume?

Many toys and contrivances designed amuse or instruct the young are seized "grown-ups," and the book under review probably, share the fate of these toys, especi seeing that the authors have indulged ra freely in long words and technical terms w would require explanation to small child One would like to advocate it as a history for the use of schools, since, unlike the stand works on history, it deals with the lives of people, and not with a series of dull statem and dates. How can one expect a child t other than indifferent to the alleged fact taught to the present generation, that "Matil overbearing and arrogant disposition alien her warmest supporters"? Here we are that "John was a thorough bad lot"; h the child feels that it knows something al John. John is definitely classified.

The excellent illustrations have all b prepared by the authors and, with the le press, must have entailed a great deal of la and research. The close parallel between development of architecture, of ship de and of costume is strikingly presented; we trace the purity and simplicity of the F English working through to the intri elaboration of the Perpendicular. One c wish that the description of the fan vaultin Henry VII's Chapel had been easier to un stand, and, possibly, this might have achieved by some skeleton diagrams and ra less of technicalities.

Not everyone will agree with the statemen page 2 that the French in the tenth century "then as now the cleverest people in Eur and the authors are definitely caught trip on page 118, where they tell us that moor have little red feet. It is satisfactory to that this is the fourth impression, and tha volume is not sharing the fate of so many b that are worth reading; and one can only clude by expressing the hope that the se volume will be as pleasant, readable, instructive as the first.

Architectural Association Schools Students' Work

Design for a Concert Hall and Seaside Lay-out. By Mr. E. Wamsley Lewis (Third-year Student).

[Plans of this design, and other A.A. Students' work, were given in our last issue.]

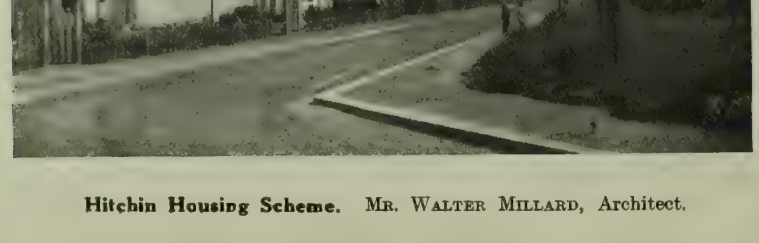
ORGANISATION OF THE ARTS AND CRAFTS.

By JAMES GUTHRIE.

ANYONE having a fair acquaintance with the history of what is known as the Arts and Crafts Society and its kindred in England from the time of Morris to the present day, and who understands the significance of handicraft as the reservoir of new impulses in the arts and manufactures, will be disposed to mix his welcome of the recent conjunction of effort at the Royal Academy with some reflection.

It is evident, for one thing, that the Press, which employs critics who can write about painting, is not alive to the importance of a movement always treated with an obvious lack of enthusiasm, and left without the publicity which it deserves. A critic who is able to find in any average exhibition of pictures the material for a discussion is not necessarily gifted with the knowledge by which stained glass, ceramics, weaving, metal work, etc., can be dealt with. His ordinary resort is to a species of faint praise, or the assumption of superior taste mainly used as a smoke screen to hide his retreat from a task obviously beyond his capacity. Even on the subject of mural painting the student may look almost in vain for anything like real guidance; for the study of this art suffers as much from the same indifference towards those handicrafts as they suffer from the lack of a tolerable setting in home or hall.

Criticism, if efficient and constructive, might do a good deal by way of improving the standard of work, rebuking wrong tendencies, and correcting the popular taste. But its present standpoint is against the intelligent apprehension and without respect of men whose work brings them to the daily tussle with the material, and who have so far done without that public notice which it is the custom of our time to regard as the appendage and property of one branch of art. That there is something against the prevailing spirit in the arts and crafts may be admitted at once. The tradition is still apt to be derived from Morris and Burne-Jones, and the modern element is rapidly losing character by dallying with commerce without the necessary bias by which alone manufactures can be served by the arts in the fullest measure. Individually and as a whole the arts need to be brought to the test. The artist and the art worker must come together, and must learn from each other. Architecture must provide the framework, and be enabled to form itself with reference to possible enrichment. It is not enough if we are left the thankless task of inventing knights and angels, or of putting together stone and metal merely from a recollection of how these have been used and admired in times past. The extraordinary thing is, not that the arts suffer, but that they do not extinguish themselves by their persistent archaism, or by their failure to take a bold step in the face of public neglect.



One never hears a new argument when men wish to point the old moral about art as a luxury; yet it is no more true than it has ever been that the arts can be done without. Cheap goods as well as expensive goods may be luxuries in the sense that we possess them with less persuasion and less need, and regard them more fondly on the whole than we do the many unnecessary embellishments which custom foists upon us—the knobs on our bedposts and the patterns that vex so much of our domestic surface.

The activity of mind and hand seen in any tolerable work of art or handicraft is superior and eventually of more practical importance than much that is recognised and paid and cultivated in offices and factories. We only learn too slowly how to make use of formative talents, giving them no scope for expansion, just as, at the beginning, we leave their event to chance.

One may also note the division of art into "fine arts," minor arts, and commercial art. These are purely fanciful, but they are industriously used to weaken and diminish the compact sense in which all the arts and handicrafts originally stood together. Painters seeking a wide field for their work have been compelled to find a footing and a relationship with other forms of decoration. They have begun to see new significance in sculpture and woodwork where before they regarded their pictures as unrelated but dominant objects; they have sought for fresh clues in among the fixed conditions of the wall, which have never till now seemed to matter. Much, it may be assumed, of the literalism of modern painting will disappear under this discipline of place. Breadth will have a new meaning for those who are faced by the conditions under which wall painting has to be done, and the ordinary academic subject-matter also will undergo many drastic changes, very much to its improvement.

The most obvious alteration in the character of the work that it is to be hoped will be afforded this revival, is from solitary individualism to an older and rougher companionship. Interesting as the intellectual aspect of painting is, it threatens the manliness and vitality of art. Preciosity, dull and intricate learning, a too narrow regard for skill, do not expand—they destroy. When your curator and professor have bound art hand and foot, they are not any more in the story except f mischief. For years past painters have soug new methods with much ingenuity and r source; but what they need is not ne methods. Their poverty lies partly in t absence of ideas and partly in the lack space. They need, that is to say, bett education, more experience of men, and wal The conflict which a large hard wall can trusted to set up can equally well be trust to make a workman of an artist, if it do not beat him altogether. And in the proce he will regain lost ground, and be wean from his dependence upon the comfort whi curators and professors take for granted as portion of the true faith. There are wa in which other arts may attain a degree efficiency not within the usual limits of sch and workshop. Everywhere in the recent e hibition at Burlington House, and in othe in London, one feels the same lack of re impetus. It is as though an appeal were bei made to the West End by all the faded a bygone tricks. What one man attempts glittering little pieces of silver, or mother-pearl in iridescent slabs, or raised gold lett ing, another attempts by huge painted figur or leaded glass. One realises that with demand arising from the actual capacity the arts to serve a real purpose of which th are themselves aware, this appeal to the we to-do represents a sadly hopeless frame mind. Yet, to turn in the other direction a seek a use and a welcome in among the liv and homes of the ordinary people; to establi a place for the craftsman in which his labo may always be found to have a bearing up progressive manufactures, has all the virt of good sense, and is a great deal more exc ing in the long run. The luxuriousness of does not lie in its care for beauty; in t enjoyment got from or bestowed by it; in t costliness of it. The only case against t arts and the crafts is that they are dislocat misdirected, put from democratic usage. T worn-out shreds of rich patronage are lo since far too expensive and wasteful. Aris cratic ideas on the part of the artist may ha some bearing upon the mien of his work. h they have no social or political significan and no power to bring duchesses to his do Romance changes about. Art is still lon and Time still hurries men and modes in oblivion. We cannot afford to support t dismal properties which drag us away fr living sensations about men and things, a plant us among knights and monks. Co petent workmanship of itself is too litt Skill may be, and often is, utterly divorc from any tolerable occupation. The cas ordinary visitor at a show of pictures or han crafts might wonder in what strange forest many-towered city this array was fashion and be immoderately surprised to learn hermits buried in his own suburban str in the intricacies of Mallory, or engaged monkish revivals, blissfully detached fr their own time. Being curious about matter, we may even doubt the desirability setting forth elaborate compositions of figu in public places without more warrant th is to be seen for so serious a step. A fra idea enlarged upon a wall undertakes m than when it occupies a frame of mo dimensions, and needs a better or differ excuse. A wall treated as though it must hook or crook be filled with narrative allegory does not seem to meet the case. the one test of mural painting is the w not the study or the studio, and the o obvious practice for the student is the w of his own home and his own school.

Nobody could follow the development of decorative arts in this country without fee that one radical step towards a reunior these with architecture, if it could be bro about, would be worth more than any o scheme of promotion. Why is this not sible in the most explicit form? Why t the artist and the craftsman be require form an irresistible alliance before the a tect admits what is already palpable? M

Hitchin Housing Scheme. MR. WALTER MILLARD, Architect.

Hitchin Housing Scheme. Mr. Walter Millard, Architect.

inters already produced in England a antity of work without gaining any recogni-n. Men who know something of the con-ions and have taken such risks as there are, ght, without undue favouritism, be trusted th some of the practical training. Small d select groups, like the Century Guild and e Clergy and Artists' Association, have eady shown the way to organise and join rces for some definite end. To-day it is the tivity of such bodies which is lacking, with eir workmanlike enthusiasm and actual ex-rience. The new Society of Mural Painters ust not be allowed to suffer extinction by e belated discovery of this art in official cles. In fact, it is as a group of workmen at artists will find their work, and at the me time a connection with the public at rge.

Exhibitions are a device to be made use of, t not permitted to rule the arts. Even if ey succeed in effecting sales, and in taking ver at the turnstiles in quantities, and in nning social functions, whatever sympathy ese good offices evoke, they must not be nfounded with progress or even prosperity in t. Possibly these large glittering exhibi-ns blind the public to many brave and des-rate labours, throwing a haze of gold and ther-of-pearl over drab and difficult lives. is is indeed no guess-work: it is true. A w is not so much a glory as an expense, which in art there are far too many.

The general belief is that a love of art is nulated by gathering a quantity of it to-her. A better way would be to create a ntaneous form of art on the walls of our nes. With what delight one finds a bit simple design, some flower or bird, painted a white wall, or embroidered on a coverlet! e realises that art, despite its fashionable its large enterprise, its following of pro-sors, curators, and critics, is a home-made duct first and last and all the time. And ht not this be the clue which we need to e us away from the ineffective pursuit big business, our fancy for Italian pre-ent, our ambition for enormous and un-ly official appointments?

very artist has his own home, his own tives, and neighbours. Rather than twist-his gifts into some crooked shape in order all in with a wretchedly inefficient system h can never serve any permanent good, does he not form definite local groups take a hold upon the opportunity that lies is hand? For, so long as art is pooled the benefit of dealers and societies or ralised in London, every artist is beating air, and letting slip his one chance of g recognised plainly and sensibly among men in a useful capacity.

hat is true of painting is true of all the ticrafts also. The high indifference of the spaper critics to these is very noticeable. ost without exception they take cover, not recognising the fact that the handicrafts have done more to keep the love of beauty alive in the home than anything else. There is a danger of the Arts and Crafts Society disappearing from view, because it has no independent policy, and perhaps too little opportunity as a body for the necessary organisation. It suffers, moreover, from the domination of an element of mistaken archaism and that of a modern group intent upon bringing handicraft into the different atmosphere of commerce. While one opposes progress by keeping a stale idea of tradition on the surface, the other works against a living spirit by reducing the freedom and the natural curiosity of the craftsman. And if this body, commonly regarded as representative of what is best in present-day handicraft, persists in falsifying the values and distorting the facts, the formation of independent groups will inevitably undermine its position in order to bring about ends which can never otherwise be achieved. The business of a society is to represent all groups, not to place one or two in authority.

In detail, these adjustments might well appear to be beyond the power of any association of men who have their own personal labours in addition to such service as they give for the general good. This service, it must be admitted, is considerable. The point, however, is that, although the difficulties cannot be gainsaid, there is no explicit or generally understood direction beyond the immediate enterprise of a meeting or an exhibition. And it is obvious that, without a larger conception of how the artist and the craftsman stand in relation to other men, no single effort can serve as much as it should. We may doubt if these solitary attempts at rallying the work of years do effect a great deal. They emphasise the more clamorous forms of art, and are a testimonial to the survival of many things which in the interval had been invisible; but in the realm of mural painting, and in certain handicrafts, no true judgment can be arrived at from an exhibition. A larger grasp of the whole question is, therefore, necessary, and should be pressed for by every possible means if the unresourcefulness of the arts in their own interests is not to become a byword and a reproach.

Small guilds and industries and shops are capable of affiliation at least in some simple, recognisable fashion. Usually they are neglected, and either disappear or become the servants of some already well-provided and protected trade, to the detriment of all that is worth while. The principle of trade unionism in the arts, in fact, was never more favoured than it is at the present time by everybody who needs—and who does not?—the moral support of organised citizenship. For, although this savours of politics, and, as such, may be considered by many as aside from the subject, no practicable organisation of art workers can afford to exist without admitting the human claims as essential and proper. It has been tried to decide on the score of talent and reputation—both variable and uncertain. The "great artist" can be, and usually is, a nuisance among his fellows. It is not for him that we press the need for a community of interests, for more energy and opportunity. In a wide sense an artist has leave to be a bad artist. That, anyhow, will decide itself. A greater danger would be, and has ever been, the predominance of those who find the rotten old system good enough for all they require. They block the gangway, ridicule progressive ideas, drive out men who are more susceptible than themselves to the claims of new talent. They are the allies of the dealer, the cronies of the philistine, great at revels and fancy dress balls! It is in such hands that art becomes tainted with the world, the flesh, and the devil, a plaything and a luxury ranking with cigars and champagne, but with none of their attraction.

There is always ample room for all kinds of men in every profession. Artists are capable of looking, and being, exactly like aldermen or stockbrokers. It is, nevertheless, vitally important that they should, as a whole, be workmen in the plain ordinary sense of the word; for if they are not, their appearance in another character will not save them. A lucid, well-considered policy, a large grasp of present-day conditions, a practical alliance with architects and builders, and a solid determination to keep in the forefront, will easily achieve all the rest.

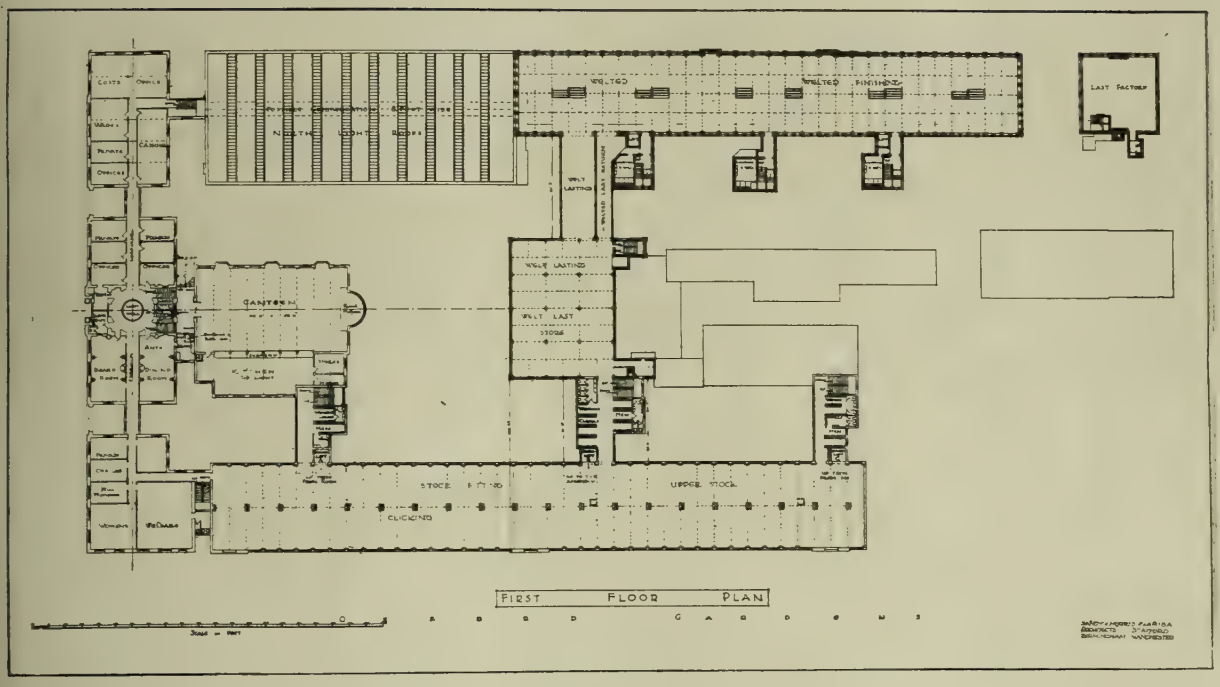
Hitchin Housing Scheme. Mr. Walter Millard, Architect.
[Plans of these houses were given in our issue for July 28, 1922.]

New Offices at Stafford for Messrs Lotus, Ltd.

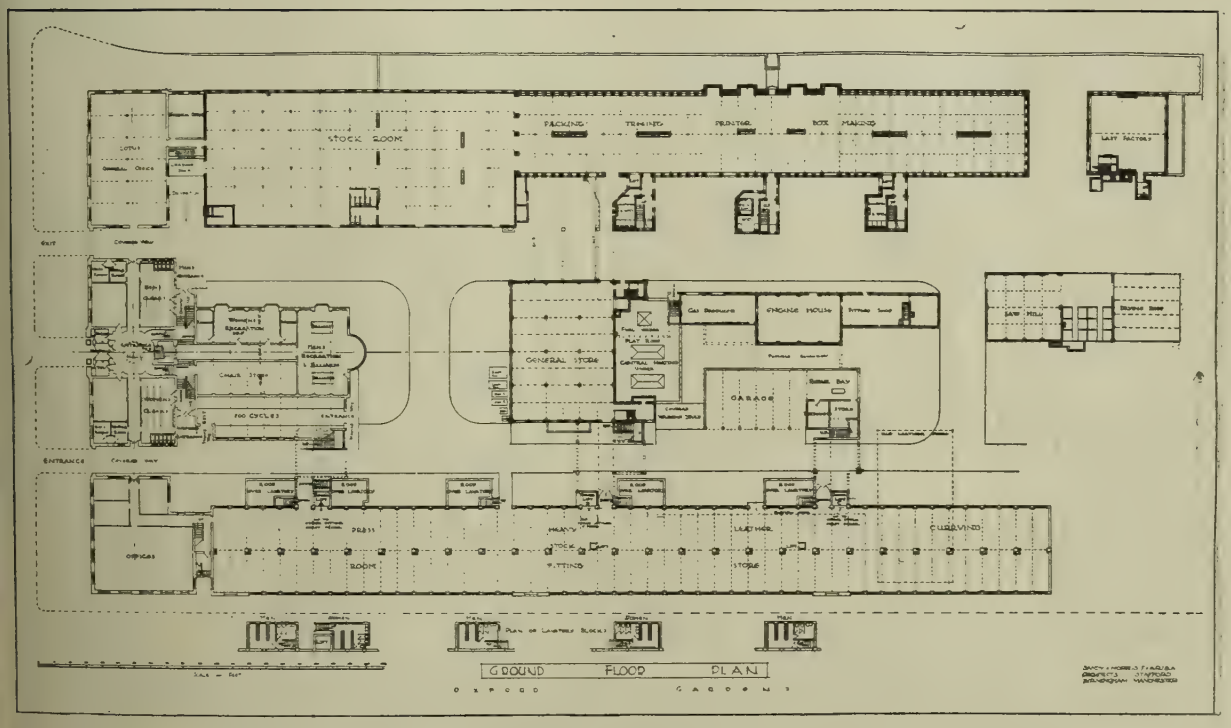
MESSRS. SANDY & NORRIS, Architects.

NEW OFFICES AND FACTORY AT STAFFORD.

THE first sod of this building was cut on August 22, 1921, and it was completed at the end of January last year. The building is a steel frame fire-resisting structure, faced with Ravenhead rustic bricks and "Empire" stone dressing. The lower floor is intended entirely for stock purposes, and the upper floor is divided by glazed screens into private and general offices. The ventilating system is a combined low-pressure hot-water system (accelerated), with radiators beneath the windows and a plenum system. The ducts for the latter system are carried alongside the main girders underneath the first floor. From these the outlets are formed around the stanchions, which were previously cased in concrete, and carried downwards to the ground floor through ducts formed of breeze slabs. The outlet on the upper floor is merely a box around the stanchion, which again is cased in concrete. Regulators and gratings are inserted to control the flow and pressure of air. The whole building is protected by sprinklers, installed by Messrs. Mather & Platt, Ltd. Although the floor area is large it is found that there is ample light even in the centre of the rooms.



The complete scheme, which is intended to double the output of the present factory, will take several years to complete, but the second portion is now well towards completion.



The architects are Messrs. Sandy & Norris F. and A.R.I.B.A., of 22, Greengate, Stafford The general contractors were Messrs. F. Espley & Sons, of Stafford, and the sub-contractors included the following:—Steel work, Lambourne & Co., Ltd. (Manchester); fire-proof floors Diespeker & Co., Ltd. (London); patent composition flooring, Jos. F. Ebner (London) asphalte, Val de Travers Paving Co., Ltd (Birmingham); steel windows, Williams Gamon & Co., Ltd. (Chester); plumbing painting and glazing, H. Pratt, Ltd. (Birmingham); heating and ventilation, Couzens & Akers, Ltd. (Birmingham); facing bricks, Ravenhead Brick & Terra-Cotta Co. (St. Helens); stone dressings, The Empire Stone Co., Ltd. (London).

THE BUILDING TRADE.

PROSECUTION UNDER THE RENT ACT, 1920.

The Times, August 27, a prosecution under Rent Restriction Act, 1920, is reported, and here have been few such cases reported it ld be noted.

e report is brief and not entirely satisfactory, does not state the sections of the Act relied nor whether all the premises referred to let with furniture. According to the report efendant was the owner of a house and shop, ent of which was 25s. a week. He himself pied the shop and a parlour and let off other s of the premises. One tenant paid 14s. a for a furnished room, another occupied a en and scullery for 18s., and two other s were let for 14s. and 12s. respectively. As ave said it is not stated whether all these s had furniture, but the total amount ved was £2 18s., the owner retaining the f the shop and parlour.

ction 10 of the Act of 1920 provides where person lets any dwelling house or any part eof, to which the Act applies, at a rent which des payment in respect of the use of iture and the rent charged yields to the r a profit which, having regard to all the mstances of the case and in particular to margin of profit allowed under section 9 of Act, is extortionate, then without prejudice ny other remedy under the Act the lessor l be liable on summary conviction to a fine exceeding £100 and the Court by which he nvicted may order that the rent so far as it eds the amount permitted by section 9 l be irrecoverable and that the amount of excess shall be repaid to the lessee, but any order shall be in lieu of any other method ecovery prescribed by the Act.

ction 9, subsection (1), refers to civil pro- ings in the county court and "the margin of t" is defined in that section. This section applies to houses or parts of houses let the use of furniture, and proceeds "and if proved to the satisfaction of the county t on the application of the lessee that the charged is yielding or will yield to the r a profit more than 25 per cent. in excess he normal profit as hereafter defined," the t may order that the excess shall be irre- rable and may be repaid to the lessee.

subsection (2) "For the purpose of this on, 'normal profit' means the profit h might reasonably have been expected a similar letting in the year ending August 3, "

e only amendment made in the above ons, 9 and 10, by the Increase of Rent Act s year, is that by section 10, subsection (2), declared that in these sections the ex- ons "landlord" and "tenant" shall tively be substituted for the expressions or" and "lessee."

h being the material sections of the Acts, y be noted that the prosecution was taken section 10 of the Act of 1920, and the trates fined the defendant £2 10s. in each with certain costs, and made an order that und of £10 8s. should be made to the of the furnished room, who paid 14s. as und a refund to the tenant of the kitchen cullery, who paid 18s., of £11 12s.

tenants of the other two rooms mentioned report apparently were not parties to rosecution, or the rooms were not let urniture, for they are not mentioned.

magistrates appear also to have fixed the the two tenants to whom the refund was at 10s. in the future. There seems no in the section for such a declaration to be but a defendant would hardly risk a prosecution. The correct course would to apply for a declaration of the rent section 11 of the Act of this year, but pplication would be to the county court.

PAYMENT BY RESULT IN THE BUILDING INDUSTRY.

In the course of a letter to *The Times*, Mr. Roland B. Chessum, Past-President of the London Master Builders' Association, expresses agreement with the opinions put forward in that journal that if we are to face with any confidence a boom in trade, some such system as that advocated [payment by result] must be adopted by British industry, and what may be acceptable to one trade may not be acceptable to all the trades concerned. Obviously some trades, and some kinds of work in each trade, will lend themselves to a system of payment by result, whilst any enforced universal adoption of such a system could only end in failure.

"What I think we ought to do," he states, "is to face the great need for this proposal and then determine the best method for bringing it about. Much investigation of a very careful kind may be necessary in some trades. Who is to make such an investigation, and who is to act on the report which should follow? Lord Askwith proposes that the powers of the Industrial Court should be expanded to cover such investigations, and if this were done, could or would the Minister of Labour act on the findings?

"Mr. Pybus proposes the setting up of district appeal tribunals. Does not this suggestion and that of Lord Askwith merit attention by those in authority in the different industries, and even by governing Departments, such as the Board of Trade and the Ministry of Labour? No investigations will give the practical result needed unless opposition from either employer or operative, or both, can be overcome. Individually, I find working men in favour of payment by results. What they ask for is a guaranteed time wage below which their earnings cannot fall, and security against the cutting of rates. What the employers need in order to hold their own in the markets of the world is an intensive output. In some trades the demand may be a fixed one, but in others, such as engineering, no limit need be placed on its potential expansion. Mr. Ford has taught us this truth, and created a market for his products and security against unemployment of his workpeople. What, then, are we going to do about it?

"In the building industry a proposal has been laid before the operatives' officials whereby a man, or group of men, being paid by the hour at the standard rate, should, on their output being measured and valued at rates in an agreed schedule of prices, receive as a bonus for their increased efforts any surplus over the aggregate of the wages they had received. This would assure to them the guaranteed time wage, and would be an inducement to the individual, or group of individuals, to excel in both industry and proficiency.

"If the proposals could be tabulated and referred to some body, such as the Industrial Court, as Lord Askwith proposes, with power to take evidence and present a report, much misconception might be removed, and a plan evolved which would place Britain in some measure of equality in facing competition and winning new markets, without which many trades will find resuscitation difficult, if not impossible. Such evidence, given on behalf of the building industry, might produce a lot of useful information, which would enable the employers and employed in that industry to come together and find some satisfactory working arrangement. The question is one not for employers or workpeople only, but one on which the whole nation is entitled to be interested, and on which, finally, it must boldly express its opinion, and only in so far as it knows the facts can this be intelligently done."

OBITUARY.

The death has occurred at his residence, 24, Tankerville-terrace, Jesmond, of Mr. Edward Johnson, aged 85, who was a builder and contractor in Newcastle for many years.

The death occurred, at Brighton, on August 21, of Mr. Francis Jukes, managing director of the Silicate Paint Co. Mr. Jukes entered the Silicate Paint Co., at Liverpool, in 1878, and it is largely due to his efforts, seconded by his co-director (Mr. Hugh Watson), and by his son (Mr. Edward Jukes), that "Duresco" has become so well known.

The death has occurred at Prospect-place, Llanelly, of Mr. John Lewis, builder, in his 68th year. For some years he was the treasurer of the Llanelly Rugby F.C. and was widely known.

Messrs. Sandy & Norris, Architects. (*See p.* 374.)

EXTRAORDINARY TRAFFIC.

An action of an unusual character has been the subject of decision in the House of Lords in the case, Glasgow Corporation *v.* Barclay, Curle & Co., Ltd. (*Weekly Notes*, August 25).

It was a Scotch case, and, as the Corporation had not adopted the legislation relating to extraordinary traffic in the Roads and Bridges (Scotland) Act, 1878, the action was brought at common law. The Corporation were suing the respondents for damages caused to the streets of Glasgow by their traffic. The respondents were boiler makers, and the traffic complained of was boilers weighing from 60 to 80 tons. The respondents pleaded that the traffic was not extraordinary or excessive, having regard to the locality and the nature and extent of the industries carried on therein, and that due care had been exercised in the conveyance to prevent unnecessary damage, and it was proved that traffic of this nature had been carried on in that district for twenty-five years past. The House of Lords, affirming the Courts below (Lord Birkenhead doubting, but not dissenting from the judgment), held that, though an action at common law would lie for an abuse of the highway, in this case, as the weights were not greater than those which for many years had been conveyed over those highways, and as the usual precautions had been taken to minimise damage to the streets, the action failed.

The case is only reported at present as a headnote, and it may be assumed that, on this point, there is no difference between the common law in Scotland and the common law here; but our Highway Acts are of universal application, and the legislation as to extraordinary traffic does not depend upon whether a local authority has adopted it or not, so a similar question is hardly likely to arise in this country.

CONCRETE ROADS.

A second edition of "Concrete Roads" is now ready, and may be obtained from the office of *The Builder*, No. 4, Catherine-street, W.C. 2, price 5s. net. The book deals in a thorough manner with the methods of construction adopted in this country and abroad, its chapters including Concrete Roads in England, Scotland, Wales and Ireland, with latest official reports as to their condition, weight of traffic, maintenance cost, &c.; Concrete Roads in Industrial Works; Concrete Roads in Other Countries; Mechanical Appliances used in the Construction of Concrete Roads; Concrete Kerbs and Channelling, Fence Posts, Telegraph and Lamp Posts, &c.; Useful Hints for Making Concrete and the Choice of Aggregates. A valuable feature is a Suggested Specification for the Making of Concrete Roads, which has been prepared by well-known engineers who have had great experience in this type of road, and which embodies the experience gained both in this country and in the United States. The book is well illustrated throughout, and the particulars of the methods of construction used by different Borough Surveyors, tabulated for ease of reference, should be particularly valuable to those about to lay new roads. This volume is the only work published dealing exclusively with concrete roads, and it has been brought up to date to include the very latest ideas and methods.

The Royal Sanitary Institute.

The autumn term of the Institute courses of lectures and demonstrations begins on September 24, at 5.30, with an introductory lecture by Prof. H. R. Kenwood, C.M.G. Admission to this lecture will be free. The other courses will be as follows:—Sanitary officers, commencing September 25; health visitors and child welfare workers, October 1; and meat and food inspectors, October 5.

WATER BOARD RIGHTS.

At Marylebone Police Court recently Whitbys, Ltd., contractors, of Eagle-street, High Holborn, were summoned by the Metropolitan Water Board for using for other purposes the water supplied to them for domestic use at houses in Highgate-road.

Mr. Collins, prosecuting for the Water Board, said that no allegation was made that water was taken with the object of defrauding the Board, but the firm were accused of taking water with the direct intention of challenging the Board's rights under their statutes. A person paying the water rate was entitled to the supply of water for domestic use, but if water was wanted for any other purpose some arrangement must be made with the Board. It was alleged that the defendant firm used the water for building purposes in the mixing of concrete. The premises were under reconstruction, and the charge for the supply of water would, perhaps, amount to two guineas at the most.

Mr. Octavius Sutton, an official of the Board, stated that the contractors had no authority to use water for building purposes.

Mr. W. E. P. Done (for the defence): Do you agree that it has been the practice of builders in London not to give any notice, and for the Board not to require any notice of alterations and repairs of houses?

Mr. Sutton replied that for sixteen years the Board had insisted on it whenever it had been brought to their notice. At a later stage he said that the old Water Company might have recognised the practice, but not the Board, which had been applying pressure in order to stop a growing practice.

Mr. Done contended that the object of the Act was to prevent the abuse of the owner's or occupier's agreement with the Board, and was never intended to apply to a casual use of water, as in this case.

The hearing was adjourned in order that the case might be argued fully.

LABOUR HOUSING CONFERENCE.

A national conference on housing, rati and railway rates, organised by the Lab Housing Association, was held at Plymo last week.

Mr. J. B. Williams, Chairman of the Gene Council of the Trades Union Congress, w presided, said it might cost more to prov decent houses in suitable surroundings, bu general improvement in the health of the peo would save millions in the long run in t national health bill.

The Union of Post Office Workers move resolution condemning the financial provisi of the new Housing Act, and expressing t opinion that good houses built on garc suburb principles on the best available sites a let at low rentals could only be provided local authorities being empowered to acqu land on the basis of its value as ascertained f purposes of taxation, and being allowed to ere houses out of the rates, with financial assistan from the Treasury.—The resolution was carri

Mr. C. T. Cramp (National Union of Ra waymen), who represented the Labour Par Executive, said they could not hope to sol the housing problem until they dealt wi rings, trusts, and combines. Legislation shou be initiated to control the prices of buildi materials.

The conference passed a resolution deman ing that the local authorities should ere houses of not less than five habitable apar ments, with electricity, bath-room, and hot a cold water laid on.

Whalley Abbey.

Practically the whole of Whalley Abbe Manchester, has now been purchased. T abbey stands secluded from the town. N much of the building remains, except the low part of the wall.

AGES AT SEWERAGE WORKS.

HE Industrial Court, Westminster, has ounced the award to be paid to the men loyed on the sewerage works of the Llan- nt and Llantwit Fardre Council. The issue remitted to the Industrial Council after a ing at Cardiff on August 14. The matter re the Court was whether the navvies' and urers' wages on the sewerage works in stion should be under Grade I or Grade II terms.

he Council had contracted for works at 000 to relieve unemployment in the district had paid rates applicable to Grade II area er the scheme of the Civil Engineering Con- ction Conciliation Board, viz., 1s. 1d. per r. whereas the Altogether Builders' ourers' Society, on behalf of the men, med rate under Grade I area, viz., 1s. 2d. hour. Neither the local authority nor the n was a member of the Conciliation Board e l

he Court, in award, pointed out that the only s of the area which at present could be con- red industrial were such places as Gilfach h. Pwllpant. Tynlwydd, Pontyclun and ıtrisant. If new pits were opened in the rict, as was contemplated, and the popula- increased, the character of the district ht change. but the award had only to deal the present. Having regard to the neigh- rhood where the sewerage works were being ied out, the Court decided that Grade I was the appropriate rate and that the rate to be was Class II area rate.

he signatories to the award are Sir William kenzie, K.C., Mr. Ernest J. Brown, and Mr. Sutton.

NEW BUILDINGS IN LONDON.

xford-street.—REBUILDING.—The contract the rebuilding of 29–31, Oxford-street has ntly been placed with Messrs. O. P. Drever n (Kettering), Ltd., 141, New Bond-street, . The sub-contracts so far placed com- :—For constructional steelwork, The Aston tructional Co., Ltd.; fireproof floors, s. Homan & Rodgers, Ltd.; sanitary and ing, Messrs. Stitson, White & Co.; terra- front, Messrs. Shaw's Glazed Brick Co.. steel windows, The Taylor Manufacturing Ltd. Mr. S. Gordon Jeekes, of 4, George- . Hanover-square, W. 1, is the architect.

entford.—BANK PREMISES.—Messrs. John nus. Ltd., of Hammersmith-road are ing new premises at 100 and 101, High- . Brentford, for the Westminster Bank. The structure is of brick and stone, and s. Crickmay & Sons, 13, Victoria-street. minster, are the architects. The cost will proximately £8,000. and the sub-contracts een placed.

mmersmith.—HOSPITAL.—Messrs. John nus. Ltd., are completing the Hull Martin Operating Department, and Paying ts' Department at the West London al. Hammersmith, at an approximate f £37.000, from drawings prepared by . Alban H. Scott, architect, 13, Old- Lincoln's Inn. Sub-contracts have not en placed.

Proposed New Secondary School.

e scheme proves eligible for Government ce the Bradford Education Authority to proceed with the erection of a new ar School for Thornton at an estimated from £90,000 to £100,000. At present re over 200 scholars, and there is only nodation for 120. The schoolmaster's s used for classrooms, and the Kipping School is also utilised as a makeshift. st Riding County Council is expected to ute financially to the scheme.

RATES OF WAGES IN THE BUILDING TRADE.

The following are the rates of wages in the building trade in England and Wales. Every endeavour is made to ensure accuracy, but we cannot be responsible for errors that may occur :—

	Masons.	Bricklayers.	Carpenters, Joiners.	Plasterers.	Slaters.	Plumbers.	Painters.	Masons' Labourers.	Bricklayers' Labourers.	Plasterers

(For rates of wages in the Building Trade in Scotland, see page 382.)

CONTRACTS, COMPETITIONS, &c.

For some contracts still open, but not included in this List, see previous issues. Those with an asterisk are advertised in this number. Certain conditions beyond those given in the following information are imposed in some cases, such as that advertisers do not bind themselves to accept the lowest or any tender; that a fair wages clause shall be observed; that no allowance will be made for tenders; and that deposits are returned on receipt of a bona-fide tender unless stated to the contrary.

The date given at the commencement of each paragraph is the latest date when the tender, or the names of those willing to submit tenders, may be sent in; the name and address at the end is the person from whom or place where quantities, forms of tender, &c., may be obtained.

PROPOSED NEW BUILDINGS & OTHER WORKS.*

In these lists care is taken to ensure the accuracy of the information given, but it may occasionally happen that, owing to building owners taking the responsibility of commencing work before plans are finally approved by the local authorities, "proposed" works at the time of publication have been actually commenced. Abbreviations:—T.C. for Town Council; U.D.C. for Urban District Council; R.D.C for Rural District Council; E.C. for Education Committee; B.G. for Board of Guardians; L.C.C. for London County Council; B.C. for Borough Council; and P.C. for Parish Council.

ABERDARE.—The extension of the Aberaman, Aberdare, generating station of the Powell Duffryn Coal Co. is to be undertaken, which will involve considerable building work. Plant, however, has already been ordered.

ABERGELE.—Plans passed by the U.D.C.: House for the Countess of Dundonald.

ACCRINGTON.—The possibility of utilising more fully the river water from the weir at the Old Corn Mill, Accrington, for the electricity undertaking, is to be reported on by the Borough Engineer (Mr. Newton) and the Electrical Engineer (Mr. Clegg). The Employment Exchange having proved too small, the former post office building in the Church-street Arcade has been taken over.

AMPTHILL.—Plans passed by the U.D.C.: Extension of the Cottage Hospital.

AMMANFORD.—In order to facilitate water supply, the U.D.C. has decided to lay additional 9-in. mains at estimated cost £4,400. The Council is also considering the supply to the Cwmamman district which would involve considerable main laying.

AMPTHILL.—Plan passed by the U.D.C.: New buildings at 17, Church-street, for Mr. F. Nott.—Plans passed by R.D.C.: House, Holt Estate, Aspley Guise, for Mrs. Lloyd; two houses, near recreation ground, Flitwick, for Mr. C. E. Shrives; house, Station-road, Aspley Guise, for Mr. E. H. D. Image; house, Marston Caulcott, for Mr. Harry Roberts; two houses and workshop, Ampthill-road, Maulden, for Mr. W. H. Taylor.

BANBURY.—Plans passed by the R.D.C.: House at Adderbury East, for Mr. C. P. Stanton; implement shed at Mollington for Banbury Co-operative Society, Ltd.

BARKING.—Among the schemes put forward by the U.D.C. for relief of unemployment is the extension of Barking Park lake, at an estimated cost of £10,000 to £12,000.

BEDWELLTY.—The U.D.C. has applied for £10,000 loan for an electricity scheme and has instructed the surveyor to press on for an additional 12 houses to be erected on the Pengam and Blackwood sites.

BILSBORROW.—The late Miss Salesbury, of Myerscough Hall, has bequeathed £20,000 for building and endowing a new church and the formation of a new parish. A local committee has been formed to meet a Bishop's Committee at the Parish Church Vestry, Preston, to recommend that the bequest be gratefully accepted.

BINGLEY.—Plans passed by the U.D.C.: Extension of garage at Crow Nest, for Mr. J. B. Lister; three temporary garages, Priesthorpe-lane, for Mr. J. B. Lister; garage at Harecrofts, for Mr. E. Firth; garage, Birchen Lea Farm, Wilsden, for Messrs. H. Drake & Son; butcher's wooden shop, Main-street, Bingley, for Mr. F. W. Mountain; house and shop, Keighley-road, Crossflats, for Mr. C. Noble; bungalow, Beckfoot-lane, for Mr. James Earnshaw; dwelling-house, Park-avenue, Bingley, for Mr. F. Johnson; amended plan for two villas, Park-road, Bingley, for Messrs. D. Wildman & Son; pair of semi-detached villas, Slenington-road, Crossflats, for Mr. F. Weatherhead; conversion of house into offices, and additions, in Bradley-street, Bingley, for Messrs. J. H. Beaver, Ltd.; garage and shed, Lime-street, Bingley, for Messrs. Wilkinson & Whitley, Ltd.; garage and shop, Fernbank-drive, for Mr. I. Dawson.

BIRKENHEAD.—Plans approved by the T.C.: Amended plan for the erection of a music and dancing hall above the garage and showroom in Park-road, north, opposite the Birkenhead Park entrance; erection of dwelling-house, north side of Ashburton-road; erection of garage, 12, Beech-road; addition in the rear of 45, Devonshire-road; addition at side of 15, Rock-park; erection of five houses, west side of Palmgrove; erection of temporary building to be used as an aviary in rear of 16, Keightley-street; erection of temporary building to be used as a smithy, adjoining the Albert Memorial Schools; erection of temporary building to be used as a dwelling-house on Small Holding No. 1b; erection of temporary cycle shed, No. 71, Cavendish-drive; erection of lock-up garages, 56, Whetstone-lane; erection of tennis pavilion, Egerton-park; erection of lecture hall, north side of Whetstone-lane, in connection with Beechcroft Settlement.—The lay-out plan for the town's war memorial has been approved on a site opposite the Town Hall.

BIRSTALL.—Plans passed:—Motor garage at Belle Vue House, Nab-lane, for Mr. J. Akeroyd.

BLACKPOOL.—Plans passed by the T.C.: D. D. Hough, two houses, Bournemouth-road; Whiteside & Threlfall, two houses, Layton-lane; Hargreaves & Emery, 12 houses, Squire's-gate-lane; T. Brierley two houses, Bispham-road; R. Leach, two houses, Boscombe-road; G. Slater, 14 houses, Bispham-road; T. Hill, two houses, St. Anne's-road; R. Brotherton & Sons, two houses, Central-drive; C. Barkham, bungalow, Pedder's-lane; W. J. Rushworth, four houses, Westmorland-avenue; Miss Nicholl, bungalow, Central-drive; P. Rounds, four houses, Liverpool-road; J. England & Sons, two houses, Bank-avenue, Bispham; J. W. Docking, bungalow, Bispham-road; G. Francis, six houses, Bournemouth-road; Ormerod & Ogden, five houses, Romney-avenue; Suthers, Wilson & Randall, bungalow, Osbourne-road; Suthers, Wilson & Randall, bungalow, Balmoral-road; J. & J. Senior, two houses, King Edward-avenue; H. T. Martin, house, South-avenue; J. A. Hayhurst, house, Boscombe-road; Wright & Fitton, two houses, Birchall-avenue; R. Taylor, two houses, Frederick-street; J. Taylor, four houses, Leamington-road; H. Riley, four houses, Central-drive; Dickinson & Sainter, two houses, Gosport-road; C. W. Norris, 22 houses, Ord-avenue; Barlow & Midgley, two bungalows, Abbeyville; J. Hodgkinson, three houses, Durley-road; J. C. Jenning, bungalow, Bispham-road; Miss Armitage, house, Kingston-avenue; W. Marsden, three houses, Warley and Lichfield-roads; Parker & Allen, four houses, Salisbury-avenue; W. Briggs, two houses, Highfield-road; E. Mazurk, five houses, Fir-grove; M. Dickinson, two houses, Whitegate-drive; A. J. Lomax, house, Fleetwood-road; Parker & Allen, house, Keswick-road; J. Foster, two houses, Boscombe-road; S. Thomas, two houses, Newton-drive; J. Foster, three houses, Abbey-road; A. Hindle, house, Argyll-road.——Plans for 100 houses to be erected off Devonshire-road, North Shore, for the B.C., have been approved and tenders are to be obtained.

BOLTON.—Plans approved by T.C.: Mr. Brownlow, bay window, 640, Tonge Moor-road; J. H. Clayton, attic, 31, Devonshire-road; W. H. Pilling & Sons, petrol pump and tank, Maple-street; H. Whitehurst & Sons, petrol pump and tank, Crown-street; Francis H. Buckle, bungalow, Withins-lane; William Ingham, scullery, 167, Settle-street; John Stewart, wooden garage, off Bayley-street; George Mercer, extension to premises, 81, Radcliffe-road; T. R. Bridson & Sons, Ltd., cart shed, Bolton bleachworks; Rawsthorne & Co., wooden garage, Lark-street; Cooper & Cooper, additions to offices, 10–12, Bowkers-row; G. M. & T. D. Tyson, amended plan, outbuildings, 36–38, Green-lane; John Davies, wooden motor shed, Punch-street; Stewarts Clothiers, Ltd., alterations, &c., 80, Deansgate; George Proffitt, additions, &c., 9, Burlington-street; Bolton Church Institute, cloak rooms, &c., Institute-street; London Joint City and Midland Bank, alterations, &c., 232, Chorley Old-road; A. Douglas, house, Sherbourne-road; John Archer, four houses, off Colenso-road; Norman S. Kemp, amended plan for addition to house, 252, St. Helens-road; W. W. Pickup, four houses, Constance-road; Thos. Cross & Co., Ltd., canteen and pavilion, Avenue-street; Thos. Collinson & Son, Ltd., alterations, &c., Knowsley-street; William Hall, wooden motor shed, John-street. Plans approved conditionally: E. Roocroft, wooden garage, 112, Lonsdale-road; Walter Taylor, wooden store shed, 60, Albert-road west; J. Urmston, portable wooden shed, 416, Bury-road; H. Seymour, extension to wooden shed, 42, Bradford-street; Mr. Morton, wood and glass shed, 26, St. Augustine-street; E. Claydon, wooden sheds, 641, St. Helens-road; F. Wilcocks, wood and glass shed, 24, Church-avenue; T. H. Boothman, wood and glass shed, 18, Silverdale-road; Thos. A. Shippobottom, wood and glass shed, 28, Church-avenue. Plans of the following houses to be subsidised have been approved: Mr. John Archer, eight houses; Mr. Joseph Uttley, 16 houses; Messrs. E. & S. Street, two houses; Mr. A. S. Woods, two houses; Messrs. Horrocks & Andrews, three houses Mr. T. H. Cartwright, 24 houses.

BOURNE.—The R.D.C. has received a letter from the Ministry of Health offering no objection to the proposal of the Council to build cottages under the Housing Scheme at Corby, Market Deeping, Deeping St. James, and Rippingale; and, subject to satisfactory tenders being received, they are prepared to recognise the houses as eligible for financial assistance under the Act.

BRADFORD.—The lay-out plans of 380 houses at Heights-lane, which are to be erected by private enterprise, have been approved. Owing to the contemplated improvement at the junction of Manchester-road and Horton-lane, a site is now being sought by the Leeds Permanent Benefit Building Society, whereon to erect new premises along Horton-lane. Messrs. A. & F. Mosleys, Wormald-row, Leeds, are the architects.

BRAINTREE.—Towards the total cost of £39,608 for resurfacing a number of roads, the R.D.C. has received a grant of £29,706.

BREDBURY.—The Hyde and District Co-operative Laundries' Association, of Russell-street, Hyde, have purchased a large building and land adjoining formerly in the occupation of Messrs. Henry Simons, Ltd. The building is 214 ft. long by 45 ft. wide and there is a corrugated iron garage 51 ft. by 25 ft. It will be necessary before they enter into occupation to build a chimney, boiler house, engine house and mechanics' shop, and install a dry-cleaning process. The association propose to transfer their whole business at Hyde later, and dispose of these premises, which, it has been suggested, would be very suitable for a cinema.

BRIDLINGTON.—A number of improvements on the sea front at Bridlington are in contemplation. It has been proposed to build two sea walls along the south side of the Spa and on the north side of the town. At present the sea wall roadway in front of Sands Cottage Estate is being widened as a government-assisted unemployment scheme, to a width of 80 ft. When a new sea wall is erected in front of it, the roadway will be widened to 100 ft. The improvements are to cost between £150,000 and £180,000.

BRIGHTON.—The T.C. has received a report from Professor Adshead embodying suggestions regarding the Aquarium site, in which he advocates a scheme

* See also our List of Contracts, Competitions, etc.

which will link up other features in the environment —the covered promenade on the Madeira-drive, and the widening of the road round the property must form part of the plan. He proposes a concert hall to hold 1,500 people, in semi-circular form, with a wide promenade, the orchestra being placed in an alcove. On the promenade section, refreshments would be provided. At the western end of the site, the scheme provides for a sea water swimming bath, offices and a terrace garden. The scheme, which could be carried out in sections, is being considered by a Special Committee of the Corporation.

BUILTH WELLS.—The Council is to consider reconcreting, at estimated cost £2,000, of bottom of Ty Capel Reservoir, which is reported to badly require such work.

BURNHAM (ESSEX).—Plans passed by the U.D.C.: Bungalow, in Ship-road, for Mr. F. J. Handley; pair of cottages in Princes-road, for Mr. E. Read, jun., and alterations to house in Mill-road, for Mr. Slaughter.

BURNLEY.—Plans passed by T.C.: Shop front at No. 1, Doris-street, Mr. Croston; water tower at Calder Vale Mill, The Calder Vale Room & Power Co., Ltd.; house at Pasture Gate, Mr. T. H. Grey; alterations at Fulledge Conservative Club, Plumbe-street, Messrs. Vowles & Johnson; two houses in Moseley Hill-road, Mr. J. Nuttall; additions to "The Grange," Marsden-road, Mr. J. Stuttard; office in Colne-road, The Burnley Building Society, Ltd.; doorway at garage in Queen-street, Messrs. Lupton & Place; alterations at 418 and 420, Colne-road, Mrs. Fennell; shop front at 138, Padiham-road, Mr. J. O. Smith; washhouse at 14, Carlton-road, Mrs. Dawson; shop front at 130, Abel-street, Messrs. W & M. Rooke; two houses in Queen's-road, Messrs. Butson, Clegg & Holdsworth; shop front at 165 and 167, Padiham-road, Mr. James Binney; additions to Victoria Hospital; eight houses in Marsden-road, Mr. W. Taylor; branch library in Colne-road, the Public Library Committee. Subsidies approved for the following: Butson, Clegg & Holdsworth, two houses in Queen's-road; Mr. W. Taylor, eight houses in Marsden-road; Mr. F. Thornton, six houses in Marsden-road.——The Electricity Committee have decided to approach Accrington Corporation concerning an electricity main between Accrington and Burnley, which will enable either authority to supply the other in case of need. There is also a scheme for the laying of an electricity main in the Rosegrove district. These schemes will probably involve an expenditure of about £60,000.— —Mr. C. Thornber has left £5,000 to the Victoria Hospital, for the erection of a new operating theatre.

CARLISLE.—Plans approved by the Health Committee: Bungalow, Burgh-road, for Mr. J. Ainsworth; rebuilding premises, 23, Botchergate, for Messrs. Fisher & Sons; two houses, Bedford-row, for Messrs. Lovett & Nichol; business premises, Scotch-street, for Mr. W. Smith; factory additions, Lorne-crescent, for Messrs. Morton's London Fabrics, Ltd.; bungalow, Goodman-terrace, for Mr. J. P. Tanner; three houses, Upperby-road, for Mr. E. Musgrave; garage, Duke-street, for County Garage Co., Ltd.; alterations, Botchergate premises, for Messrs. Harrison & Son.

CARSHALTON.—The local Council has decided to erect a pavilion on the Stafford-road Recreation Ground, at a cost of £700.

NEW BUILDINGS IN SCOTLAND.

Dundee.—Houses.—The Scottish Board of alth has approved of contracts for the con-ction of 88 flatted houses to be erected by ndee Corporation on Dudhope Estate. The tracts amounted to £34,698 6s. 1d. in all. Convener expects that the schedules for 72 cottage dwellings will be issued in nt three weeks, and after that there were houses at Gardiner-street under the slum rance scheme.

irling.—Baths.—The T.C. is proceeding the erection of the public baths, estimated £10,400.

'ness.—Factory.—Plans have been ap-ed for a hosiery factory at Dean-road, for Seaforth Hosiery Co., Ltd.

vah.—Public Hall.—Efforts are being to raise funds for the erection of a public-or the parish of Alvah, in Banffshire.

enock.—Slaughterhouse.—The Corpora-re going to submit to the Government a e for a new slaughterhouse, estimated to £36,000.

sgow.—Bandstands.—The Corporation dopted a scheme for the improvement of andstands and enclosures at the Kelvin-Park, at a probable cost of £3,000.

rn.—Manse.—£1,800 has been raised ds providing a new manse and organ for airn United Free Church.

rdeen.—Dwellings.—The Corporation Committee has passed the plans for a low in Queen's-road to cost £1,100, and a on the east side of Anderson-drive, to 1,500, and a house in Queen's-road, for A. L. Mackinnon. Plans for a number of uildings, including a church, halls, and house at Regent-quay and Water-lane, en submitted to the Corporation.

NEW COMPANIES.

The particulars quoted below have been compiled by Messrs. Jordan & Sons, Ltd., Company Registration Agents, of 116 & 117, Chancery-lane, W.C. 2, from the documents available at the Companies' Regi try.

Beswick's Lime Works, Ltd. (191,854). Registered August 13. Brierlow, Hindlow, near Buxton, Derby. Limestone quarry proprietors, now carried on by Percy James Beswick at Hindlow and Brierlow, Derby, under the style of Beswick's Lime Works. Nominal capital, £25,000.

Browne & Woolley, Ltd. (191,771). Registered August 7. 36, Brooke-street, Holborn, E.C. 1. Builders, contractors, land and estate developers. Nominal capital, £100.

James Nuttall & Son, Ltd. (191,807). Registered August 8. 30, Colldale-terrace, Haslingden, Lancaster. Builders and contractors, plasterers, &c. Nominal capital, £1,000.

Geo. Andrews & Co. (Builders and Decorators), Ltd. (191,776). 137, Inverness-terrace, W. 2. Registered August 7. Builders, decorators, public works and general contractors, &c. Nominal capital, £2,000.

W. B. Cooper & Sons, Ltd. (191,768). Registered August 4. Sans-street, south, Sunderland. Builders and contractors, &c. Nominal capital, £2,000.

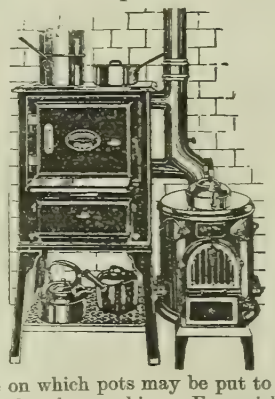
Invicta Building Co., Ltd. (191,960). Registered August 17. The Paddock, Chatham, Kent. To purchase, build, erect and sell private dwelling houses or tenements, shops, buildings and premises of every description. Nominal capital, £600.

George Kemp, Stroud & Co., Ltd. (191,909). Registered August 15. To acquire and take over as a going concern the business now carried on by George Kemp at Elms-road, Aldershot, as a building contractor under the style of George Kemp & Co. Nominal capital, £8,000.

William Pinchin & Co., Ltd. (191,927). Registered August 15. 2, Hague-street, E. 2. Colour, paint and varnish manufacturers and white lead merchants, hitherto carried on by the trustees of the late Mrs. A. B. Pinchin (deceased), under the name of William Pinchin & Co., at Hague-street, and 8, Church-street, both in the County of London. Nominal capital, £6,000.

Workmen's Dwellings on Easy Terms.

As he is of the opinion that some of his workmen may desire to own their own houses, Lord Londonderry is giving effect to a building scheme at his Durham collieries. He has arranged to build houses, of which he will sell one house only to any one official or workman in his employ who wishes to purchase. The purchaser pays a deposit of £5 on account of the price, and will get the benefit of the Government subsidy, which is calculated at about £75 per house. The cost of the house, less the deposit, and after giving credit for the Government subsidy, will be payable by weekly instalments of 10s., which will pay for both principal and interest in a period of fourteen years, the principal bearing interest at 3 per cent. per annum. The purchaser may anticipate the weekly instalments if he wishes to expedite his complete ownership of the house.



The houses will probably be of the three-roomed type, with scullery and bathroom, and it is estimated that they will cost about £300 each, after deducting the subsidy. The purchaser will be entitled to the possession of the house on its completion, and the balance unpaid will remain on mortgage at 3 per cent., the money being advanced by Lord Londonderry.

Most of the men who are expected to become purchasers of these houses are miners receiving a rent allowance of 5s. per week, and they will thus be able to buy them for an additional 5s. per week. As an experiment, Lord Londonderry offers to build twenty houses at Dawdon and twenty at Seaham, and it is understood that he will extend the scheme if the demand arises.

TRADE NEWS.

That the firm of Grey & Marten, Ltd., of City Lead Works, Southwark Bridge, S.E. 1, founded in 1833, is not only keeping abreast of the times but leading in many respects, is shown by their latest catalogue. This substantial and well-produced volume, of 250 pages, covers every description of builders' ironmongery, sanitary goods, and fittings, and reference is made easy by a very comprehensive index. Each item listed is illustrated and priced, and although the prices are subject to alteration owing to market fluctuations, this is a valuable feature which is not found in many catalogues nowadays. Some attractive mantel registers and well-designed lavatory basins are particularly noticeable. A large range of sheet lead and lead pipe is priced at low figures, as is perhaps to be expected from the first firm to manufacture lead pipe by the hydraulic press.

The new "Sentry" oven, which we illustrate is provided with an oven 16 in. wide, 15½ in. deep, and 12 in. high, below which is a hot chest measuring 21½ in. wide, 15½ in. deep, and 6 in. high, for heating plates or for baking at low temperatures. On top of the oven is a large

hot plate on which pots may be put to simmer or for similar slow cooking. For quick boiling the hot plate on the "Sentry" boiler itself is available, and the cooking facilities on the boiler hot plate are in no wise impaired by employing an oven. The whole apparatus forms a very compact unit which will do all the cooking and supply all the hot water to baths, sinks, hot taps, towel rail, &c. An attractive leaflet describing the oven is issued by Wood Russell & Co., of 34–36, Oxford-street, London, W., the manufacturers.

Messrs. Charles Churchill & Co., Ltd., of 9-15, Leonard-street, Finsbury, have issued an attractive booklet illustrating their "Alundum" safety products, which are in use in some of the leading buildings in the country. The walking surfaces of stairs, corridors and subways, stations, trains and 'buses, lift landings, &c., are rendered safe and durable by these products.

Owing to the expiration of Messrs. Francis Polden & Co., Ltd.'s lease, at 17, Wells-street, W., more extensive premises adjoining the company's head offices, 55, Cannon-street, London, E.C., have been obtained, and a showroom for the display of electrical fittings, domestic appliances, and accessories, has been opened. (The telephone number is City 5538–9.) From time to time the company are arranging for special demonstrations to be given to show the advantages of a particular piece of electrical apparatus, and a technical staff is always available to explain any appliance displayed.

To meet the increasing demand for their manufactures, Fuller's United Electric Works, Ltd., of Chadwell Heath, Essex, have opened a London depot at 58, High-street, W.C.2 (close to Tottenham Court-road Tube Station).

At the Shipping, Engineering and Machinery Exhibition, Olympia, Nobel Industries, Ltd., have a comprehensive display of their numerous products, which are of great interest to those engaged in mining, blasting work, civil engineering, road-making, railways, &c.

THE BUILDER

A JOURNAL FOR THE ARCHITECT AND CONSTRUCTOR.

WITH WHICH IS INCORPORATED "THE BRITISH ARCHITECT."

VOL. CXXV.—No. 4206. SEPTEMBER 14, 1923

LABOUR IN THE BUILDING INDUSTRY.

RECENTLY there has been a slight revival in building, and the immediate consequence has been a shortage in skilled labour. This revival cannot by any stretch of imagination be called a boom; it is merely an increase in activity cessation of the slump. That such a comparatively small ount of work should create difficulty in obtaining labour most serious matter, and it is necessary that those who e the welfare of the industry at heart and are dependent n it for their livelihood should immediately take stock of situation.

Mr. F. J. Gayer, whose foresight in these matters is well wn, draws public attention to the fact in a letter which we lish this week (see p. 418), and makes some piquant remarks n the subject. In a short letter it is only possible to touch fly upon one or two salient points in a complicated situation, very little more can be done in a short article: the matter f vital importance and requires exhaustive consideration, a few facts and tendencies may be noted. In the first ce, it is necessary to probe the reason for the shortage, and sk three questions:—

1. Are there actually fewer skilled men in building than ore the war?
2. Is there a greater amount of work?
3. Are the conditions of work in the industry different?

To this may be added a fourth question:—

4. Is there a shortage of unskilled labour?

The last point may be answered first, because the reply is ond doubt. There is an ample and apparently unlimited ply of labourers, and no shortage appears to be in the least pable. To see young men of this generation entirely killed and with apparently no ambition to improve is ething in the nature of a tragedy, especially when we se that many of them are condemned to work for thirty orty years at their present tasks without showing any ress or improvement. It must be reluctantly admitted this is one of the blots on trade unionism. It is criminal rbid these men to rise, especially if they have the necessary tive and skill, and that in effect is what happens. It is that, by a roundabout method, a labourer may eventually lassed as a craftsman if he can gain the necessary know- and skill, but this is in spite of, and not because of, the iling system of recruiting skilled labour.

he question as to whether there are actually fewer skilled in building than before the war is difficult to answer, but tigations are in hand to obtain this information. It may finitely stated that at present, at any rate, the volume ork available is less than that in progress in 1914, and this is not a cause of the shortage. The question, "Are tions of work in the industry changing?" is less easy to r. In many ways they are. For instance, the cost of ng has necessitated the keenest possible scrutiny of ways eans of saving money, and one of these means has been duction of the time spent on erecting a building. By this overhead charges and supervision are reduced, hire of is reduced, and interest on capital sunk but not available for trade is lessened. For all these and other reasons, most buildings must now be built and brought into use in the shortest possible space of time. The result of speeding up erection is two-fold:—

1. (*a*) Work becomes more precarious, but more men are required for short periods; (*b*) alternatively, men can earn higher wages for a limited period if they are allowed to work overtime. This would provide the thrifty ones with the necessary money to tide over periods of unemployment.

2. It has tended to eliminate the apprentice because the foreman will not be worried by any possible clog upon the speed of his job.

These matters are all strongly emphasised by a short working week.

The result of the investigation so far shows that conditions have undoubtedly become more difficult, but that there has been no corresponding change in current customs and methods to counterbalance them. It will be found, however, that the fluctuations in building work are even more marked than is indicated by causes already enumerated, and one of the important factors increasing the fluctuation of employment in particular firms is the advent of the large building. Large buildings mean a large amount of employment for a particular firm for periods of six months, one, two, three, or more years. At the end of such a contract the particular firm in question may or may not immediately replace this work by a similar contract, and if they do not two events take place:—

1. Their men must find other employment in the same town or district with another contractor.

2. The proportion of apprentices employed by that firm (assuming there are any) becomes altogether disproportionate, with corresponding difficulty in arranging labour and teaching the youngsters their trade.

Formerly the flow of work in firms of standing was much more steady. Large contracts were spread over a number of years with the possibility of adjusting labour and of taking and training a given number of apprentices. These conditions have disappeared completely for the present, and, as far as can be seen, seem unlikely to return. During the war there was a serious stoppage of building work, a stoppage that was more complete than the interruption experienced in any other industry. Before the war, weather, unemployment, and other factors tended to keep men out of the industry; and since the war absence of attractive conditions of labour has still further depleted numbers. The whole country is likely to suffer in consequence because building is vital to progress.

It is impossible to say whether the solution to the problem will be found in elastic working hours and arrangements to work overtime for limited periods or during a boom; whether it will be found in some system of payment by results, with its consequent reward to the industrious and highly skilled mechanic; or whether it will be found in the training of apprentices, improvers or labourers. Whatever the solution, it is necessary that the leaders of the industry should endeavour to find a way out, and until a commencement is made real progress in the country is impossible.

NOTES.

Ancient Buildings Preservation.

IN a very interesting letter to *The Builder* last week Mr. Powys deals with the various points of view which may be considered in relation to ancient buildings, and he ably illustrates the attitude of the Society for the Preservation of Ancient Buildings. Such letters as this help to clear the air and show where the varying points of view lead. It is quite clear that the different values of history, architecture, sentiment, or archæology cannot appeal to all alike, and that a balance of judgment between all the varying values is likely to be somewhat rare in the individual. In the case of old churches there may be complication of other things, such as need for economy, continuity of worship, &c. Who is to deal fairly with all this?

Photography and Art.

PHOTOGRAPHY has added greatly to the interest of our modern life; it has been of immense practical and economic value, and even in an artistic sense has been the vehicle of much value in the hands of artists. At the same time, its widespread use as a means of illustration has impoverished us to a very serious extent. We have never, perhaps, had abler artists at our command for the suggestion of the beauties which lie around us, and yet we look in vain for the regular succession of beautiful and sympathetic suggestions of the beauties of nature and art, which could so readily be given to us.

Royal College of Art.

THERE is some inaccuracy in stating, as reported of Sir M. Barlow in his address to the students of the R.C.A., that the great painters, sculptors and architects "showed the way," and the great works themselves were achieved by the "common people." It is quite the opposite of the true conception of greatness, which is to impose the heaviest labours on itself. To take the case of art, how far the great works of Turner, Reynolds and Alfred Stevens were achieved for them we are at a loss to discover. It is true that some painters and sculptors have had assistance, or "ghosts," but we are not aware of this being regarded as proof of their greatness; and the exact contrary is witnessed, too, in such masters as Michelangelo or Leonardo da Vinci. But even in the case of the architect, where the share taken by the community in their work is larger, this remote greatness, like the "Almighty watching it go," is far from the fact, though architecture suffers enormously at the present time because the architect is not nearer to his work. Sir M. Barlow was on surer ground when stating that "they wanted to improve the conception of the craftsman in art, and, indeed, the conception of the craftsman's life generally."

Liverpool School of Architecture.

THE prospectus of the School of Architecture, Liverpool University, 1923–24, is before us. It may be remembered that the school was founded in 1894, and offers courses designed to provide a full professional education at a University standard for all who intend to practise as architects and who wish to acquire their training in an atmosphere of liberal studies alongside students of other professions. The studies lead to a degree of Bachelor of Architecture or a Diploma in Architecture. The School was the first to formulate and to present Degree and Diploma courses of a full professional kind to the Board of Architectural Education of the Royal Institute of British Architects, and was the first o the six schools now recognised by th Institute to secure for its graduate exemption from all subjects but one o the Institute's Final Examination. Som excellent illustrations of students' wor give added interest to a well-produce prospectus.

Knossos Frescoes.

THE account of the frescoe discovered at Knossos b Sir Arthur Evans, of whic particulars are given in *Th Times*, is full of interest. These pain ings were found heaped together i a room, having been taken down fo removal at some time, in the hous of a Minoan burgher, and are repr sentative of the golden age of Minoa Crete. Though primitive in characte by the side of such paintings as have bee recently discovered in Eton College chape and dating back to 1600 B.C., they hav their own vivid identity and fulness life. The success of any art at any perio may be said to be in the power to reali its ideas and interpret them in forms beauty, and in the accompanying freedo to do so. In this sense these very ancie wall decorations are as fully represent tive as any others. The technical rang of their expression and realisation is n so wide, but we feel the influence nature and beauty, and the fulness life which they portray. We are, perhap suffering now from the burden of our ow knowledge, knowing so exactly how to d these things, aided by such ample techn cal resource yet lacking the impulse f what is worth doing, as one feels much with our war memorials. We see to lack the liberty to express anythi very vital, or is it that we have so litt to express? Like all art at its be wall painting and ornament general seem to flow out of civilisations—clas

an Etching by MR. PERCY J. WESTWOOD, A.R.I.B.A.

diæval—almost unconsciously, little ened by the preponderance of theo- knowledge and prepossession which s down our own. Is it better to more to nature and endowment to foster it so much? The famili- with nature and the character of escoes, as described by Sir Arthur s, fill the mind with gracious im- ons, liberating it to enjoyment. Modern organisation would appear to set a barrier against nature and sensibility, understanding only what is like itself. It is in this sense that these frescoes are so important as representing that rich overflowing freedom to expression which is lacking in our own art because it is lacking in life.

Eton College Wall Paintings.

THE mural paintings recently uncovered at Eton College are of very considerable artistic importance, being exceedingly well realised and graceful compositions, having as their subject "Miracles of the Virgin." Done straight on to the walls, over a thin undercoat of plaster, they are said to have occupied the ten years, from 1479 to 1488, and were rediscovered after a century and a half of oblivion. Though the name of one of the artists responsible for these mural pictures has been handed down as William Baker, they bear an unmistakably Flemish origin, and we know that Flemish painters were working over here at about that time. The figures painted in niches, and which divide the larger paintings, are both dignified and expressive of noble character; while the subjects themselves are finely designed and well realised. Some have suffered more than others, but what remains is, perhaps, the most complete example of ancient wall painting in the country, though it cannot, we think, be credited to English artists. These examples show us with what directness and confidence these mediæval painters approached their work. They were not much concerned by the joints of the masonry underneath, nor too precise in the way they looked at it. In the photographs of these paintings, so well reproduced in the *Times*, the joints of the masonry are to be discerned coming through the paintings, which were divided from them only by this thin coat, probably quite the best way possible for such work, in spite of the toll that time has taken of it. We do not hear in what material they are painted, but should expect it to have been tempera, perhaps the most beautiful and resourceful medium for the purpose. We may learn from such work that the simpler and more direct ways are better than indirect ones, for their freedom from so many prepossessions as to method and approach.

Old Masters Again.

IF the present season does not reveal its usual sea serpent, its place would appear to have been taken with the discovery of "old masters," quite a crop of which have emerged but lately. In addition to Mrs. Hahn's "La Belle Ferronnière," which will appear, so we are told, next week in the Louvre, alongside of Leonardo's picture of the same name, we have a new Rubens at the National Gallery, and the "Glenconner" Reynolds' pictures which have just been acquired by Messrs. Duveen Brothers; while over and above these we have now the discovery in Vienna of a number of pictures "which prove to be genuine Rubens and Van Dycks." These last were badly overpainted and were believed to be cheap copies, but now, so we are told, "the coating has been removed and the original pictures are revealed." From reproductions appearing in a contemporary, we do not think much of two of them, *i.e.*, the two Rubens illustrated. They have the usual characteristics which pall from familiarity, and are quite like "old masters." It must always be remembered that "dealing" in old masters has little or nothing to do with love of art, and is concerned only with commercial interests. A little plain speaking about "old masters" is not, therefore, out of place. Rubens painted some good pictures and a far greater number of very bad ones; it is not the name but the thing that matters. Evidence of progress in national taste will be recorded more through the slump in "old masters;" which it will entail, than in the present demand for them. When our values are truer we shall no longer be able to conjure with names, and at the time of buying and selling, to quote the Eastern proverb, "glass will be glass and jewels, jewels."

Avignon, from Villeneuve From an Etching by MR. PERCY J. WESTWOOD, A.R.I.B.A.

GENERAL NEWS.

Professional Announcement.

The offices of Professor Beresford Pite, F.R.I.B.A., have been changed from the Royal College of Art, South Kensington, to 101, Great Russell-street, W.C. 1, and his telephone number is Museum 2481.

New Radnorshire Magistrate.

Mr. Thomas Lant, a well-known Radnorshire quarry proprietor, of Llanybed, near Builth Wells, has been appointed a magistrate for the county. Mr. Lant has a residence at Roath, Cardiff.

Appointment.

The Horwich D.C. has appointed Mr. W. J. H. Wood, Borough Electrical Engineer of Bolton, to be their consulting engineer for two years in connection with their agreement with the Lancashire Electric Power Co. to supply electricity to the district, and to supervise the carrying out of the scheme.

Architects' Estates.

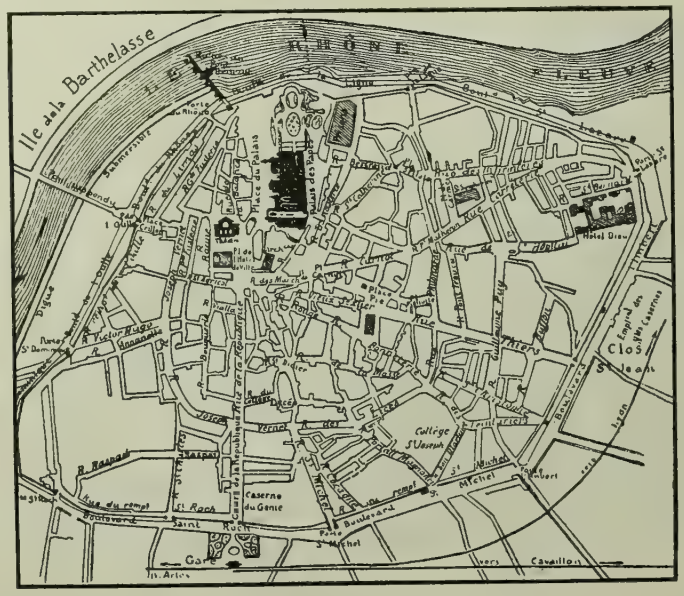
Mr. Augustus William Tanner, A.R.I.B.A., of Erpingham-road, Putney, S.W., left £7,192 (net personalty, £7,108).

Sir James Lemon, J.P., M.I.C.E., F.R.I.B.A., F.S.I., of Stockwell Lodge, The Avenue, Southampton, retired civil engineer, past president and hon. treasurer of the Institution of Municipal and County Engineers, Alderman and twice Mayor of Southampton, who died on May 9, aged 90 years, left £13,125 19s. 1d., with net personalty, £8,476 11s. 4d.

R.I.B.A. Problems in Design.

Attention is drawn to the fact that, owing to a printer's error, the requirements for the drawings as set forth in (*b*) Working drawings of design subject No. LXIX (a school library), are incorrect. The requirements should read as follows: "The design for a school library may, after it has been approved, be re-submitted with the addition of one ½ in. scale elevation and two ½ in. scale sections finished as working drawings. The section to show the book-case fittings."

Rebuilding of Japan's Cities.



Official representatives of Japan in this country, Japanese business men and Americans in close touch with Japan's commercial affairs, believe (wires the *Morning Post* Washington correspondent) the effect of the great tragedy will be practically the rebuilding of all large cities in the island kingdom. The latest most reliable reports from Tokio show that modern buildings of steel and concrete stood the shock of the earthquake and resisted fire, while buildings of native construction were quickly destroyed. If these earlier reports are confirmed, it is the belief of men familiar with the Japanese temperament that in the rebuilding of the ruined cities the Japanese, with their quickness to seize upon the latest in discovery and invention, will make the new Tokio a city of steel and concrete, which may rob it of some of its former picturesque charm, but will be a protection against future disaster.

Housing Loans.

In a circular just issued the Minister of Health states:—By the Ministry of Health (Rate of Interest) Amendment Order, 1923, dated August 14, 1923, the Minister has now fixed 5 per cent. as the rate of interest at which local authorities after the date of the order may make advances under the Small Dwellings Acquisition Acts. This order supersedes the order of December 5, 1922 (in so far as that order related to the Small Dwellings Acquisition Act). The Minister will be prepared to give consideration to an application for fixing a higher rate than 5 per cent. in respect of any authority who are of opinion that having regard to terms at which they can raise loans or for other reasons the above rate is not sufficient to cover the expenses likely to be incurred in respect of advances made by them under the Acts.

Garden City for Glasgow.

The Housing Committee of Glasgow Corporation had before them last week a report by the Director of Housing as to negotiations with the factor for Elderslie estate for the acquisition of 195 acres of ground at Bankhead, adjacent to the ground at Knightswood, already owned by the Corporation. It was decided to recommend the purchase of the ground with a view to carrying out a garden city scheme, with a park and recreation ground. The complete scheme outlined by the Housing Director provides for a public park of 175 acres, surrounded by avenues of houses. The total number of houses would be over 2,000, and these, added to the 1,100 proposed to be erected at Knightswood, would make the complete scheme about twice the size of Mosspark, at present the biggest of the Corporation's housing concerns. A lay-out plan was also agreed to for Sandyhills, Shettleston, where about 240 houses are to be erected on the purchase system, prospective owners paying £50 down and the balance in instalments, spread over twenty years. It was further agreed to recommend a scheme for about 220 houses at Bellahouston.

COMPETITION NE

Dudley.

FOR THE TOWN COUNCIL.—Designs f memorial building and tower. Premi £300, £200, and £100. Sending-in day, Jar 5, 1924. (See advertisement this week.)

Southsea Common Lay-out Competitic

FOR THE B.C.—Conditions and particul premiums will be forwarded on applicati the Town Clerk. Sending-in date, October Banned by R.I.B.A.

Other Competitions.

Other competitions still open includ following (the dates given are, first the sen in date, and second the issue of *The Buil* which full particulars were given):—Sing College (Jan. 1, 1924; March 30). Hul Gallery (Nov. 5; May 4). Mint compe for plaques (Sept. 30; May 25). (scheme (Sept. 30; June 29). Memorials Missing (Jan. 1, 1924; Aug. 3). Halifax out—*Banned by R.I.B.A.* (Oct. 1). Sw Masonic Hall (Oct. 3). Eastleigh and B stoke Assembly Hall (Aug. 24). House, Manchester (Oct. 15; Sept Chiswick Embankment—*Banned by R.* (Oct. 15; Sept. 7). Coatbridge War Me Aug. 31).

RMSTRONG COLLEGE BRARY COMPETITION.

E Council of Armstrong College, by their y of instituting a competition for their library, have adopted a precedent that t well be followed by other universities. irable conditions were drawn up and de- l information supplied of fittings, &c., so all competitors were placed on an equal ng. Briefly, the conditions asked for a reading room and stack room, six small nistrative rooms and entrance. The site ntiguous to existing buildings, with a frontage of 118 ft.

viewing the designs generally, the majority ding the winner) have placed the reading facing the main front, with the stack room d, which seems right and proper. The native of placing the two main rooms end the front offers possibilities, but it does ook architecturally correct. After placing ain rooms, finding a home for the etceteras here competitors failed or succeeded, ding to their interpretation of the assessor's cut conditions.

the first and second premiated designs, the rs have taken liberties with regard to the important minor room, viz.—cataloguing . The conditions clearly state that it is " adjacent to and overlooking the reading ." The importance of this is obvious, and, ally, it will be found that all the designs complied with this condition except those ioned above. The second design could r overcome this defect without alteration n, but the design to be executed could not. ask for special conditions for this room hen give the job to the competitor who not comply with it, and cannot, without ng his plans ? This condition could hardly d as of a " suggestive character." It must been definitely fixed for a purpose, and the rity of competitors have handicapped them- s with the other minor rooms by meeting nditions laid down.

e placing of the entrance hall has caused etitors some trouble, but disposing of this e centre of the reading room and walking the latter to the issue desk is, clearly, ionable. This seems to have been the over which the majority of competitors led. The fashionable symmetrical plan rs to have swayed their better judgment. rst premiated design (Mr. Dunbar Smith) entrance hall at one side, from which a r leads to the centre of the reading room. t very direct, but it does keep the traffic the reading room proper. The stack s at the back and also under the reading a basement. The photographic labora- nd the female staff room are placed in of the basement stack room. This ment leaves a good deal to be desired. in elevation is broad in treatment, and materials are carefully selected should y well. The bay windows look small on The roof lighting to the reading room adequate, but no doubt this will receive consideration.

second premiated design (Mr. W. G. has a plan with the two important end-on to the main front, with the hall and smaller rooms between. The rk reception space and corridor in the t do not look happy. The elevations and dignified, but the side looks more ng than the front.

third premiated design (Messrs. n & Weightman) has reading room and stack room behind, with card ng and issue desk between and The way into the issue desk in the oom from the entrance hall is not very ry, and the authors have been at some work out the minor rooms, which are one side. The stack room is in one ich is good, and the working arrange- good. The elevations are interesting, letail is very carefully studied.

. C. Bradshaw has submitted two In each case the plans are symmetrical with side entrances. One set is worked out on Tudor Gothic lines, and the other set is on ambitious lines, with a circular reading room and interesting elevations.

Messrs. Marshall & Tweedy have two schemes with pleasing elevations vigorously drawn. The saw-tooth roofs over the stack rooms give one a bit of a shock. Messrs. Cackett & Burns Dick submit a scheme which provides a good working arrangement. The entrance and access to the issue desk are well arranged. The clerestory lighting to the reading room would be very effective. The design by Mr. J. H. Morton and Mr. A. W. S. Cross is on Gothic lines. The plan does not seem happy, and too much stress appears to have been laid on the future stack room extension. The main elevation is drawn to the basement level and looks imposing. The ground line appears to be about 10 feet above basement level, which would rather destroy the effect.

Messrs. W. & T. R. Milburn provide a plan with pleasing elevations in the Early Renaissance manner. Mr. C. S. Errington divides his stack room into two blocks, which does not seem right. The elevation looks very satisfactory.

Mr. H. L. Honeyman has no less than three schemes. One set has a reading room 113 ft. long by 40 ft. wide by 19 ft. high, and another set has a main elevation which looks unsuitable for a library. Mr. H. T. Wright has two schemes with plans on similar lines. In one set the treatment of the reading room appears a little strained.

Messrs. Knowles, Oliver & Leeson place their reading room on the first floor with the stack room under. The main elevation would not look very satisfactory with the entrance door off the centre axis.

Messrs. Harrison, Ash & Blythe submit a very interesting design. The entrance to the reading room is not very good, and there is a rather dark basement corridor. The elevations are very good, though the fleche does not look happy in section. Messrs. Newcombe & Newcombe's design has rather jumpy elevations.

Messrs. Hicks & Charlewood's design has the main rooms end-on to the front with a roomy central entrance hall. The elevations are good, but the centre feature seems a little over-emphasised.

The designs on the whole attain a high standard, and the College authorities may congratulate themselves on having a good run for their money.

CORRESPONDENCE.

[While we are glad to publish letters on professional and other matters of interest to our readers, it must be understood that we do not necessarily endorse the remarks of correspondents, who will oblige us if they will express their views as briefly as possible.]

Architectural Competitions.

SIR,—In reading the correspondence evoked by Mr. Robertson's excellent article, I have been struck by the unanimity of opinion as to the failure of the "single assessor" system working happily and producing the best results. Thirty years ago a similar correspondence on the same lines was ventilated by the professional press, and it is to be hoped that thirty years hence the same abuse of the architect's confiding nature and love of unrequited labour will not again provoke apparently fruitless protest.

I am far from agreeing with one of your correspondents, who states that twenty-five years ago competitions were decided by influence. Whatever competitions may have been a quarter of a century ago, they have become progressively more galling in their conditions and less satisfactory in their awards in a large number of instances, and it is high time that the representative architectural societies took steps to protect architects not only against exploitation by promoters of competitions, but also against the architects themselves. For without a doubt if the method of assessing may be regarded as the culminating cruelty, the initial weakness rests with the unbusinesslike attitude of the architect who spends thought, time and money in producing a design knowing that the chances are anything from a hundred to one against his being successful, and handicapped at the outset by "conditions" that, generally, are more or less unintelligible and often contradictory.

The Bournemouth Pavilion Competition is a case in point, and has already been exposed by Mr. Robertson.

I also deny emphatically that architecture gains prestige from competitions. Very few laymen realise the amount of time and out-of-pocket expenses necessitated by the preparation of a set of competition drawings. The general opinion seems to be (if one successfully impresses upon an inquirer what is involved) that the architect is a man of wealth, is hard up for a job, or a lunatic. What other profession seeks to gain prestige in this way ?

Briefly, I consider the competitive system is to be condemned under the following headings : (1) Where the exact requirements are known a client should have no difficulty in selecting an architect. (2) The work demanded is excessive. (3) Conditions are badly framed. (4) Single assessorship.

Taking these seriatim, very glaring instances in the last few years have occurred under all of these headings. First, we have promoters holding competitions, obviously for their own advertisement, for a type of house or decoration which could have been arranged quite simply in a few interviews between a bona-fide client and an architect of average ability. Of the second objection, there is no reason (given competent assessors) why preliminary line plans and sketch elevations and sections to one-sixteenth of an inch could not adequately illustrate any design—as would be the case between architect and client. Should the assessors be unable to make a final selection three or four of the most original or best designs could be selected for a more detailed competition (approximately to what is now thought necessary), the competitors each receiving an honorarium sufficient to cover out-of-pocket expenses in making the drawings.

The remedy of the third objection is obvious. Lastly, we come to the assessor. So much has been written that I feel there is no excuse for more except as an amendment. Possibly my idea is full of faults, but I give it for what it is worth. I endorse the demand for three assessors, but consider that one of these should be nominated by the promoter of the competition, and two by the competitors themselves. This could be done quite simply (it seems to me) by sending with each set of conditions a list of (say) twelve architects of repute. Each competitor would vote for one of these gentlemen, and the two receiving the highest number of votes would, with the architect selected by the promoter, form the panel. In this connection I may add that I think it is absurd to expect professional gentlemen to give their valuable services without adequate remuneration, and that those who promote competitions should be prepared to shoulder some of the burden extra to what would be incurred by accepting the responsibility of selecting an architect and instructing him in the usual way.

London. G. L. W. BLOUNT.

Apprenticeship in the Building Industry.

A letter by Mr. F. J. Gayer on apprenticeship in the building industry is given on p. 418.

Obituary.

Mr. John Henry Kelly, who died recently at the age of 73, was for fifty years a prominent builder and contractor in Hull. He was for a long period on the board of the Hull Dispensary. He retired from business twenty years ago.

Mr. Richard Bellwood, a well-known builder, of Newcastle, died last week at his residence, in his 84th year. Deceased carried on a building business for about half a century, chiefly in house property in Arthur's Hill district, but retired some years ago. He had been a director of the St. Andrew's Permanent Building Society since 1867, and vice-chairman since 1902.

THE SOCIETY FOR THE PROTECTION OF ANCIENT BUILDINGS.

WE have received from "Isis" the following reply to the letter from Mr. A. R. Powys, Secretary of the Society for the Protection of Ancient Buildings, published in the *Builder* last week:—

Amidst the benison of these delicious autumn days I am little inclined for controversy, rather towards reconciling the division between us. I am, therefore, rather sorry for the tone of Mr. Powys's letter. He evidently knows so much more than I do of newspaper methods and what he calls "the game of newspaper controversy," since he says so much about it in his letter, that I cheerfully yield the palm to him, knowing so little about them myself. He complains of misquotations, and I will at once say, in comparing them with his actual words, that in the interests of brevity I condensed them and certain of them should not have appeared as actual quotations. For instance, whereas I wrote "puerile imitation," what he actually said was (*The Times*, August 4), "puerile efforts to renew the unrenewable past"; whereas I referred to "forgery" and "falsification of history," he spoke of "deceptive imitation" and "subversive alike of historical value." I leave the reader to distinguish between them, and to those familiar with the utterances of the Society's Secretary, have I not rather understated than overstated the case? At the same time I apologise to him for the quotation marks which, in a precis of what he said, should not have been in certain cases included.

Mr. Powys made certain statements, such as "Tinkering with stone surface is as harmful to old masonry as the addition of modern stained glass to ancient stained glass windows," to which I replied that exceptions must be made to any such doctrine. I deprecated this and other remarks of his as setting up an abstract approach towards practical matters, which are better judged on their own merits. I thought such an attitude rather stereotyped and likely to do harm, and am less concerned with pious generalisations—all very nice but rather woolly—than with the way in which they are interpreted in practice, and his interpretation seemed to me lacking in imagination. Our love of the past should not lead us to become the mere lackeys of it, and properly understood—to value it rightly we should value it lightly.

There are cases, I venture to think, where the harmony which has melted away, in such cases of decay as I instanced, can be recreated if the right sort of craftsmen were employed to do it. I do not, any more than your correspondent, like sham Norman or other revivals attached to old cathedrals as though they were the same, and was not talking about new buildings, but repairs to old ones, and said that it was better in the case of a few missing pieces of glass in an ancient window, "to renew in sympathetic treatment with the original, than to disfigure it with bits of plain matted glass, and I instanced certain windows at Fairford; nor is there any falsification of history or puerile imitation in so doing. Your correspondent, basing his arguments apparently on bad restoration only, falls into the error of comdemning all restoration.

Kubla Khan, which he adduces as an argument against restoration, is the fragment of a poem left unfinished by Coleridge, a case in which we do not know the poet's intention (he is said not to have known it himself). In the case of the window I instanced, we have the context of the whole finished window to direct us, save for the missing fragments. There is, therefore, no application in his illustration. But enough of this, and let us inquire a little closer into the ethics of restoration—and the word is one of such beneficial meaning that to clear it of the misapprehensions with which it is surrounded is a thing we should welcome, for the abuses identified with its name have led us to mix up things very unfortunately. There comes a period when we need to restate our beliefs, lest the adhesions of time, and the changes wrought through it, detach them from life, so that they become mere doctrine and survival, no longer reflecting living thought. This is the case, I think, in regard to restoration which, because of the misuse connected with the name, has prejudiced us against a truer and more reasonable interpretation. The recent controversy over the western towers of Canterbury Cathedral set me thinking furiously, for an air of unreality seemed to be growing over the arguments on the subject, which had the appearance of a set of formulæ only, and of wildly beating the air.

Nineteenth-century restorations present a dismal enough record of replacement and destruction rather than restoration, but what I am anxious to discuss is whether in the altogether healthy reaction against such we may not have fallen into prejudices on the other side. Is such a thing as restoration possible? The purist will answer "No," and in the light of the loss to architecture owing to so-called restoration in the past, he has every excuse for saying so. But why mix up things? Why call this restoration when "mutilation" would fit it so much better? And if that is so, ought we not to distinguish a little better between the two? Is, then, restoration under any circumstances desirable or possible? I have no doubt it is both the one and the other. The purist will tell me that to replace a piece of perished stone carving with new stone work, or cusp to a quatrefoil, a finial to a pinnacle, is but further mutilation and to be characterised as forgery. But is it so, necessarily? Surely the endowment which guides us, the spirit in which we approach it, determines the act more than such phrases.

What is this impenetrable darkness between the past and ourselves which prevents us from feeling and expressing even as they did, unless some retrogression has overtaken life? Were it conceivable that a mason to-day could be in such sympathy with the craftsmanship of an earlier century as to feel without pretence of it and express the same temper—in such a case is it not more desirable to have that stone work renewed, that finial to the pinnacle? I should say certainly, even were it different to other pinnacles near by. Restoration is, therefore, not wrong in itself, but to be judged according to the merits of the case; and is only wrong *because we are not artists enough.* I am not suggesting here that we should restore historic ruins, or that in the case of a largely perished stained glass window we should attempt its rehabilitation. There are many instances, however, in which the renewal required is only of a few pieces of lost or damaged glass or stone work, and to renew these in the likeness of the original, is far better than patches of matted white glass left spotting the window or unworked stone.

Far be it from me to suggest any new campaign of restoration on the old lines. None the less, it is noticeable, if we regard the free period of the best Roman work, or the culmination of the Greek period—or for that matter Egyptian, Assyrian, or any other—that there is a freedom and variety of vital craftsmanship which unites them all together, that life at any time when poised high enough is directed to more or less the same ends, revealing aims which have much in common; that underneath every variety of civilisation there is disclosed a common purpose uniting them all as religion and beauty only can, in a kinship with all humanity. If this is beyond conjecture, and I am certain it is the fact, it is able to relate the spirit of our own work to the ancient past, as the best work belongs to all time. What, then, becomes of charges such as the falsification of history, of puerile imitation and forgery?

When I look at so noble and human a group as that of "An official and his wife (eighth Dynasty)," in the British Museum, the temp of the work, apart from externals of dress, mig adorn any ancient Gothic cathedral, so identic is the spirit and nobility of the work, so timele is its attachment to all that is beautiful and be We have all of us one human heart, and if so of us were not clouded by the abuse of restorati in the past we should find below that the spri of the best human endeavour differs very litt having always as its object to record the mo precious things, which belong to all time. talk, therefore, of "the unrenewable past" only a superficial view of it, because so mu of it can be renewed in ourselves. Why, the should we not, where possible with tender han supply the temporal loss with a like spirit, what it is possible—not much, no doubt to restore? Every man really incorpora humanity in himself whether realised or not, a all the arbitrary distinctions set up between pa and present, thrusting a wedge between the are inventions encouraged by our own dislocat and uncertain aims, which disappear when look at it all a little deeper. All ages at t best have sought much the same things, ev stretching beyond temporal necessities towa beauty and the divine. Is it, then, surprisi that at a certain height there is found unity, division, between them? That when beauty a religion have governed life it has bound together, bound it as the shibboleths of politi liberty and economic necessity in our own d dislocate and undermine it.

Do we not, therefore, exaggerate differen for the purposes of our argument in talking restoration as in itself a crime? But if we lo at it unprejudiced by the abuses of so-call restoration, the gulf between past and pres largely disappears. Nor is it to those who f their common parentage any great thing th they should be able to feel and express in mu the same way. What divides us from the pa is that chiefly which also despoils us of ourselv —the want of freedom and intuition, the deper ence on knowledge and taste as enough themselves.

When we clear away the accumulations wh have hidden from us the reality, there is fou no such difference between past and present some would wish to prove, and it is this nig mare we need to get off our shoulders. allowing abuses to divide us from our inherita or invent a gulf between us.

Demeter's nose must not be omitted from discussion, because it illustrates the importa of resting each case on its merits. There w practical objections in this case which in s others there are not, though still prepared admit, that apart from the practical difficu an Alfred Stevens might even here have justi himself. We can leave Demeter quite hap without her nose, and really to the artist th no great matter, but the window must some sort of glass inserted to preserve it at and this is often the case with masonry. No I refuse my name to a petition for the rem of the nose of that divine patroness of mo earth, so here at least my attitude was "corre

But do not let us be terrified by a word much comfort as that of "restoration," whe are all feeling the need of it so much, or fear it is puerile imitation of the unrenewable to "restore" and enlarge our own concep about it. Past, present and future belon each other as one garment enfolding all and to value the past rightly we must val lightly, but only in the sense that it is the shadow of ourselves, and that its substar within us, linking us with all time and ena us to understand it. For we are men also when I look at some ancient building, wind sculpture I look at myself. This also is m Why, then, should I renounce the patri which thus endows me, and find myself and puerile for feeling as they did? Fo rest I only wished very gently to suggest t S.P.A.B. to keep near to life, to avoid doctrines and a "pedestal" attitude, tha usefulness of its work, with which I so sympathise, may not be impaired.

WITH THE A.A. AT AVIGNON.

(Notes by Our Correspondent.)

Avignon, *Monday.*

PUNCTUALLY at 8 p.m. on September 6 some members of the Architectural Association Victoria en route for Avignon. At Folke- they embarked for Boulogne, which was ed at 12 midnight. A pleasant crossing experienced, and after a short stay the left for Paris, arriving there at 5.15 a.m. early morning ride across Paris in a motor-, which was waiting, took the members to Gare de Lyons, where welcome coffee and were obtained. After a short stroll Paris eft at 8.35 a.m. All arrangements worked thly, and an excellent lunch was obtained he train. Despite the long journey the arrived cheerful and happy, and all sat to dinner at the Hotel du Louvre at 9 p.m. ame day. Here they were joined by Mr. ey Hamp (Past President of the A.A.), thers. On Saturday they were at liberty plore the town at their leisure.

ignon retains all its old-world character, ilt by the work of the pre-war jerry-builder his post-war prototype.

s indeed pleasant to dwell on the charm- d buildings here, coloured by age, the great to pleasant harmonious tones or pleasing sts, the local materials blending so ly with the landscape. The town is n the left bank of the Rhone, above which a rock crowned by the ancient palace of pes and the cathedral. There the build- verlooks the town, and the old fortifica- surrounding it give a remarkably pic- ue appearance.

inhabitants appear to take life easily pleasantly; hustling seems unknown, ps not altogether a disadvantage. The n p. 396 will give an idea of Avignon and roundings, also the position of the bridge uildings illustrated.

weather has been delightfully fine, ng the old town to a great advantage. e members of the party are greatly im- d by its beauty and look forward keenly coming week. Members have come from ections, including Lancashire and Dublin.

The Pope's Palace, Avignon.
From an Etching by Mr. Percy J. Westwood, A.R.I.B.A.

General View of Avignon.

THE DOME: ITS HISTORY AND CONSTRUCTION.—III.

BY SIDNEY TOY, F.S.A., A.R.I.B.A.

THE most successful dome of the Byzantine period, both in respect to beauty of design and science of construction, is that of the Church of S. Sophia, Constantinople, built, after the fall of a previous structure, about A.D. 562. This dome is constructed of brick conical rings, has an internal diameter of 107 ft., and a height of about 48 ft. from the springing level. At its base forty windows divide the brickwork into a like number of buttresses (Fig. 24). The thrust of the dome is counteracted at the east and west by great semi-domes, and on the north and south by barrel vaults reinforced by massive buttresses. These abut against the pendentives in the manner shown in Figs. 24 and 25, the semi-domes themselves being abutted by barrel vaults flanked by smaller semi-domes. Most of the domes built by the Byzantines were abutted on all four sides by barrel vaults, as at S. Sophia, Salonica (Figs. 26 and 20), but in some of the mosques built after the fall of Constantinople abutment was formed on all sides by semi-domes, while in others the two systems were associated, as shown in Fig. 27.

Squinch arches were often employed instead of large pendentives. These are arches thrown across the angles of the square base thereby developing an octagonal form, small pendentives being built at the angles of the octagon, as illustrated in Fig. 28. Early forms of this treatment exist in the Palace at Serbistan in Persia, dating from about A.D. 350, and in some of the tombs in the Via Palestrina at Rome. This construction was adopted at S. Nicodemus, Athens, at Daphni—both dating from the eleventh century—and elsewhere, and became the type of many of the later domes in Western Europe.

From about the tenth century drums were interposed between the dome and its supports, as in the churches at Athens and Daphni, mentioned above, and the church of the Theotokos, Constantinople, the last dating from the thirteenth century. Windows were then pierced in the drum and not in the dome itself, and the buttresses between the windows were decorated with engaged columns with connecting arches above; these arches helping considerably to strengthen the dome at its haunches. If the dome was rib internally the ribs were carried down to base of the drum. In the later phases Byzantine work these drums became virtu towers, as in the Church of The H Apostles, Salonica (Fig. 29). Drums v usually braced by one or more girdle tie timber which were frankly carried stra across the windows.

During the Middle Ages domes were b by the Christians in Italy and France, by the Saracens in Persia, Syria, and Eg

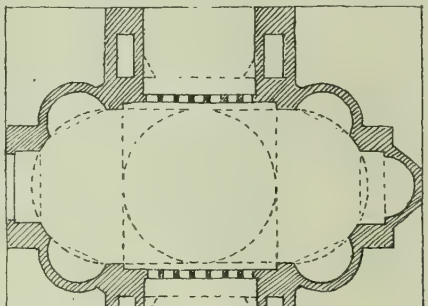

FIG. 25.

their construction in these countries deve ing according to local conditions and requ ments. In Italy brick, stone, or marble used, as the material of the neighbourhood the resources of the community dictated. five domes surmounting the Church of Mark, Venice, dating from the eleventh tury, rest upon pendentives and are of sim character—except that their inner surfa are not ribbed—to that of S. Sophia, C stantinople; the present timber cupolas them being of later date. In the succeed centuries before the Classic Renaissance was the general practice to support the do at the angles of rectangular or polyg spaces on squinch arches, as at the cathed of Siena and Pisa. The dome over the tistery at Pisa is composed of two dist shells, one a cone which covers the cen space and was probably open at the top w first constructed, and the other a sphe cupola pierced at the crown by the inte cone. These shells, which are built of br work, are connected by twelve marble which are spaced at equal intervals round dome and rest upon cross arches in the ga below (Figs. 30 and 31). The main par this work was built between 1153 and 1 but the attic and probably the cupol carries are additions of the fourteenth cent From an æsthetic standpoint the general e of this dome is not happy (Fig. 31). circular and octagonal baptisteries elsew in Italy are usually covered by domes many cases, as at Parma, visible only within since the external wall is ca above the dome and the whole covered secondary roof.

In France, where the material used i construction of domes was chiefly stone, r peculiarities are observed. The ea example is that over the west bay of Church of St. Etienne, Périgueux. This has an ovoid form and rests upon pender which are built in horizontal courses. S. Front, in the same city, built about there are five domes. The pendentives are not parts of true spheres but, in ord diminish their projection, are deflected wards and a curious twist is develope their faces in their adjustment to the verse arches. The domes above hav ovoid form, and their faces at the spri are set back slightly from the upper ed the pendentives. All these variations the Byzantine forms have the effect o flecting the lateral thrust in a vertical tion. Both of the churches at Périg

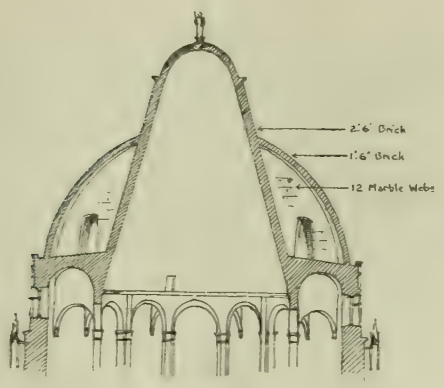

FIG. 30.

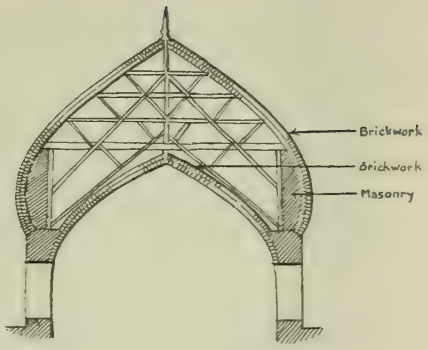

FIG. 32.

oned above, have been considerably
ed. but the peculiarities noted are
al.

Persia the pointed bulbous forms were
d with little variation. The domes
generally composed of two shells, the
one exposed to the interior, and the
and bulbous shell, which is supported
on timber framework, seen only from
tside, as shown in Fig. 32. In Egypt
yzantine forms were followed in the
mosques. At Constantinople, after its
1453, a great number of mosques were
y the conquerors under the direction of
architects. These were covered with
constructed after the pattern of S.
and differing from that model mainly
manner of abutment offered to the
of the pendentives. In the
aniyeh, built 1550-56, the dual method,
s, partly by semi-domes and partly by
vaults reinforced by buttresses, as at
hia (Fig. 24), is adopted, though here
rrel vaults are enclosed within the
g and the end walls erected near their
faces. In the mosques of Shah-Zadeh,
8, and of Ahmed I, 1608-14, the pen-
es are abutted on all four sides by
omes.

HIBITION NOTES.

NSTITUTE OF INDUSTRIAL ART.

uthorities of the Victoria and Albert
, in housing yet another exhibition of
stitute, have, no doubt, in view to en-
the drawing together of art and industry,
n industry with art. Anything which
her this aim deserves our warm approval,
ld we lose heart because the enterprise
ded with many difficulties. At the
me, in the exhibits brought together,
evidence of progress. We must not,

hich, making the present level of
production its starting point, selects
t of it, or at any rate aims to do so,
ines with it the more personal pro-
artists and craftsmen working in
directions as an inspiration towards
utlook.

Though far from being wholly representative of modern craftsmanship, the exhibition shows a very wide range of creditable work, which we propose to review in a later issue. It is somewhat anomalous in such an exhibition to find as one pole of it the very personal and accomplished work of Mrs. Phœbe Stabler, and as the other the stand labelled "Nottingham Lace," for what may not such a scope include? Yet we realise the great difficulties which are perhaps inherent in such an aim. Whether one or other of such exhibits should not be there were difficult to decide, but in such case why not the whole of Oxford or Regent-street? We would only say to the promoters, do not ask too much from the good craftsman, lest the trade should establish in his mind that his place is elsewhere.

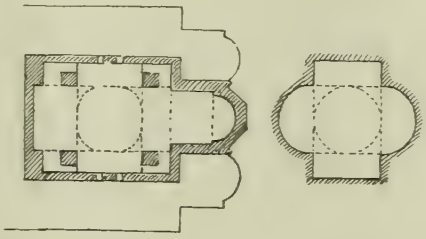

FIG. 26. FIG. 27.

LONDON SALON OF PHOTOGRAPHY.

The first impression of the London Salon of Photography Exhibition is more that of a series of pleasing tone pictures than of photography as we usually think of it. Take such examples as Nos. 244, 130, 86, 79, 76, 57, 38 or 29 and one sees that herein the artist has made his medium subservient to his will. Scores of photographs published in our daily papers could be controlled and modified with little effort from the hands of an artist to soften and distinguish the appeal. Where the technical values in the photograph are at their highest the picture value is sometimes the worst, but in such a subject as "The Abyss" (86), by Alex. Keighley, the technician and the artist achieve a very fine result. When you come to a photograph by the new reticulating process (374), by L. J. G. van Ewyk, you may rouse the instincts of the mosaicist, for such prints translated into colour mosaics might be admirable. Amongst excellent architectural subjects should be noted 244, 262, 300, 164, 53 and 42.

The Incorporation of Architects in Scotland.

We have received the Summer number of the *Quarterly Illustrated* of the Incorporation of Architects in Scotland, which is an attractive publication. It contains a paper on "Reinforced Concrete Construction," by Mr. George Allen; "Towns and Town Planning—Ancient and Modern," by Messrs. T. H. Hughes and E. A. C. Lamborn; an account of the Editor's holiday on the Norfolk Broads, &c.; particulars of the British Architects' Conference in Edinburgh this year; and Council notes. (Edinburgh: 15, Rutland-square. Price, 1s.).

HAMPSHIRE ARCHITECTS' ASSOCIATION.

HAMPSHIRE and Isle of Wight Architects' Association held their annual exhibition at the Municipal Art School, Bournemouth, last week. There were drawings loaned by the Royal Institute of British Architects, and executed by competitors for the various studentships offered annually by the Institute. The exhibition also comprised work done by the students of the local Association and illustrations of the work of Hampshire architects who are members of the Association. Drawings loaned by the Royal Institute of British Architects included the design for the Campidoglio, Rome, which won the silver medal, and a design for the Italian Embassy, which was awarded the Tite prize. At the opening ceremony, the Mayor of Bournemouth (Alderman C. H. Cartwright) officially welcomed the members, and referred to the presence of Mr. J. A. Gotch, president of the Royal Institute of British Architects. Mr. A. L. Roberts, the Hampshire County Council Architect (occupying the chair in the absence of the President, Sir William Portal), highly eulogised the services to architecture of Mr. Gotch, whose election to the presidency of the R.I.B.A. stood, he believed, for a closer bond of union between the Institution and its allied societies. The architectural education of the public was equal to, if not of greater importance than, that of students.

Armstrong College Library Competition.

We illustrate this week the second and third premiated designs in the Armstrong College Library Competition, by Mr. W. G. Newton, F.R.I.B.A., and Messrs. Mauchlen and Weightman, respectively. The first premiated design, by Mr. A. Dunbar Smith, F.R.I.B.A., was given in our last issue. Some notes on the designs submitted are given on p. 397.

St. Catherine's Church, Hammersmith.

St. Catherine's Church, Hammersmith, has been erected out of the proceeds of the sale of the site of St. Katherine Coleman, one of the condemned City churches, and direct continuation between the two churches has been secured by the re-erection of all fixtures of St. Katherine Coleman worthy of preservation.

The problem has been to provide at a reasonable cost a thoroughly well-built church, with a seating capacity of 500 in the nave, 40 in the choir, and 60 in the chapel.

The interior is one large hall, 44 ft. in width and 45 ft. in height, barrel vaulted, in fibrous plasterwork. Owing to the employment of steel in the construction of this church it was erected in a little over six months, at a cost of £16,000, a cost which would have been double under the old conditions. Steel framing has enabled the walls to be kept thin, and spaces have been left to form ducts. Dr. Oscar Faber, O.B.E., was the consulting engineer for the steel work. London stocks have been used throughout, and effect has been obtained by simplicity of mass and proportion, without the addition of ornaments or moulding. The roof is covered with buff pantiles.

The question of acoustics has been carefully considered and the end wall padded to avoid any ill effects due to the barrel vaulting. Mr. Hope Bagenal, A.R.I.B.A., was consulted on the question of acoustics.

The general contractors were Messrs. John McManus, Ltd., and the sub-contractors included:—Bricks, Eastwoods, Ltd.; casements, R. E. Pearse & Co., Ltd.; pantiles, William Saint, Ltd.; constructional steel, A. Dawnay & Sons, Ltd.; door and window furniture, James Gibbons, Ltd.; electric light installation, Grierson, Ltd.; special electric fittings, Louis Dernier & Hamlyn, and Heal & Sons; wood flooring, Stevens & Adams; heating and ventilation, J. Jeffreys & Co.; pews, Hampshire House Workshops, Ltd.; marble work, Fenning & Co.; ornamental metal work, Thos. Elsley, Ltd.; plasterwork, Samuel Wright & Co.

Mr. Robert Atkinson, F.R.I.B.A., is the architect.

House at Hamble.

Messrs. Baillie Scott & Beresford are the architects of this house, which occupies a fine site overlooking the liner anchorage in Southampton Water. Lawrence's bricks of mixed colours are used for facings, with old tiled roof. The plans illustrated show the lay-out and position of the various rooms. The interior is on Georgian lines, with panelled rooms. A feature will be made of the garden, which will be laid out on formal lines by the architects. The builder is Mr. H. G. Ross, of Netley Abbey; casements and leaded lights were supplied by Messrs. George Wragge, Ltd., of London.

Design for Residential Club, Chelsea.

This design, by Mr. Arthur T. Bolton, F.R.I.B.A., was made for a client interested in Ingram House, Stockwell, as a development of that scheme in the direction of providing, in place of the large number of club rooms of the former scheme, a series of private studies. It was also desired to utilise a more expensive site, but on the same scale of members' payments. A further condition was that the resident manager's house should be in the main building, instead of being in a detached house on the site, as in the club actually built. Certain other modifications were also introduced into the original scheme.

Proposed Flats, Eastbourne.

The block illustrated consists of sixteen self-contained flats, served by two staircases. Each flat comprises a sitting-room, kitchen, two bedrooms, bath, and w.c., the idea being that they would be used by people of small means. Economy of planning has been one of the main objects, and an effort has been made to keep the building in harmony with the locality. The architects are Messrs. Cheadle & Harding, of 2, New-square, Lincoln's-inn, W.C.2.

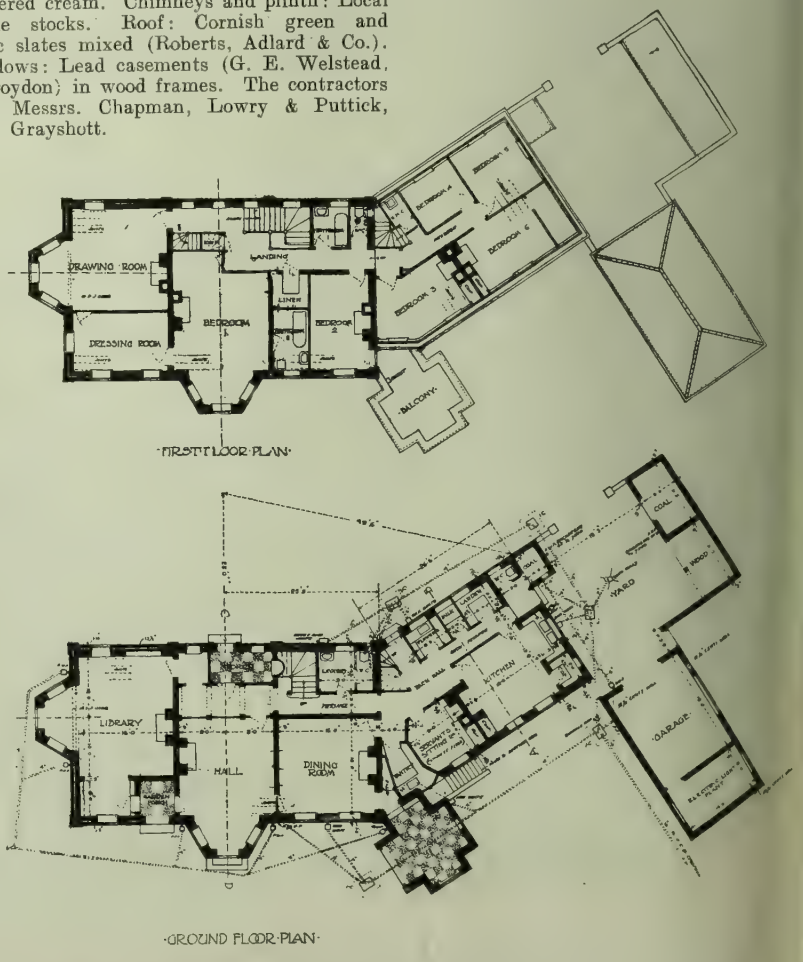
House near Guildford.

This house is 1½ miles from Guildford, and was recently completed. The view shown is of the south and west sides. The materials used are:—Walls: Local wire-cut bricks distempered cream. Chimneys and plinth: Local purple stocks. Roof: Cornish green and rustic slates mixed (Roberts, Adlard & Co.). Windows: Lead casements (G. E. Welstead, of Croydon) in wood frames. The contractors were Messrs. Chapman, Lowry & Puttick, Ltd., Grayshott.

The house has a large sitting-room, 40 by 21 ft., divisible into two by sliding doo and the whole panelled in walnut; a ha small study, 7 bedrooms, 2 bathrooms, a usual offices; with gardener's cottage attache and with approach from the house for p poses of caretaking. The loggia, shown the drawing, is of teak, untreated.

The architects are Messrs. Knapp-Fish Powell & Russell, of 133, Ebury-street.

Messrs. Cassells' New Premises.



In conjunction with the reconstruction Messrs. Cassells' premises in La Be Sauvage-yard, Ludgate-hill, E.C., we ill trate the new front to No. 5 Building, wh is now the chief entrance at the north end La Belle Sauvage-yard.

The main buildings internally are being modelled and equipped with central heatin electric lighting, sprinklers, and vacu cleaning; the extension of the floors to ca very heavy machinery; erection of goods lif and other works.

For the sculpture over the entrance d inspiration has been sought in "The Beau ful Savage" as the chief *motif*.

The architects are Mr. Sydney Tatche F.R.I.B.A., and his partner, Mr. Geoffrey Wilson, A.R.I.B.A. (Messrs. Bourchi Tatchell & Galsworthy); the carving has be executed by Mr. George Alexander.

Messrs. Higgs & Hill are the general co tractors, and the principal sub-contracto are:—Constructional steelwork, J. Lysag Ltd.; lifts, Wm. Wadsworth & Sons; me windows, C. E. Welstead, Ltd.; lanter skylights, etc., Luxfer Co., Ltd.; sprinkle Mather & Platt, Ltd.; grille and bronze wo F. G. & S. H. Frost; heating, J. Jeffreys Co., Ltd.; electric light, Jacob, White & C Ltd.; vacuum cleaning, British Vacu Cleaner Co., Ltd.; decorations, G. & Brown, Ltd.

COLLINGWOOD TOWER CAMBERLEY SURREY

Mr. H. Reginald Poulter, Architect.

Design for Nurses' Home, The Retreat, York.

By Messrs. Ernest G. Allen, F.R.I.B.A., & Partners.

[This design was submitted by Messrs. Ernest G. Allen, F.R.I.B.A., & Partners, in the limited competition recently held. The materials proposed to be used were brindled stocks with red quoins and string courses, stone centre feature, and sand-faced tiled roof.]

LONDON BRICKWORK.

By A. E. RICHARDSON, F.R.I.B.A.

THE brickwork of London in substance and aracter is as familiar as the plane trees that d kindly shade to the protected oases in the y's midst. To metropolitan eyes it appears vitable, and for that reason is accepted hout enquiry. The foreigner, unaccustomed its precision and reticence, sighs for the erficial brightness of the Continental cities h which he is acquainted. Such conventional nery as is presented by the older quarters of ndon does not enter into French, Spanish or lian conceptions of building values in masses. ing English, the average citizen, who is a ndoner as well, is prone to listen to censure l to take for granted all that he is told; thus as come about that brickwork is relegated the level of a corduroy material, rough in ture and not fit for polite society.

A little reflection will show the reverse to be case. Here is a fine building system of glish mould, stern and unbending it is true; irst glance forbidding, but capable and strong. h a reserve and dignity holding the secrets centuries. We hear to-day of schemes for ivening the town; some there are who uld have the house fronts, now plain, be-ened with ceramics, while others suggest the dual rebuilding of the streets in Portland ne. Such ideas rouse little zest, for it is rious that London has a character of its own ich no Jacob's coating would better. Is it not mly that modern Babylon should in the main built of rectangular blocks of burnt clay, with ly dressed Portland stone to carry the lence of the public buildings? Does not this at city possess the glories of Wren's mind, silhouette of Paul's and the attendant fleet churches, as well as the pencilled lines of the bey and the palace of Westminster? The ventional scenery of inner London is mighty l impressive; it is as a stage set for the coming l going of myriads of players; the exits and entrances defy analysis. It is an assemblage vertical walls pierced into countless openings, surface of a colour and texture indefinable, mass, of an obscurity remote; by day teem-with movement, at night populous with the rits of other times. Here within the acres of kwork is concentrated the genius of the race; e the seemingly expressionless house fronts e gathered on their external surface a stallisation of thought and action denied to superficialities of Paris or the forbidding ects of Berlin.

t one time the Londoner took a pride in his ve brickwork; we have the authority of yle for the beauty of Chelsea, and are aware he scorn he poured upon the acrid putre-ces of Belgravia. To ordinary eyes London kwork is dull, drab and dirty; no thought ven to its humane properties, to the beauty s proportions, or to the size of the indi-al bricks which come so readily to hand are an index to the vastness of the idea. le outwardly expressing contempt, the hetic Londoner does not suggest that t clay for walling is bad in itself, any more he sees fit to question the squared flag-es of the ancient footways or the official ing of the street lamp-post. His penul-te reason is that common brickwork is as ane to the fact of his being as the clay dation upon which the city stands and gh which the river flows.

is a pleasant thought, the bricky nature of netropolis, the cube masses made up of l cubes, the comparatively insignificant and nonplace giving scale and coherence to whole. Egypt and Babylonia never saw ike. The Roman who strengthened the of Verulamium with courses of long bricks unknowingly provided ready-made material he Norman), in his rare visionary moods not foresee the day when the shores of hames would stand stiff with the clay he trod underfoot. The diversity of London walling is a study in itself; every house-has a marked individuality, every street possesses a clannish aloofness. Where to the casual observer everything seems alike, to the penetrating eye there is as much expression and interest as exists among the crowd of faces that pass and repass. For the truth is that brick-work is graded as is humanity.

There is rich brickwork and middling, shabby gentility stands nigh poverty, arrogance keeps company with dignity. The learned wax eloquent of the secrets of cuneiform and remain ignorant of the story set forth in the straightened lines of London walls, truths indelibly impressed in terms of dressed clay. It is a fascinating theme, so apparent and so alluring, perhaps because of its familiarity; in all but the plain telling of the tale can be explained the reason for the neglect. All writers and poets have felt the mighty spell of the city and have sung its praises; artists have limned its changing countenance; yet the epic value of its principal building material has escaped the points of mighty pens. It is both false and unfair to say that with such a material the old town is dull. The very nature of the burnt earth blocks, the size, the shape, and the colour, forbid defamation. With what readiness bricks can be lifted, with what regularity they can be spaced; and how monotonously interesting the coursed masses appear, demonstrating as nothing else does or can the ceaseless persistency of the English, no less than the *terribilita* of modern development. With such walls and such interest London can never become a Babiuitha. From the Conquest to the Great Fire it was a city of timber, of tile and thatch. At the time of the Reformation parts of the capital were expressed in terms of mediæval brickwork and terracotta in imitation of Wolsey's ambitions at Hampton Court.

After the Fire, when London, like a phœnix, rose anew from the embers of mediævalism, brick was the material universally adopted by Act of Parliament and Corporation behest for the new houses. With Sir Christopher Wren at the head of affairs a new complexion was given to the narrow streets and alleys—Portland stone for the ruling buildings and brick for the lesser. Men remembered the line of fortifications set up in Old Noll's time to the north of the city against the forces of the king, as well as the fields beyond; and it was hereabouts that London's bricks of the late seventeenth century were made. So revived the craft and mystery of brickmaking and bricklaying on a scale which rendered the labours of Inigo Jones insignificant, and threw into obscurity the bricky essays of Lincoln's Inn, which Ben Jonson, as an unwilling votary, rang his trowel upon.

Under the hands of Wren's men the forest of scaffold poles quickly gave place to walling of plum-coloured London brick, enriched, as taste decreed and purse allowed, with cutters for the string courses to mark floor levels, and purpose-moulded sections for cornices fully charged, denticular, or plain. Then it was that King Clay came to the assistance of Gog and Magog, still smarting from their burns, attended by a host of rubicund and leather-aproned courtiers, who could pick up the mysteries of gauged work recently out of Holland, construct the rubbed brick enrichments of King's Bench Walk or the pilasters of Christ's Hospital from Wren's "details in great," or temper the varying surfaces of the master's additions to Hampton Court. Nor was the art of the chiseller neglected, for the finely-gauged brickwork with its delicate putty joints admitted of carved ornament such as palmettes and the dimpled heads of cherubs, so expressive of the new era. With so much building the bricklayer became a man of consequence and, as history records, even an aspirant to the status of architect.

As the walls show, the modern spirit of London began with the works of Wren. Save for surface differences, an increased busyness, or additional interest of misplaced ornament, the aspect of things insular is much the same as when Charles the Second sauntered at Whitehall. What is true of the house fronts applies equally to those who inhabit them. Kind houses, pleasant people, repellent walls and hard faces. There are times when the brickwork becomes friendly, even on days of murk; there are hours when one longs to escape into the distant fields, especially when the mood tends to feelings of hypochondria and the vastness of the labyrinth depresses. There is something of fantasy in the different heights of the bricky cliffs, something so extraordinary and unexpected, so grotesque yet so explicit as to cause speculation why Englishmen consent to voluntary imprisonment within such neatly sashed boxes. The conventional scenery is the natural dress; it is inexpensive, it is conducive to privacy, it is at once democratic and unassuming. Outwardly, to all but the initiated, the houses look the same; but personal idiosyncrasies are expressed at a score of points. Is not the earthy character of the bulk of London, its disciplinings and rulings, its ultra-respectability and aloofness necessary to the brilliancy of Cockney wit?

Londoners glory in horizontality; they have no shame about their chimney-pots, which they affect not to see. It needed a Canaletti to climb the roof and draw the skyline of the City which Wren devised before the average man realised the contour of Paul's dome and the fingers of the churches extolling the majesty of the skyscape. Study the brickwork of London and the minute history of the last three centuries stands forth; it is as though one had at one's disposal a mighty diary of events wherewith to gauge modern progress. It is possible to read history anew, course by course, so to speak, for the burnt clay is always true. Stuart brickwork has the interest of being the lineal successor to the Tudor tradition as well as parent to the walling of Queen Anne's day. It is a voluminous material, as intriguing as the draperies of Lely's beauties or the cloaks of Kneller's men.

It has its lighter expressions, such as the bowtells to the arrises of windows, its swathing bands of the rebirth of Classicism, its gauged brick arches and quoins, with a gamut of ornamental quips and conceits, as self-searching, condemnatory and good-humoured as the most entertaining extracts from the gossip of the inimitable secretary.

From the days of the Great Fire to the hour of Queen Anne's death, English brickwork had a prestige to which homage was paid in the distant lands of Virginia or Pennsylvania. Not only could the craft claim ancestry from Plantagenet and Tudor England, but it had taken lessons in deportment from the polite masters of Flanders and Holland. King Clay, with his lesser king and queen, closers, his head-men, longmen and batmen had made great advances. His was a cheerful countenance, as yet ungrimed by the conspiracies of King Coal and his myrmidons, his rulings acknowledged by city and court alike. He was truly free of London and at home east of Temple Bar or at the Court of St. James's. Common Clay, indeed, not in those times. A right royal material, forsooth, and one most fitting for the walls of English homes.

The compromise between things mediæval and things modern can be dated from the rebuilding after the Fire. London, it is true, came under the thawing influence of Classicism at this time, but she found material for her physical substance from the neighbouring soil, nay, from among the very bones of those of her dead, whose bodies in a sufficiency commingled with the earth. Perhaps the gloomy thought, common to all, of Cockayne, "When I am bricks and mortar," originated with Wren's building activity. Will Mr. Austin oblige and set the theme to harpsichord music to jingle with "Oranges and Lemons," or other catches equally rich and gay? The bricklayers, who, in the days of Old Rowley, worked their will upon the streets of London, took more than a passing interest in their craft; they were men of longevity, but all did not live to see the prolific outpourings of Hogarth who, in his delineations of life and scenery in London, acted as the chief missioner of mid-eighteenth-century custom. With the advent of George the First, a slight departure came over the

external treatment of brickwork. The master bricklayers, quick to respond to novelty, expressed the new regime of Walpole and the heavy German retainers of the Hanoverian court by forming segmental arches over the windows to the house fronts. It was as though the humbler sort of people wished to register their resentment at the appearance of such interlopers by raising a protesting eyebrow *in perpetuo*.

So we pass in review, aided by the topography of the streets, to the year 1728—a fine period and a merry—with Ripley building the Admiralty, London going out of town westerly from Holborn along the Oxford-road, and Mayfair in the making. What a delectable background for Gay's "Trivia," and how delightfully the panniers of the women's skirts and the frogged coats of the men harmonised with the brickwork and white paint. To the eyes of Lord Burlington, as Kipps shows in his views, the best streets stood at attention, accoutred and pipeclayed like Grenadiers on parade. The scene changes again. Another George succeeds to the emblem of Lion and Unicorn. Windows are straightened at the heads; plum-coloured brick gives place to the latest mode of yellow stocks or malms—the best kind of building bricks. Then his Grace of Devonshire instructs Mr. Kent to build the mansion in Piccadilly (which will soon be hacked down). It is reasonable to think on all the bricklayers of London making trips in their Sunday finery to the ruralities of Piccadilly to see the cut of the latest Palladian mode. The benchers of the Inner Temple, eager to be in the fashion, order the new buildings of Crown Office-row to be devised in similar taste; and it is not long before Mr. Robert Taylor, the rising city architect, follows suit for his building, No. 35, Lincoln's Inn-fields. The years pass. Wren's bells toll; another George is gathered to his fathers; and then a clash—long live George the Third. There is great activity among the stage hands; new figures appear to add their quota, for the settings have to stand for sixty years.

There is Mr. William Chambers, high in Court favour; there are the Paines (father and son); and Athenian Stuart, fresh from the stone quarries of Greece; as well as the loquacious Adelphi from North Britain, who are to cast their oatmeal upon the very waters of the River. Small wonder that the latter caused surprise to the Tory craftsmen of London by importing bricklayers from Caledonia to lay bricks in the Strand to the skirl of the bagpipes, at a rate of pay lower than that allowed in the capital. It was not long before the Scotch bricklayers were enticed away, to be replaced by Irishmen from Dublin, who walked the scaffolding and founded the Irish colony in Seven Dials. Now we are in touch with the bricky fastnesses that Dr. Johnson and his circle knew, the homes of Reynolds and the coterie who established the Royal Academy and kept great state within the austerities of Berners-street; or we can make pilgrimage to the mansion in Portman-square, which Stuart built for Mrs. Montague, the blue stocking, who discomfited both wits and fops. It is apparent that the Brothers Adam and the tribe of Wyatt's knew how to interpret the Macaroni spirit of Carlisle House and the Pantheon. By the year 1770, it became the rage to add stringings of Liardet's cement to the honest facing of London brick, both old and new work being thus furbished to accord with the lacings of genteel tailoring. Robert Adam and his able brothers were forced to use brickwork for their speculations in the Adelphi and Portland-place, but their instinct for finely jointed stone never departed, and when they built the two sides of Fitzroy-square, towards the end of their lives, they chose to face the work with a veneer of marbled Portland.

At the close of the eighteenth century, by virtue of years, not the termination of its spirit, we are to see the passing of those whose labours had lent lustre to the streets. Mr. Henry Holland, the unofficial architect of the Whig party, is to engage on his speculations at Albany-chambers and to tempt London society to rent his houses in Sloane-street. We are confronted at this date with an abnormal building development—the heights of Pentonville are to be bricked, the meadows of Somers Town and Camden to be cut up into lots, and new dormitories to spring up at Stamford Hill and Clapton. Even the years of depression and volunteering by parishes, when Pitt saw no further use for the map of Europe, did not check the passion for bricks and mortar. The Regency brought forth Nash as the chief exponent of vast building schemes; he it was who devised the uniform of stucco, over rough brickwork, for the Crown properties; but there were a few nobles, such as the owner of Bath House, in Piccadilly, who preferred experiments in rubbed stock brick for the whole of the exterior walling. And so, through the succeeding reigns of George the Fourth and William (the sailor king), London developed its brickwork for the housing of its population. From 1805 onwards, the vacant lands of Bloomsbury were shaped into squares and crescents, thanks to Repton and Burton (the builder). While the Oxford-road, jealous of the new road to Paddington, extended its dressings to Tyburn preparatory to turning northwesterly along the Edgware-road. The late seventeenth century tradition persisted, but the brickwork took on the colour of sherry and marsala; it was losing the cheery figuring of earlier times. By this day, the inner ring of brickfields were encumbered with piles of buildings and the workers of burnt clay had perforce to carry their trade into the suburbs. There were kilns at Ball's Pond; at Camden Town; and near the York-road; there were others at New North-road, at Upper Clapton, Highgate and Finchley; and a few brickfields existed at Canonbury and Stoke Newington. All have served their turn and have long been swallowed in the capacious maw of London.

Such is the romance of brickwork that one ceases to wonder why so much can be said for a rectangular block of clay; but such are the varieties of its colouring, of its size and moulding, no less than the concentrated thought spent upon its production, that the greater wonder is that its properties are not now generally valued. With the accession of Queen Victoria and the perfecting of machinery, the technique of brickmaking underwent many changes. The railroad era brought into being the hard bakings beloved of railway practic There were tunnels and viaducts to construc immense embankments to buttress, and buil ings of a design and purpose without precede Such examples could not fail to change t style of town domestic architecture, and things became more matter of fact and le soulful, until the newer streets took on t frigidity of the 'forties and 'fifties, which d so much to harm the reputation of the earli work.

It is half-a-century since the interest in sou brickwork of a pleasant texture was first revive thanks to the skill of Norman Shaw and Ed Nesfield and the drawings of Kate Greenaw and Caldecott. In the hurly-burly of to-da we are prone to ignore the experimental subu of Bedford Park and its imitations. But it good to notice that English brickwork, as fi if not better than that of the best periods, now recognised as of value even for Governme housing. Never again must this nation material be allowed to sink into mediocrit It has not been possible in this article to avoi a few technical expressions—the jargon of th trade is best stated in the standard works but observant Londoners have a real affectio for the brick walls of their city; they hav sympathy for the velvet coating added by time and hail the coming of spring as much for th newness of white paint contrasting with the so sooty renderings, as they do when they see th lilac budding in the squares. London is a cit of fascination, a city of surprises of breadt and mileage; it is both transient and permanen if that be possible. There is a warm look abou the shabby coat that hides a pleasant heart It may, as Shelley states, be like Hell, bot populous and smoky, but its memory neve fades and its character is adamant.

Seventeenth-Century Art.

Dr. Percy Dearmer's course of lantern lectur on Seventeenth-Century Art will begin this ter in the Great Hall of King's College on October The lectures will be on the ten Tuesdays of ter at 5.30 p.m. Admission for non-members of th University is by a shilling ticket, obtainable the door. The course will begin with summari of sixteenth-century painting, and will inclu Baroque architecture, Bernini, El Greco ar Velasquez.

Woodbury Court House, U.S.A.
MR. W. L. STEELE, Architect.

HOUSES AND ESTATE AGENTS.

A PERUSAL of the advertisement columns of newspapers will show that the Rent triction Acts have put an end to the ing of houses, as, with hardly any excep-s, houses are only offered for sale. There class very hardly hit by this outcome of t Restriction, and that is the class who afford to rent a house at a good rental, whose financial circumstances do not ble them to purchase. Such persons were ing for some relief had the recommendation he Rent Committee been adopted and the ses of higher value been decontrolled at , but this class has received no consideration n Parliament, whose attention has been centrated on the sitting tenant who has ained and retained an entirely privileged tion, although he is very likely not so rving of sympathy as those persons who, ng to the war, were compelled to give up r houses, and now cannot secure another e. Rent Restriction is to be continued in form or another until the year 1930, and it ery doubtful if the provision inserted in the Act, section 2, subsection (2), will to any t degree lead to houses being offered on e so long as Rent Restriction is in force at

hen, as to the houses offered for sale in the ertisement columns of the newspapers, it ld appear to casual observers that there are reat many houses on the market, and so e are, but only *at a price*. Whilst rents are ricted prices of houses are not, and would-purchasers are finding out that prices are nibitive. Indeed, it may be doubted whether e are many really anxious sellers in the ket at all; but many owners, recognising the present boom cannot last, are tenta-ly offering their houses for sale whilst ding in them, feeling it wise if a fancy price be obtained to secure that price before a occurs in the market.

louses that were built for comparatively ll sums and for a different class of occupier, being offered as "gentlemen's residences" at e or four times their original value or cost, cially in the case of houses which are com-t and can be worked with a small staff. An er can ask what he pleases for his house, we who deprecate restrictions of any kind ld be the last to suggest any form of control; it must be remembered these high prices the result of Rent Restriction to a large ee, and they show the evils of a one-sided icted market. The Government's assurance assessments shall not be based upon the nt prices paid also tends to keep up prices, purchaser would hesitate to give a fancy if he felt he would be assessed for all time ne basis of the sum given.

may be wondered why we have headed article "Houses and House Agents," but hink the present state of the market has a of interest to agents. The public is begin-to weary of visiting small houses described uses of a superior character, and of finding price a purely speculative price, with the quence that house agents' advertisements eing discounted. Travelling is irksome and costly, and, after half-a-dozen or so wild chases, the would-be purchaser turns to te sources or gives up the search. If an r can ask what he likes for his property gent cannot restrain him, and he must e best he can for his client, who naturally is his own property through rose-tinted cles; but the agent also owes some duty e public, and this is what makes his task nely difficult—a fact not perhaps suffici-appreciated by the persons who deal gh agents. But perhaps agents can do hing to discourage owners from asking prices under a description unrecognisable to the owner, and thus save the public disappointment, which in the long run affect the agency business, and we think a matter deserving their serious attention.

Of course, in very many cases the agent has to rely entirely upon the owner's statement, but in some cases, after inspection, the description of the property may be termed too favourable, if not misleading. We must not be taken to be offering a criticism on the practice of agents, as our only object in the above observations is to point out that the present condition of affairs is bad for the business. If we are correct in our assumption that fancy prices in the nature of a speculation are now being asked for houses, the agents will be wise in their own interest if they can check this inclination on the part of owners and also secure greater accuracy in the description and particulars of the properties, and at the same time they will be doing a public service. When the lighter press begins to make serious jokes about house agents' advertisements it is a sign that the public is beginning to tire, and that something should be done to ensure greater accuracy.

We may conclude with one other suggestion. In advertisements it is too often the custom not to mention where the property is situated and the price. Now, even the most open-minded purchaser has preconceived ideas on both these questions, and does not desire to make useless inquiry, and thus it would encourage business if better information was always given on both these points.

Oakleigh Hall School Chapel, Cirencester.
Mr. LEONARD W. BARNARD, F.R.I.B.A., Architect.

PROBLEM OF COUNTRY HANDICRAFTS.

By JAMES GUTHRIE.

The handicrafts which belong to the soil, and have been passed on and developed from the days before history was written or æsthetics were invented, do not bear the touch of any self-conscious art nor competition with manufactured substitutes. In the labourer we see a social or political fact; but have forgotten that he was, and still sometimes is, a craftsman whose forefathers were skilled in many useful arts. Wood and straw and clay and iron were the raw material of houses and wagons and pots, things which belonged to everyday life, to be worn out and broken, but always in constant demand. Improvement came by no sudden burst of originality. A chair, a plough, a wheel, were beyond the reach of anything like singularity of form; recognised for what they were, use and use alone being the reason for variety.

George Sturt, writing of the craft of the wheelwright, says that "Wagons grew into beauty not to please artists who gushed about them, but to satisfy carters and to suit the exigencies of field and crop and road." This might be the text of handicraft as a whole at its best, for none of it—not even painting—exists to please artists who gush, but is in some sort the logic of the material and the fulfilment of some clear intention.

Plain ideas about what is right craftsmanship, however, are planted by familiarity with a craft, and are hardly within any writer's power to describe or prove. The bold definition of traditional handicraft on the land marks something established in the mind, something native and familiar, even in decay, which cannot be gainsaid. With equal certainty, unfortunately, it cannot be promoted in any lighthearted or superficial way by planting the product of the art school amid the puzzling and contrary conditions of the country. The culture of cities might bear within it some sound and fruitful seed; but the loss of old traditional handicraft which we suffer—by altered forms of locomotion, for example—cannot conceivably be made good. The rule of use still obtains in despite of outward change: art is still a function in the social body which recognises no class as superior or inferior, though itself often enough disguised as a mere amenity or recreation. But once the wagon, with its bow and stern, topsides, ribs, strakes, and gunwale, intricately beautiful and precise in design and workmanship, has been superseded by the motor-lorry, no wit or contrivance can assemble those craftsmen again, or bring into being a thing for the sake of beauty comparable in any way with that which was for the sake of use.

At the outset, therefore, much discouraging reflection lies between us and our desire to witness some real attempt at giving the arts and handicrafts a local habitation and a name beyond the bounds of cities and towns. Optimism does us no service in this cause so long as we adopt it by way of escape from doubts and uncomfortable facts that are less disquieting when they have been set upon their feet and measured. For, after all, the survival of the arts is a fact with the rest, and use is a term which might bear extension without arriving at the contrary belief in art as a detached unnecessary ebullience of high spirits which the modern world can only afford to indulge in after office hours.

The spirit of deliberation has been singularly wanting. Nobody has come forward and said "by planning upon this and that design we shall arrive at a certain end," because apparently it has not been thought that the analogy of graphic design holds good, or good enough, in broader, larger concerns. Since it obviously does and must hold good, since there is, indeed, no other way to arrive at the definition of an idea, the building of a liner, or at any kind of coherent structure whatever, it is more than time that we discarded idle scattered individualism, and sought by wit, experience, and imagination to build a comely weathertight house for the arts to live in.

It either is or is not a tangible benefit to a country and a nation that the arts and handicrafts exist. They have stood the test. But, although the choicest examples of the past are nobly housed and cared for, we are, as a nation, in no mind to divert a clerk or a salesman from a trade in order that from the strangeness of his gifts he may evolve anything more elusive than a row of figures or more logical than a bargain which we can understand. We believe in the things that have been accomplished. Those things that are problematical, difficult, and unlikely we set aside. Progress is a by-product, not a marketable commodity. We believe in it as we believe in dreams and fairies, totally unconscious of the wastage of talent and power which we have never learned how to use to the best advantage. The historian ranges over this field, reflecting how great cities absorb men and things, with some dim consciousness of a supply always forthcoming from the open. He hardly stays to consider conditions in the country and outlying districts, and remote seafaring and agricultural areas. That these yield new blood and fresh energies by adaptation to urban requirements is assumed in advance.

But what the actual conditions are under which this replenishment is made possible might undergo examination. They certainly do not remain unaffected by change; for the countryside is thrown open by motor traffic and flooded with newspapers. Everywhere along the seaboard the towns compete for popularity. and their rapidly extending suburbs encroach on the land and drive the native cottagers away. Corn gives place to golf, the fisherman and his antiquated tackle are banished from the beach. This pressure of cities increases year by year, altering in a thousand ways everything which it touches, introducing new values and improvements that may conceivably destroy more than they can make good. A land of holiday and sport, of apartment houses and week-end cottages, bears, indeed, very little resemblance to that upon which we have been accustomed to think the yeoman and the craftsman lived. For this is no longer a reservoir of strength and beauty, whatever may once have been the case.

Traditional handicrafts are therefore in steep decline. They perish as agriculture becomes more a business and less a vocation, and they are undermined also by half-educated urban ideas expressed in terms of "Ye Olde Craft Shoppe," which ministers to a paltry taste for ingle nooks, spindle-back chairs, and warming-pans. The shades of William Morris and Rossetti might well be abashed at our complete absence of volition in the arts, just as we ourselves might regard nearly all we see as a denial of what is serious and essential in the sense that a horseshoe or the structure of a barn have been serious and essential.

Conditions arising from large movements and popular causes, if simple as a spectacle, are exceedingly difficult to see in proper proportion and to use. Unspoiled minds and eyes, natural sensations of beauty and utility, are material which we have no warrant for, though they exist still. It might almost be said that no outward conditions have more to do with the arts in general than any single opinion beyond his own has to do with the work of a craftsman at any time. Yet amid the confusion of many contrary opinions he may suffer extinction, not because he is wrong, but because he is alone. Popular opinion does not connect art with life, hand craft with vocation; they are upon approva as goods from a store, only more costly. An in among ideas about art there is mixed suspicion that it invites charitable motives an needs help, a detrimental suspicion fostered b the folly of artists themselves.

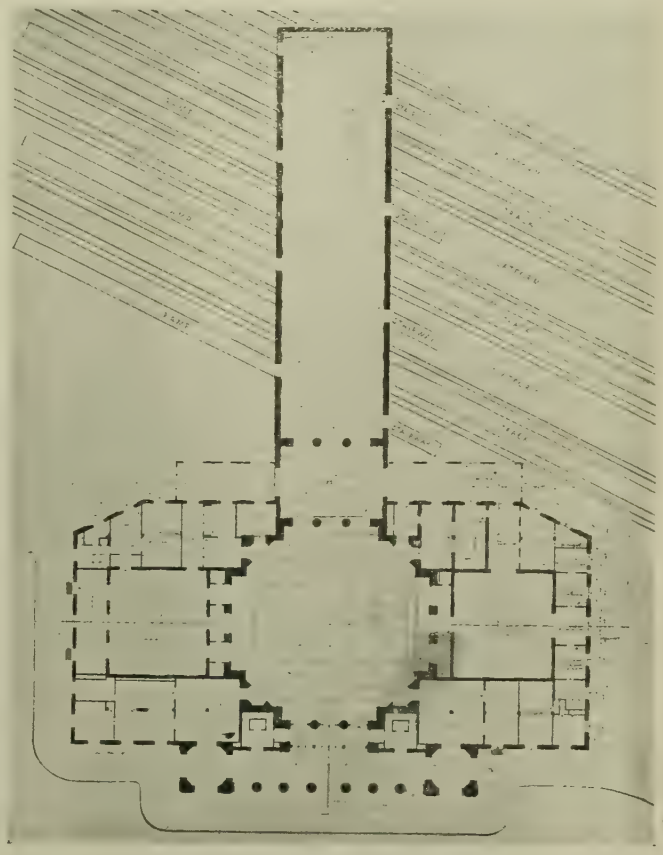
Whatever mistakes have been made abou regaining lost arts, imitating old example compromising and bargaining upon any plan but his own, the artist must realise and unit his widely scattered forces, and bring to bea those powers of construction with which he endowed in setting his own house in orde It is not enough to fall in with popular errors they will yield him nothing but discourage ment. His academies and pseudo-learned so cieties, his whole sphere of professional in terest and advancement, so long as they are narrow preserve, will favour the artificial an the theoretic, and fail to grapple with tha larger call for freedom and security, for man liness and vitality, that becomes more an more insistent.

Various industries, and separate workshop for weaving, pottery, and other handicrafts and the successful women's institutes estab lished in country towns, prove that there is nucleus both of artistic energy and loca encouragement not as yet recognised by th official body. Many other valiant attempts t recover the spirit of place and pick up th lost connection of the arts with the land an the common people have withered before tha sterile philistinism which seems to be th accompaniment if not the logic of popula journalism and centralised shows.

It is perhaps, after all, of far more import ance in the arts that their design as a socia factor should be on a large and positive scal than that present drawbacks and past neglec should be magnified. Clearly enough the wid area of the country needs development withi some substantial and capably managed policy the centre needs its circumference. Up ti the present time our tendency has been t glorify a mere handful or remnant of me busy with their own ambitions within thei own orbit. We have admitted all sorts o dubious claims, and demanded for the resul ing mixture the attention of our own an other capitals. But times have altered now for better or worse. The young press fo ward, assailing those strongholds in which ol and middle-aged personages keep power an security for themselves. The arts have grow stuffy with the pretension of greatness an the friction of rivalry in a social and profe sional sense; but lack spirit and adventu and expansive generosity of temper. Wh may or may not be thought about the niceti of this or that method or work we can ver well afford to leave aside. As artists an craftsmen set among other men in this bus and exciting world we feel that our main co cern is rather with the means by which w can be at liberty to work and gain a livel hood. Greatness we shall in due course b glad to achieve. Meantime we cannot affo to be hindered by any arrangements mad over our heads, or in which we have no han The policy of groups and coteries effects t little in a sphere so wide, in a vocation beset. What is wanting to link up an strengthen the arts is an altogether manlie simpler community of human interests amo art workers all over the country. It wou be useless and dishonest to pretend that co ditions are not disquieting, or, on the oth hand, that there are not signs of an awake ing and quickening of a social sense in a and handicraft. The process of developme may be slow and tragic in detail, or it ma by deliberation and forethought, be hasten and simplified; but nothing less than t whole capacity is demanded to overthrow e and evil systems, and do away with th narrow individualism to which most of t distress, commonly laid at the door of an i different public, is due. For the impact of well-equipped confederacy of men and wom whose purpose is as friendly and agreeab

o say demonstrable, as beauty and fitness olour can be, is not one to examine with ndiced eye, or to be apprehensive of as h it were some unwelcome infliction. nay speak of bad conditions, because our do indeed lay the implication upon us any dull job affords a better shelter, and therefore we should sacrifice our gifts oury our desire and our faith away out ght. We may find our own environment bing or unlikely in a hundred ways, our harassing and precarious out of all pro- n to our sincerity and patience. But are the afflictions which, however they purge and try and eventually spiritualise re largely imposed by the same dull wits regard their own dullness as the true ire of human grandeur. Going by their ning, a place in a show once or twice a a line of notice in a newspaper, and the little tale of poverty, are all that any artist needs by way of sustenance. For ousand years we have listened to the d of how little is given for a great pic- or a noble book, till the legend has be- a rule, and art consents not to have any What we now have to realise is the ent futility of the dull, and that we give ng for nothing. Chelsea and Mont- asse may, for all we know, be crammed genius; we should prefer to find inde- ence at home in the little towns and es among all the various lives and scenes fortunes, which apparently Chelsea and -Parnasse have never heard of, using all implements, being workmen first, and when there is nothing else to do.

t, not to be alone, a wayfarer who pays ame tolls but has no footing or company the road, the artist must bestir himself, join hands, and claim and initiate every- e the work which he can do better than ody else can do it.



Union Station, Richmond, Va: View from the Plaza.

UNION PASSENGER STATION, RICHMOND, VA.

The dominating architectural feature of this building is a huge dome of classic proportions. Apart from the distinctiveness of this new use of a dome, Mr. John Russell Pope, the architect, has, says *The American Architect*, not gone far from the beaten path of railroad station architecture in the exterior dress of the building. The choice of scale and detail of the exterior has been very conservatively classic. The front of the building is 240 ft. long, and it is 118 ft. deep from front to rear. The material used in the exterior is Indiana limestone of the kind known as "American Travertine." The simple east and west wings are three stories high on the exterior, and on the interior courts each wing has an additional story, all of which above the ground story is used for railroad business offices. The only ornamentation on the building is that which is grouped about the large clock over the entrance portico, and the Roman panel reliefs beside the second story windows of the end pavilions of the portico.

Waiting Room, looking towards Concourse.

Plan of Main Building, Concourse, and Train Platforms.

Union Station, Richmond, Va. Mr. John Russell Pope, Architect.

BOOK REVIEWS.

The Romance of Building. By ALLEN S. WALKER. (London: George Philip & Son, Ltd. 2s. 6d. net.)

This book forms one of a series published as Philips' New Era Library. The books are designed for the general reader, and they assume little if any previous knowledge on the particular subject dealt with. The books do not profess to be encyclopædic in character; they give knowledge, but they suggest ideas. They are free from technicalities and excessive detail, the main object being to present a wide general view, emphasising in most cases the human aspect of the subjects. "The Romance of Building" is written on these lines, and is distinctly successful. It forms a pleasant relief from the usual text-book, and unquestionably the human interest which is given to the subject makes it a more intimate and fascinating study for the layman. It is obviously difficult to find a suitable analogy for everything and we cannot say that we agree entirely with the author's symbolism. The book is written with care and accuracy, and the architectural student will find it a valuable addition to read with his text-books. In Chapter XI the author sums up the duration of the three main architectural systems and we would suggest that the slow development in the beginning and the quickening of the pace in more recent times might be traced to the growth of reading, writing and travel. Similarly in the development of Gothic architecture, three hundred years may seem a comparatively short period, but to-day the possibilities of a style are exhausted in a few years. This fact seems to be important along with the value of tradition which undoubtedly was an important factor in the evolution and development of the great Gothic style.

The author mentions that Ruskin came to the conclusion that the Decorated period is to be held responsible for the decay and downfall of Gothic architecture. We think that the Renaissance, which stood for the re-birth of so many things, was responsible for the complete architectural change, quite apart from any signs of decay in the Gothic style. Incidentally, the author deals very successfully with the Renaissance period, which is generally a stumbling-block to the average layman.

The author attributes the great works of the Early English Gothic period to the religious fervour of the Crusades. The churches may have been memorials—as he suggests—but we think it is also true to say that religion or the Church had an immense hold on the people in this period and that the nation in her growing wealth at the time of the Renaissance was bound to develop, not necessarily a new architectural style, but certainly other types of buildings.

The suggestion that people do not feel reverent in a building built in the Italian style has frequently been commented upon, and in a book of this nature we had almost expected that the author might have something to say about the pagan idea often associated with Classic architecture.

We are not altogether convinced that it is wise to stress too much the various periods which go to make up the Renaissance style. The Renaissance work prior to the Anglo-Italian period is generally accepted as being purely transitional. Regarding the author's comment that he considers the Early English Gothic style for the Courts of Justice "has a severity and simplicity which befits the cold impartiality symbolical of the administration of Law," we would point out that many people hold quite the contrary opinion, maintaining that the feeling of mediævalism symbolises obsolete methods and an absence of light in the wide sense of the word. These suggestions are not put forward in a hypercritical spirit, and it may be that some of the points are merely matters of opinion.

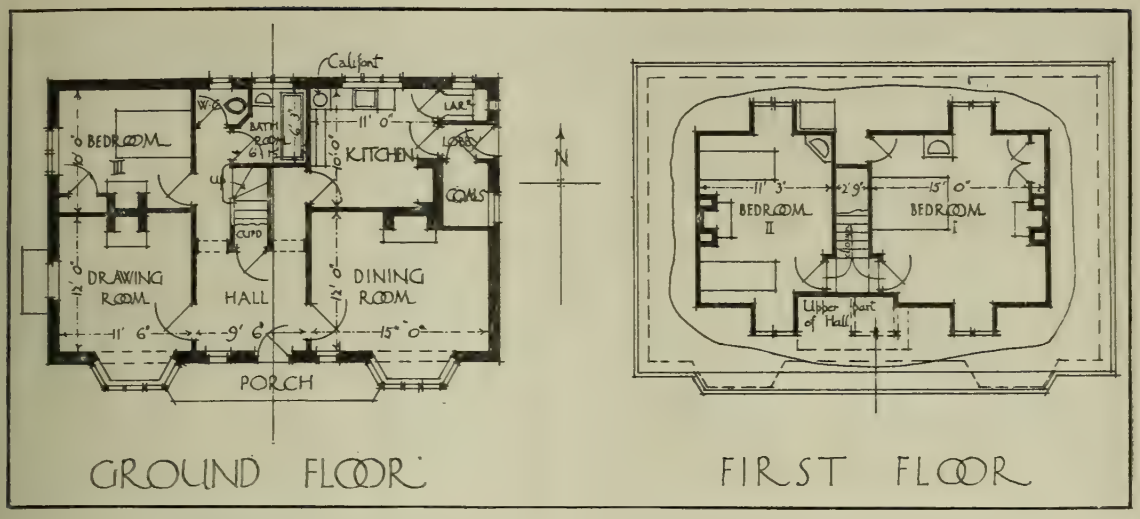
The author and publishers are to be congratulated on this book; it is an excellent contribution to the literature of architecture, and it ought to be widely read by the general public.

H.

How to Get Houses. By GEORGE HICKS. (The Trade Union Congress and Labour Party, 32, 33, 34, Eccleston-square, London, S.W. 1.) Price, 3d.

This pamphlet is free from that curious class consciousness, perhaps better described as "class pride," that characterises so many of the utterances of Labour, and that is so bewildering and even provocative to the well-disposed reader; we find a trace of it, however, in the preface, written by the General Secretary, National Federation Building Trades' Operatives, where reference is made in the most casual and matter-of-fact way to "the capitalist newspapers." Turning to the pamphlet itself, Mr. Hicks insists on the evil results of bad housing generally and ably ranges his authorities to support him. While it would be hard, one hopes, to find anyone now who is so blind as not to realise the appalling results of our bad housing conditions, nevertheless it is a st that cannot be too strongly brought h In claiming that "social needs must over in this matter the more insidious influenc class interests," Mr. Hicks is voicing the ments of all right-minded people, and we regard it as established that slum clearance be treated as a national charge, even th £200,000 a year is an utterly absurd su devote to this purpose.

The main object of the pamphlet is desc in an italicised heading as follows:—



"This pamphlet has been written to the attention of all concerned about the ho question to the fact that municipal autho owing to the reduction in costs of bui may carry out housing schemes without in ing local rates because the new rateable created will bring an average local re sufficient to cover all loss."

It is, unfortunately, not very clear, at to the average mind, what this really m If it is that new houses are to be subs as to rates by raising or artificially prolo the life of existing recent assessments apparently increased value, a value tha in fact, in the overwhelming majority of been prevented by Act of Parliament coming into economic play, existing rate must clearly bear an extra burden, due t erection of new houses. Rates on ex houses may not actually be "increased," the effect is to make the ratepayer pay m rates than he would have to pay if new h were not erected, this can only be regard increase in rates, since it either preve reduction, or it means that rates are bas a higher assessment. As regards Mr. H figures, even if we accept the basis of h estimate of outgoings and management, hard to see how he can reasonably consid rates on new houses as *net* incomings w making any allowance for the expense o services, even taking these on a reduced That adequate housing ultimately mean economy both in rates and taxes is, opinion, indisputable, since increased cc ment and better health must save im sums in remedial measures and produce same time an increased output and interest and consequent value in the work

Measures of assistance are, unfortu unavoidable at the present moment, but not hold that any palliative contains ti mate solution. Such a solution can o sought in the power of industry to pay that shall enable its employees to m

Town-Planning Review: *The Quarterly ournal of the Department of Civic Design t the School of Architecture at the University f Liverpool.* Vol. X No. 2. (Liverpool: he University Press, Ltd.) (London: Iodder & Stoughton.) 15s. per annum, ost free.

s *Review* stands conspicuous as an example cellence, not only in its contents, but in ng and production generally. The out- ng feature of this issue is an article rofessor Patrick Abercrombie on Wren's for London after the Great Fire, and gh we may have been rather flooded with literature of late, yet an essay of this kind, ning a critical analysis of Wren's scheme producing plans of London, both as pro- and as realised, should be of value as a nent work of reference in any library. contributions include an article on rial development by Mr. V. M. Christy, survey of the development of the town by; a paper by Professor S. D. Adshead d "Imagination in Town Planning," in an appeal is made for a little more m in everyday life and its setting; and s by Mr. Christopher Dawson and Mr. Ramsey. The strength of the pro- centres and the great possibilities that ld are well illustrated in such periodicals *Town-Planning Review*, and we are con- hat public apathy will slowly but surely come by a movement that is constantly ing in vigour and influence.

Books on Old Furniture. 1, *Tudor to art.* 2, *Queen Anne.* By J. P. BLAKE l H. E. REVEIRS-HOPKINS. (London: inemann.) 4s. 6d. each net.

e little books are written in a lucid and manner, and so will appeal to the person s a genuine love for old pieces. The opens with a chapter on making a n, and contains many useful hints and ound advice. Quite rightly the authors t the lesser pieces coming from the old nd smaller houses, if not so elaborate, s much historical interest as the more e and much-sought-for pieces. In addi- might be added, these lesser pieces are less be tampered with than the show pieces.

Many a country-made Queen Anne chair, chest or bureau possesses all the pleasing lines and matured colouring of a more aristocratic specimen. Again, these lesser pieces are the most utilitarian. It is the student and genuine lover of the antique who get the real pleasure from their finds, even if their purses are light, whereas the wealthy person can command most things he may desire without the pleasure of the quest, so it is to him that these little volumes will appeal. The one dealing with the Stuart period treats fully, yet simply, with the many oak pieces of that age, and gives numerous illustrations of characteristic examples, some from private collections which are inaccessible to many, others from the Victoria and Albert Museum. In addition a useful table of dates is given, commencing from 1485 to 1688, which embraces the period dealt with.

The second volume, the Queen Anne period, is treated in a similarly interesting manner. To many this period has its attractions, and not without good reason, for the chairs, settees and tables with their beautiful lines and quiet dignity are particularly attractive, especially those possessing the claw and ball foot, and for these prices are high. The chairs are certainly the most comfortable, and on them the modern manufacturer bases much of the present-day furniture, and the bureau of to-day remains practically the same as in the days of Queen Anne—that is, as far as design is concerned. The volumes make an interesting addition to the collector's bookcase.

English Furniture Designs. By P. T. HILDESLEY. (London: Benn Bros.) 18s. net.

This volume contains 87 designs and scale drawings for modern furniture, with a foreword by Mr. H. P. Shapland, A.R.I.B.A. Included in this number are designs for the decoration and furnishing of various interiors. The book will be welcomed by modern craftsmen and furniture manufacturers, who at the present time do not receive the encouragement they should to produce fine furniture, the craze for the antique being so great. Signs of abatement in this direction, however, are becoming apparent and every inducement should be given them to produce well-proportioned and soundly-constructed pieces at a reasonable price. The present being an age of machinery, no craftsman can compete with mass production, but designer and manufacturer, in co-operation, should obtain good results, and it is here that this volume will be of service. Preference may be given to the simpler specimens such as the mahogany sideboards on pages 6 and 8, gentleman's wardrobe page 24, and small china cabinet page 32. The volume is the work of an experienced man who has drawn all the pieces to scale, with full-size details, making it of practical value to both manufacturer and amateur.

Marine Works. By ERNEST LATHAM, M.Inst. C.E. (London: Crosby Lockwood & Son.) Price 16s. net.

This little volume of 174 pages, comprises information useful to civil engineers when undertaking maritime work. As stated by the author in his preface, he has availed himself of excellent articles already produced in reliable publications, adding thereto examples that have come under his notice, and giving us the advantage of his views and experiences therein. A preface written by Mr. C. L. Maistre, C.B.E., Secretary of the British Engineering Standards Association, draws attention to the author's view of continuity of power, and in the case of tidal action to the fallacy of trying to obtain simultaneously power as well as navigation. The author's distinction between the studies of a civil and an electrical engineer are also described. To show the completeness of the volume, it may be mentioned that the author deals with the formation, action and effect of waves, the salvage of marine works, the maintenance of tidal berths, pile-driving and its records, the conservancy of marsh lands, groynes and coast defences, with an explanation of the use, under special circumstances, of stockade fences and of stud groynes. Other chapters relate to the structural problems on navigable rivers, the action of scour upon a foreshore and the construction of deep water quays. The letterpress is well compiled and the illustrations very clear and sufficient. An appendix of selected legal aspects of maritime engineering is added, and a comprehensive index enables any desired detail connected with the above list to be referred to by the reader.

"MARVEN" BEACONSFIELD.

THIS house or bungalow was built in 1921. Having one bedroom on the ground floor, the staircase was so planned as to give privacy of approach from this and the first-floor bedrooms to the bathroom and w.c., whilst the hall and living rooms are well separated from the bedrooms and kitchen premises. The planning of bathroom and kitchen sink gives a simple arrangement of drainage. Hot water is supplied by a "Califont" in the kitchen. The landing outside bedroom doors has an open handrail and balusters, giving the effect of a small gallery looking down into the hall. The house is built with cavity walls faced with red bricks of varied colour, and the roof is covered with hand-made tiles.

The architects were Messrs. Burgess, Holden & Watson, of 13, Gray's Inn square, W.C.1, and Beaconsfield, and the contractors Messrs. Y. J. Lovell & Son, of 6, Bathurst-street, W., and Beaconsfield.

HOUSING CONDITIONS IN BRUSSELS AND SUBURBS.

BRUSSELS, we are informed, is showing the same phenomena as other large towns with regard to its population and their abodes, the centre of the town (Brussels commune) showing, during the ten years 1910–1920, a loss of inhabitants of no fewer than 22,000; while since 1900 it has lost 28,885 inhabitants. The cause of this movement of the population is the same as elsewhere. The houses in the centre of the town have become too expensive to be used as dwellings, and families have moved out to make room for commercial houses which use the premises for offices.

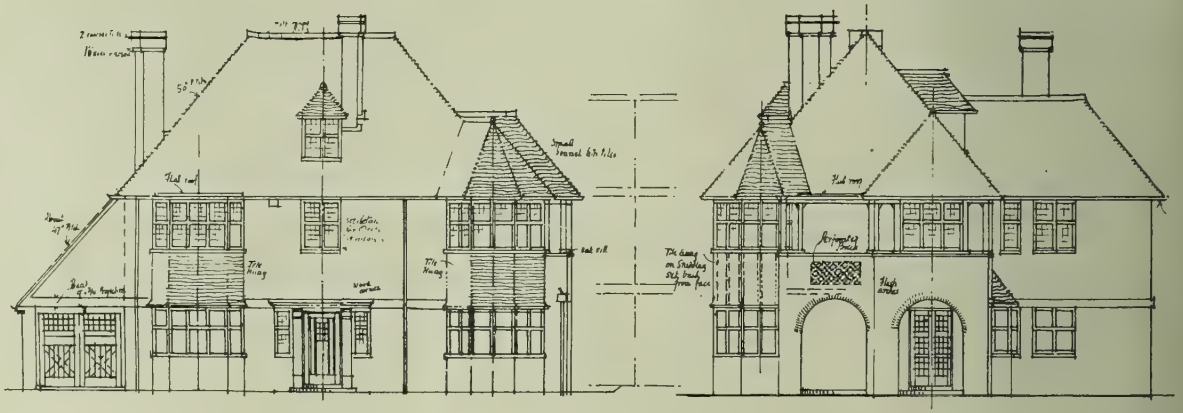
This explains how it is that, in some districts, the population has not increased, and there is, really, no dwelling house shortage; in fact, the demand for rooms has enabled some people, who benefit from the Rent Restriction Act, to actually improve their situation by partial sub-letting.

In greater Brussels the number of houses increased, from 1910 to 1920, by 6.35 per cent., and the number of families living separately, in the same period, by 13.49 per cent., though the population itself increased by only 4.37 per cent. The number of families per house was 242 for every 100 houses in 1910 and 258 per 100 houses in 1920.

In Brussels town figures show opposite tendencies, for, though the number of houses has diminished, the proportion of persons living in them has diminished still more (by 7.73 per cent.).

In greater Brussels the number of insufficient lodgings (more than one person per room) have slightly increased. In 1910, there were 74,402 such lodgings with 314,287 occupants, making 43 per cent of the population. Now 74,826 families are inadequately housed.

In Brussels town, on the contrary, there are 2,000 fewer families insufficiently housed than there were in 1910, but the figure is still high, reaching 42 per cent. of the population, a percentage only exceeded in the Koekelberg commune, where 50 per cent. of the population is underhoused.



In all these figures, allowance must be made for the fact that, in these last years, all sorts of rooms, attics, out-houses and basements, have been included which, in former times, were not considered as habitable at all. It is, there rather rash to presume that the numbe rooms used by 100 persons is really more it used to be.

Another conclusion which appears from statistics is that smaller houses are much overcrowded than previously. Taking the area of greater Brussels, two-thirds of dwellings consist of one, two, or three ro and two-thirds of the population live in restricted surroundings. In the commun Molenbeek, Anderlecht, Koekelberg and Bru these proportions are surpassed, two-thirds population living in apartments of less four rooms. It is in these small flats that crowding is at its worst.

Here again there is a noticeable diffe between the central quarters, where crowding is the least, and the poorer dist The further away they are from the centre more do the districts receive an influx of families. Here also are to be found the wo and lower middle classes. It is in these subu localities that the housing crisis is at its and where its effect is most disastrous. Y families are obliged to live in conditions of crowding which must have effect on the h of the nation.

THE BUILDING TRADE.

THE TRADE UNION CONGRESS.

E Trade Union Congress which opened lymouth last week, is the fifty-fifth. It enty-four years since the Congress met at outh, representing a membership of some ,000, and that meeting marked the birth e political Labour Party. According to President's address, on the present occasion were 702 delegates, representing a member- of 4,369,000.

e President voiced that desire for peace h is present in every mind at the moment; there is little to be gained by advocating disarmament of one nation, and that our when a spirit of aggression is still abroad. ginning, however, could well be made by e at home in industrial matters, and we are to note that the President advocated liatory methods and arbitration in this ection.

e agenda was a peculiarly barren one, the resolution of the National Union of vaymen, advocating a six-hour working day, either be ironical or the unions are shutting eyes to the condition of the world. Our petitors abroad are working unlimited s to repair the ravages of the war, and it e for any one in this country to think that is the time for a leisured existence. We our own devastations to make good and competition to face, and this is no time lacking.

ere is very little that calls for any special nent in the proceedings of the Congress year, unless it be the absence of any prac- contribution towards the solution of the lems of the day. On the question of unem- ment, for instance, the resolution moved on sday last week only expressed dissatisfac- with the plans of the Government for ng with unemployment, and called upon Government to promote practical schemes ublic utility on a national scale as an alter- e to the vast expenditure of public money employment benefit and to provide a contri- n from State funds to heavily-rated cts towards unemployment relief.

solutions such as these are passed by the ress in a few minutes and arouse no dis- n, and they, therefore, are of no value. The ion as to how to provide relief combined work has exercised the Government for time, and it will be remembered that, in ction with unemployment benefit, a et Committee early in the year reluctantly mpelled to report that it was impracticable ply those funds in the provision of work. *The Builder*, March 9, 1923.) If the provi- f work was made a condition of relief from ates, the Congress would be the first to e that this was a retrograde movement ring of the principles associated with the ouse, and an outcry would be made. The unions are fully alive to the danger of ised industry competing with unsubsidised , and are aware of all the difficulties ed in putting the resolution they have into operation, but to move a general ion censuring the Government is a safe , whilst to devise or suggest any practical would involve offending the prejudices inions of many members, so the easier is adopted and the subject is dismissed practical suggestions on the part of the es of Congress towards the solution of tion which is of such difficulty that any al suggestions would be welcome.

n connected with this question of unem- nt and relief, there is the point, recently t prominently before the public, that nemployment and the necessity for relief en accentuated by insubordination in the and domestic questions between unions. was reported in the same paper that recorded the proceedings of the Congress that the unauthorised strike in the docks had caused the West Ham Guardians to pay £45,000 in relief; but, although some questions between unions were the subject of some rather acrimonious discussion at the Congress, the public must be disappointed that no serious attempt was made to deal with the co-ordination of unions, so as to give some lead as to how such profitless jealousies might be avoided in future, and obstacles to employment raised by disputes between the unions be removed. The fact is that greater ability is displayed at the Congress on purely political questions, with which we are not concerned in these pages, than in connection with the industrial questions of the day. This being the case, our notice of the proceedings of Congress must be somewhat critical, although we do not ignore the eloquence displayed and the higher level reached when political subjects are under discussion.

In connection with our observations above, it may be noted that a resolution, much on the same lines as that introduced last year, was again brought forward requiring affiliated unions to keep the General Council informed as to matters arising between unions and employers, and also between unions, particularly where large bodies of workmen were involved, and where negotiations broke down or a deadlock threatened to give the General Council the initiative to call a conference and tender advice. If such advice were adopted and the employers forced a stoppage, then the General Council "should organise all such moral and material support as the circumstances of the dispute might appear to justify." This resolution also required differences between unions to be submitted to the final Council for adjustment. It was, however, negatived by a large majority, and this to some extent explains the inability of the Congress to grapple with the questions arising recently between unions.

On the last day but one of the Congress two important resolutions were introduced, one relating to unemployed insurance by industries and the other to co-partnership schemes. The Congress was invited to declare that insurance by industries was inequitable and anti-social, and that unemployment insurance should be general, mutual and national; but the Congress took the statesmanlike course of subjecting the question to an inquiry by the General Council. As regards co-partnership, the same course appears to have been adopted. A resolution was moved which declared that co-partnership schemes were designed to mislead the workers and prevent trade union solidarity. The mover of this resolution frankly stated that the object of capitalist co-partnership was to increase production, but it undermined the loyalty of the worker to his union. These arguments were used in the Lever case, but the figures as to the profits made by the men showed that co-partnership was certainly to their advantage, and the other arguments that it increases production and tends to peaceful relations with employers can hardly be taken as conclusive against the system. As the crying needs of the time are increased production and industrial peace, the mover of the resolution appears rather to have strengthened the case for co-partnership than to have destroyed it. The proceedings are, however, shortly reported, and both the resolution and the addendum recommending a reference to the General Council appear to have been carried.

A resolution was carried instructing the General Council to promote a Bill to establish an eight-hour day and a 48-hour week. This has to be noted in connection with the unlimited hours being worked on the Continent by our competitors in trade, and before we have in the least recovered from a devastating war, and a sufficient comment was provided by a resolution moved by Mr. C. T. Cramp, of the National Union of Railwaymen, that the time has arrived when a six-hour day should be demanded. It would, indeed, be interesting to know on what particular signs of the times the Railwaymen's Union base this contention. If production is to be retarded and working hours to be limited to six hours, it will soon be hard to distinguish between the employed and the unemployed, and certainly all relief measures will perforce come to an end for want of funds. The resolution in question appears, however, only to have been moved as an amendment to the eight-hour resolution, and, of course, it was not carried as its mover was so candid as to admit that it was incapable of immediate translation into effect.

An interesting point was raised on the question as to whether the voluntary agreements of Joint Industrial Councils should be given legal effect. The General Council had left this point for the decision of the Congress, but a sub-committee had recommended the adoption of a Bill promoted by the Association of Joint Industrial Councils which provides that the agreements registered by the Minister of Labour should be legally enforceable at law, with the proviso, however, added that the Whitley Council should represent 75 per cent. of the industry concerned and that the responsibility for taking proceedings against employers violating a registered agreement should be taken by and at the expense of the Ministry. The recommendations of the sub-committee were rejected by the Congress and the discussion was interesting. There was some weight in the argument of Mr. Robinson that to legalise voluntary agreements might be hazardous, and employers might secede from the Councils to prevent the 75 per cent. principle from applying, and, in any case, it would not be easy to get the Ministry to undertake proceedings; but some of the speakers used two-edged arguments, as, for instance, that if agreements were made enforceable there would be no further inducement to men to join the unions. After all, the trade unions exist for the general benefit of the members and to shape a policy favourable for them, but some trade unionists overlook this and consider that the men only exist for the unions.

A very important resolution related to the identification of the supervisory and technical staff, foremen and others with the unions. There was considerable discussion, but the resolution was finally adopted. This is a very serious question, but only one speaker, according to the report, recognised that they were asking these men to serve two masters at the same time, whilst the argument that the co-operation of the supervisory grades would be essential to the workers' control of industry seems a little premature at the present time.

A resolution was also carried disapproving the recommendations of the Cave Committee on Trade Boards.

It will be seen from this brief notice that the Congress covered some ground in its deliberations and raised some very interesting questions, and thus showed an advance on pre-war congresses, which often merely moved stereotyped resolutions year in and year out. There is every reason to expect that in the future the same advance will be shown in the treatment of industrial questions as is already apparent in the political side since Labour has been more represented in Parliament and its members have gained in breadth and experience.

Thorneycroft House.

The sculptor of the panel at Thorneycroft House, Westminster, illustrated in *The Builder* last week, was Mr. E. S. Frith, of Elgin Studio, Trafalgar-square, Chelsea, S.W. 3.

APPRENTICES IN THE BUILDING TRADE.

Mr. F. J. GAYER, Past President of the London Master Builders' Association, writes:—

SIR,—In the midst of an unparalleled state of unemployment in industry generally it is interesting to note that there is quite an appreciable volume of building work available, but unfortunately the amount of skilled labour is totally inadequate. In fact, it has been foreseen for some time that the number of skilled building trade workers is such that can only cope with a slump, and there are not sufficient to cope with a normal demand, much less than a boom, such as could be rightly looked for following the depression and the only partly diminished demand for houses.

The peculiar position is such that naturally invites attention to the cause and remedy. The shortage to a small extent can be attributed to the war, it being easy to understand that the building trade is no exception to the consequent chaos. The other reason is obviously the lack of new blood, since the only entry is at present by means of apprenticeship.

All are agreed that the best method of augmentation of labour is by the apprenticeship scheme, and at first blush one is naturally inclined to ask, if this is agreed, why not carry on and so solve the problem. It must be recognised that the building trade is exceptional. The extent of the ebb and flow of the volume of work is probably more marked in this than in any other industry, with its consequential losses not only to the operative but to the employer. The existing apprenticeship schemes provide for guaranteed continuity of labour for the apprentice until he is 21 years of age; and while many of the employers can face the risk of guaranteeing employment by means of apprenticeship to a limited number, yet quite a large number of apprentices are not taken because the employer, owing to the casual nature of the industry, is not in a position to guarantee continuity of employment to the full quota.

It is also undoubtedly a fact that the trade unions view the shortage of labour as an asset to their bargaining powers, in lieu of taking a wider view of the benefit of increasing their ranks to more adequately fit the demands. If the unions could be persuaded to vary the apprenticeship scheme to recognise the following suggestions, much of the shortage would disappear. The unions would really be in a healthier position, the community in general would gain, and much of the demoralising influence of the dole would disappear.

The apprenticeship scheme should by mutual consent be modified to provide that in the event of any employer being unable to find sufficient employment for his apprentices, they should stand off until such time as they can be restarted, in a like manner to that in which the craftsmen are stood off. Where, by the misfortune of slackness of trade, the craftsmen are stood off, it seems illogical and even unfair to the craftsmen to be stood off while the proportion of apprentices to craftsmen consequently increases. Further, there are many trade union labourers used to building work who could, quite reasonably, by training with the help of the craft unions, perform many of the simpler craft operations.

The more highly-skilled craftsmen would have nothing to fear from this augmentation of labour, since, in the event of a falling-off in employment, the builder obviously and naturally retains his best men. Much more consideration might be reasonably given by the employers and unions to an endeavour to regulate the volume of building work with a view to levelling up the valleys of depression and levelling down the hills of booms, &c., and so to some extent guard against unemployment on the one hand and high costs on the other. It can reasonably be anticipated that for the next few years there will be sufficient building work to more than absorb the available skilled labour, hence action is required promptly to devise a scheme that will transfer many of the unemployed to the ranks of useful producers.

No doubt it is very tempting to the operatives to maintain a shortage in their ranks in order to draw rates higher than the standard from the unscrupulous unfederated builder; but it must not be lost sight of that these unfederated builders pay less than standard rates when trade is adverse.

Even under current conditions enquiry will show that certain unfederated builders are paying higher rates to bricklayers, carpenters and plasterers because of the shortage, and paying on the same jobs lower than standard rates to painters and labourers owing to a sufficienty of this type of labour.

PAYMENT BY RESULTS IN THE BUILDING INDUSTRY.

IN the last issue of *The Builder* we gave a letter to *The Times* from Mr. Roland B. Chessum, Past President of the London Master Builders' Association, supporting the principle of payment by results in British industry with the object of securing a boom in trade. Sir Edwin Stockton, M.P., discusses the subject in a letter in *The Times* on Monday. He writes:—

"Absence from home on a brief holiday must explain the delay on my part in sending you a very short note expressing the approval which many employers must feel with regard to the able and interesting articles you recently published by Mr. P. J. Pybus on payment by results.

"To my mind, the difficulty in giving effect to his suggestion that district appeal tribunals might be established by the State and given statutory authority to deal with charges of rate cutting and evasions of wage bargains—thereby increasing confidence in this method of working—lies in the obvious fact that it would be impossible to enforce resort to them. If you are intending to establish them in order that the well-disposed might profit by their existence, then it seems to me that an educational campaign should precede their creation. More harm than good would be done by establishing tribunals of this nature, whose operations would be largely sterilised by hostility or indifference. On the other hand, if we are to make a beginning, then I can well imagine that such an effort would be most advantageously attempted in those trades where unemployment is less pronounced and where craft workmanship predominates. It seems to me most unlikely—to use no stronger term—that much can be hoped from industrial unionism at the pres time, not merely because this is especia affected by economic depression, but beca though its aim and object may be for hig wages and better conditions of work, there not shared by all the members of any dustrial union the same hope of relative provement in their common prospects wh might be realised by craft workers deciding test the advantages of payment by results. rather agree with Mr. Pybus, as I read articles, that industrial unionism shows t dencies of progress in the direction of Syn calism—the control of the industry for benefit of the workers by the workers. So may call it progress towards nationalisati we will not bother about the exact designati Under these circumstances you will have more difficulty in converting industrial union to the payment by results system than you the craft unions, which can easily see, if t wish, personal benefits of a very tangible nat

"Personally, I am not altogether enamou of the idea of State intervention in the mat I am not sure that the desired result could be achieved by voluntary action, the more s any beginning must be on a relatively restric scale. Afterwards, when progress was recor then the State might intervene, or at least might discuss the value of such intervention.

"For the present we have to combat the doubted industrial tendencies to preach supposed superlative advantages of wage equa spread over the widest area. We have to sh that this ultimately means disaster in markets of the world, unless there is the centive of maximum efficient output. And o an educational campaign will effect a w understanding of this by the workers."

BUILDING MATERIAL PRICES.

The third interim report of the In Departmental Committee which is conside the prices of building materials has just issued, and is signed by the Chairman, Halford J. Mackinder. The report, w covers the month of August, states:—

Since July, there have been only a few changes. In the case of timber, t has been an advance of £2 per standar Birmingham, while the special purchase the London County Council for their hou schemes have been made at an increas £4 per standard over those made in the pre month. Apart from these, there are no preciable changes, either in any particular or class of material, to which attention be drawn.

Shop front in Balham-hill, S.W. MR. ELFRIC H. SMITH, Architect.

[The old front of this shop was entirely removed and a lobby formed with new windo The showcases are in Japanese oak; backs and floors of windows and cases are in sycamore with egg-shell finish; lead lights to stall-boards in dove grey marble with gl tile name panels; panels over windows filled in with blue and white Dutch tiles.

ESTIMATING FOR SMALL BUILDERS.—VI.

By J. H. BARNS, F.I.O.B.

STONE MASON.

It is hardly likely that the small builder in the London district will run his own mason's yard, and more likely that he will arrange for such work to be done by some local firm of stone masons. In the event of an estimate being required for stonework, he would obtain a figure from the masons, add on for scaffolding, "on-costs," and profit. It is necessary that a small builder should have some idea of the value of worked stonework, and the various items which go to make up the total cost.

As each job may vary considerably, it is impossible to state a general figure to meet all contingencies. An attempt will be made to give some idea of the value of stonework by the following examples:—It is usual for stonework to be bought at a price per foot cube inclusive of labour and materials. Considerations of space will not allow more than four items of worked stone being taken, but these as far as they go should prove helpful. Without seriously considering the subject, many would think that a large moulded cornice would be worth more per ft. cube than a little plain step, whereas the reverse is the case. The price per cu. ft. of worked stone will largely depend upon the amount of labour on the stone. It may be taken quite generally that the smaller the stones the more expensive they will be per ft. cube, as in the large stones there is a greater measure of cubic feet over which to spread the cost of labour, and therefore the larger stones will work out at a cheaper rate per cubic foot. This can easily be seen from the examples taken, that a 12 in. by 6 in. rubbed Portland stone threshold would work out cheaper at current rates than a 9 in. by 4 in. threshold similarly worked. A similar result is shown in the case of a weathered and moulded cornice where the 24 in. by 12 in. section comes out at 15s. 10d. per ft. cube, and the 12 in. by 6 in. section totals 21s. 3d.

Although the current market rates are stated it is necessary that they should be verified in every case, as each job usually has some circumstance likely to affect the price.

The rates for labour stated are in the main for machine work. The "bed" includes the preliminary labour of half sawing and the truing up. The "back" is at a lower rate, as it is unlikely that any truing up would be required. Sometimes the back is left rough, resulting in a saving of labour and material. The sunk face to weathering rate includes cost half sawing and cost of weathering by machine. The moulded face stated is the girt of the moulding and price includes the preliminary labours. In the cost of mortar is included an amount for the small quantity of Portland cement often used for grouting in, to form joggle joints. This practice is sometimes objected to as it tends to stain the stonework. To obviate this, white cement is sometimes used at a cost of about 2d. per ft. cube additional. In the cost of stone is included the cost of the block delivered to the railway station and transport to mason's yard for working, and waste consequent upon sawing to size. Cartage from mason's yard to job is stated separately. Price of block stone can be seen each week in *The Builder* list of prices.

		Add profit and on-costs, 15 per cent.		3	0
		Per cu. ft.	1	2	6

The plain rubbed face to top and front of step would be worked by machine, and the ends by hand labour. The cost of scaffolding will, of course, vary greatly, as in most cases some arrangement must be made for the rolling tackle. It is not unusual for an all-round price to be quoted for the stonework of a particular job, which would probably be arrived at by averaging the value of the masonry, as some portions may figure out at a much higher price than the examples taken. Although two examples are given of worked stone and called threshold, one can easily imagine a similar stone worked another way up and termed

ashlar, seen two or four faces, in which case the cost would be about the same.

A fair all-round price for an average Portland stone job, fixed complete, would be about 20s. per ft. cube, to which must be added scaffolding, &c.

Price is for Whitbed stone laid on its natural bed. This is always particularly specified to be done, as there is no doubt that the stone weathers much better, but sometimes mistakes occur and stones are not properly bedded.

It is, therefore, essential for the small builder to get some little knowledge of the bed of stone if he is to give proper satisfaction to his customer.

The price for box ground Bath stone would be arrived at in a similar manner to that indicated above, except that it would be worth about 40 per cent. less, except for fixing, mortar and scaffolding, which items would probably cost about the same.

In the case of some of these stones it is considered necessary to coat the outside face with some preservative to protect the material against the acids present in the London atmosphere. Some of these are considered so to harden the face that they prevent any moisture in the stone from drying out and may cause scabbing or erosion. The cost of protective treatment varies considerably, and may be roughly stated at from 4d. to 1s. per yard super of surface treated.

YORK STONE.

There are many districts quarrying this material, and some kinds of the stone are very much harder than others and, therefore, more expensive and more costly to work. Presuming the block stone cost about the same as Portland, the labours (if worked in London) would cost about 10 per cent. more, with exception of fixing, &c. In the case of plain steps, &c., the preparation is usually worked at the quarries where the sawing, &c., can be done for about 50 per cent. less than the rates quoted for London prepared stone. It is therefore advisable, where the size of the job will permit of it, to get ordinary Yorkshire stone items direct from the quarries, worked to the required dimensions.

A 12 in. by 3 in. hard York threshold, rubbed top and front edge, would be worth about 12s. 6d. per ft. cube delivered, or 3s. 2d. ft. run.

12 in. by 4 in. ditto, at 12s. per ft. cube, 4s. ft. run.

12 in. by 6 in. ditto, at 11s. per ft. cube, 5s. 6d. ft. run.

Harder York stone, say equal to "Silex" brand, would cost about 21s. ft. cube delivered.

If steps sawn instead of rubbed, deduct 4d. ft. sup. for each face.

Example :—

— ft. run 12 in. by 6 in. hard York stone threshold rubbed top and front edge.

	s.	d.
1 ft. run stone	5	6
Mortar, &c.		3
Labour, say 1s. 6d. ft. cube		9
	6	6
Add profit and on-costs 15 per cent.	1	0
	7	6

Quarry worked York stone, sunk weathered throated and grooved window sills, would cost about 18s. ft. cube delivered on job, and fixing is worth about 1s. 6d. ft. cube.

TOOLED YORK STONE TEMPLATES.

3 in. templates tooled on top are worth about 1s. 9d. per ft. super. (delivered) cut to sizes, with the addition of 5d. per ft. run for tooling edges.

6 in. templates cost 3s. 6d. per ft. super, and tooled edges 9d. per ft. run. York stone of a harder description would cost about 2s. 4d. per ft. super for 3 in., and 4s. 6d. per ft. super for 6 in.

York templates tooled on top.

	s.	d.	
9″ × 9″ × 3″	1	2	each.

	10	10
Add profit and on-costs .. 15 per cent.	1	8
	12	6

GRANOLITHIC OR ARTIFICIAL STONEWORK.

This is usually made of crushed granite and Portland cement either by wet mixing or some semi-dry process, placed into a mould and pressed. The former seems to give much the better result but is slightly dearer. It is often prepared by specialists although there is no difficulty in the matter provided there are the necessary skill and attention used in its preparation. Prices will, of course, vary with the quantity and quality of the work, but the following are for fair average quality pre-cast work delivered on to job :—

	per ft. run.
9″ × 3″ sunk weathered throated and grooved window sills including fair ends	2/–
9″ × 6″ ditto	3/3
14″ × 3″ weathered and twice throated coping	2/3
12″ × 3″ plain steps	2/3
12″ × 3″ moulded steps	2/6
12″ × 6″ plain steps	4/–
12″ × 6″ moulded steps	4/6

Moulded steps for fireproof staircases would be about 14 in. by 9 in. precast with steel reinforcement, and to a spandril shape with square wall hold one end and with moulded return the other end and two baluster holes cast in. The top of tread either to be grooved or sprinkled with carborundum to prevent slipping.

Cost per ft. run about 4/–.

Example :—

— ft. run 9″ × 6″ step sunk weathered throated and grooved granolithic window sills, including fair ends.

	s.	d.
1 ft. run 9″ × 6″	3	3
Cement, &c.		2
Labour fixing, say at 1/6 per ft. cu.		7
	4	0
Add profit and on-costs—15 per cent.		7
	4	7

— ft. run 14″ × 9″ moulded steps for fireproof staircase all as above.

	s.	d.
1 ft. run 14″ × 9″	4	0
Cement, &c.		2
Labour fixing, 1/6 per ft. cu.	1	4
	5	6
Add profit and on-costs—15 per cent.		10
	6	4

4″ granolithic precast landings, 4/– per ft. sup.

It is much better to cast these landings *in situ* as the precast landings are very difficult to fix, being heavy and awkward to handle on a staircase. The landing step or front part of the landing can be precast to match the other steps, and the rest of the landing can be cast *in situ*, or, to put the matter another way, can be concreted with a concrete formed of crushed granite containing the necessary reinforcement for its support. Granolithic stonework can be precast for architectural dressings to any design; the cost would be about equal to Bath stone.

Grano paving 1″ thick, per yd. 3/– to 3/6
,, ,, 1½″ ,, ,, 3/6 to 4/–
,, ,, 2″ ,, ,, 4/6 to 5/–

ASPHALTE.

	per yd. super.
½ in. thick damp-proof course	4/–
¾ in. paving in one layer	5/3 to 6/3
1 in. ,, ,, ,, ,,	6/3 to 7/–
¾ in. paving in two layers in roof	5/9 to 6/9
1 in. ,, ,, ,, ,, ,,	6/9 to 8/–
¾ in. vertical rendering to walls	8/3 to 9/6
Extra labour to outlets to roof	2/– each.
Extra labour forming channel in flats	6d. each.
Asphalte skirting, 6 in. high, tucked into brickwork at top and with angle fillet at bottom	10d. to 1/– per ft. run.
Do., 4 in. high	8d. to 10d. per ft. run.
Do., do., fillet only	2d. per ft. run.
¾ in. asphalte lining to roof gutters in two thicknesses	1/3 per ft. super.
Labour to outlets	1/– each.
Bull-nosed angle or external angle and drip	2d. per ft. run.

The above are approximate prices for reasonable quantities of asphalte work and would probably cover Seyssel, Limmer, Sicilian, and other good asphaltes, which would be guaranteed for three years. Asphalte is a fairly good material for dampcourse, and if laid by a first-class firm is usually satisfactory. Instances have occurred where the heat of the sun on the brickwork has softened the asphalte and caused it to squeeze out, allowing the brickwork over to move bodily forward. The foundation for asphalte paving is usually a screed of Portland cement and sand. Most asphalters refuse to lay their material on a screed of coke breeze. There is no extra charge for laying asphalte on boarding. The objection is that the heat of the sun usually causes the boards to twist or become uneven and the asphalte cracks. This can be obviated by laying the asphalte on thin expanded metal at a very small extra charge (if any) for labour, the expanded metal, of course being additional. Some firms prefer to use felt (either inodorous or tarred), instead of expanded metal last mentioned. Where concrete flat roofs are likely to crack, it is advisable to fix a little thin felt on the concrete before asphalting, so that any movement of concrete at this point will not cause cracks in asphalte.

The joints of brickwork must be raked out (when work is green) by the builder to receive vertical asphalte. The joints are then primed with asphalte and the whole surface covered with two coats which finish about ¾ in. thick. If it is thicker than ¾ in., it is usually unsatisfactory and it is apt to bulge. Asphalte is simply a waterproofing material and has little strength of its own, and where used to cover the whole area of the site to prevent flooding of basements, &c., it is necessary to weight down the asphalte dampcourse with a loading coat of 6 in. or 9 in. concrete to stop any pressure of water bursting up the asphalte. Asphalte expect ladders, scaffolding and hoisting tackle to be provided for them, and the estimator should add on about 2½ per cent. for these facilities.

St. Mary's, Whitby.

A restoration scheme is being carried on at the Parish Church of St. Mary, Whitby. The repair to the south wall of the nave are nearing completion. The treatment of the Norman doorway has been deferred until inspected by the architect, Mr. Caroe. The lead sheets of the roof have been welded together at a cost of £100. It is estimated roughly that it will cost £900 to repair the tower.

HE LIGHTING OF THE "TIVOLI" CINEMA.

The lighting effects at the new Tivoli nema in the Strand have been designed by e General Electric Co., Ltd., in collabora-n with Mr. Bertie Crewe, the principal chitect. The designs of the architects, Mr. rtie Crewe and Messrs. Gunton & Gunton, ve been carried out by Mr. F. G. Minter. e exterior is treated in a classic style and interior is decorated in Empire style. The ctrical installation work was entrusted to Berkeley Electrical Engineering Co.

The exterior of the building facing the and is floodlighted by 24 G.E.C. floodlights, equipped with 500 watt Osram gasfilled ps and 12 with 200 watt lamps. These mounted on ornamental bronze brackets l hidden by bronze screens which form an ractive feature of the frontage. The photo-ph reproduced in Fig. 1 is a night view en solely by the light of the floodlighting tallation, and shows in a most convincing nner the brilliant effect produced. Inside building interest naturally centres around auditorium lighting. The novelty of the tallation lies in the fact that practically the ole of the lamps are concealed. As far as auditorium is concerned, there is a total ence of fittings projecting from ceiling or lls, even the police lighting, except the exit ns, being included in the indirect lighting eme.

The main illumination is derived from the ned ceiling. As will be seen from the ing plan and sectional view, reproduced in s 2 and 3, the ceiling consists of one large llow dome, 54 ft. in diameter, and six sub-iary domes, 16 ft. in diameter. Hidden hin a moulded cornice around the circum-ence of each dome is a row of Osram lamps specially designed reflectors. These are anged in three circuits and are coloured ber, blue and rose respectively. Each cir-t is controlled by a dimmer, and the tching is so arranged that the colours may used independently or may be blended ether to obtain an almost endless variety exquisite colour effects. Under the gallery l balcony the lighting is supplemented by umber of ceiling panels of special design ich are arranged to reproduce the same ur effects as the main ceiling lights.

dditional illumination is obtained in ious parts of the house by amber-coloured els let into the walls. A number of .C. projectors with colour-sprayed Osram filled lamps are also sunk flush in the t of the gallery to illuminate the pros-um arch.

Fig. 1.—Exterior of the New Tivoli, showing the effect of the Floodlighting Equipment.

Chirk Housing Scheme.

A large gathering of the members of the Chirk Rural District Council and friends took place at Chirk recently, when the chairman, Mr. Geo. Rowley, formally announced the completion of the first portion of the Council's housing scheme. The principal site, forming the garden suburb of Rhos-y-Waen, provides for 136 houses: 56 "A" Type, 74 "B" Type, and six "B4" Type. This site is believed to be the second largest completed housing site in North Wales, and the cost has been about £130,000. The smaller sites at Glyn Ceiriog and Pont Fadog, providing for 25 and six houses respectively, were afterwards visited. The Council's architect, Mr. Ernest E. W. Berrington, of Wolverhampton and Oswestry, accompanied the party and explained the details of the scheme. The contractor for the houses was Mr. W. Higley, of Pontesbury, Shropshire, and for the lay-out, roads and sewers, Messrs. Hussey & Egan, of Birmingham.

The formal opening of the Chirk sewerage and sewage disposal scheme works took place on the day. The cost of the scheme was £11,400. The engineers were Messrs. Berrington, Son & Watney, of Wolverhampton, and the contractors Messrs. Hussey & Egan.

Housing in York.

The York Gas Co. have offered to lay the necessary mains for the supply of gas to some 100 houses proposed to be erected on the south-east portion of Tang Hall estate, if the Housing Committee will provide for each house a gas cooker, gas copper, and lay on a pipe for the best-bedroom fire; or, instead, if the committee would provide a gas cooker and lay on for the best-bedroom a pipe for a gas fire, and pay the sum of £2 for each house; and in the event of any parlour house, a pipe to be laid to the fire-place. The Housing Committee cannot agree to either proposal, and have suggested to the company that they are willing to lay gas pipes to the cooker, copper and bedroom fire, and buy the copper only. The Gas Co. does not agree to the proposal.

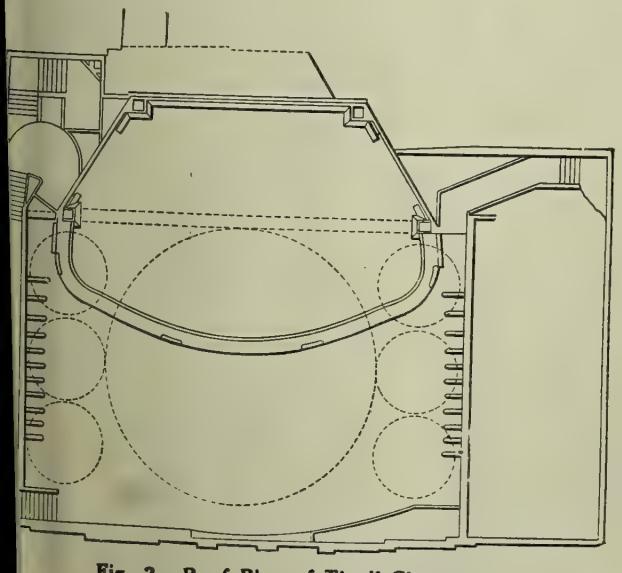

Fig. 2.—Roof Plan of Tivoli Cinema.

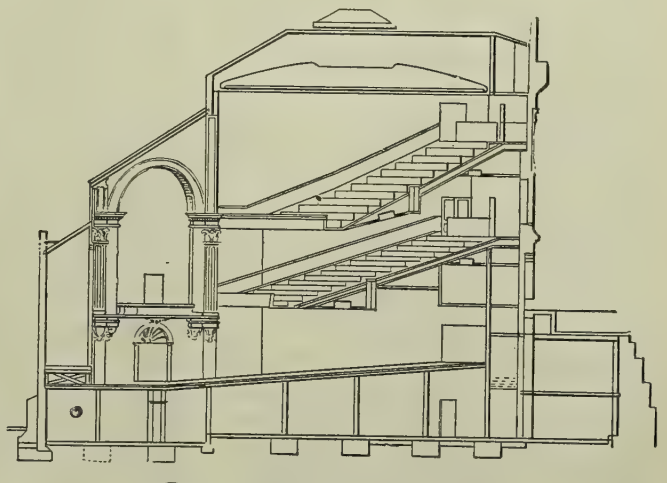

Fig. 3.—Section of Tivoli Cinema.

CHISWICK EMBANKMENT SCHEME.

A PUBLIC inquiry, instituted by the Ministry of Health and presided over by Mr. H. R. Hooper, M.Inst.C.E., was held at Chiswick Town Hall last week to hear the application of the Town Council to conclude an agreement with the Chiswick Riverside Sand & Ballast Co. to dig sand and gravel from the lands on the riverside which the Council has acquired from the Duke of Devonshire. There were present several Councillors, representatives of the ratepayers and other parties interested.

Mr. E. F. Collins, the Town Clerk, read the agreement with the company which, *inter alia*, sets out that the Council have recently acquired the riverside lands for public walks and pleasure grounds, but is unable immediately to develop the whole of such lands for such purposes. The terms of the agreement have been agreed with the company, and it will be executed as soon as the Minister of Health has given his consent. The consideration is £120,000, payable by four equal instalments of £30,000 each, and an annual rental of £700. The Council are to let to the company six pieces of land:—(1) Cubitt's Dock and basin and buildings, about five acres; (2) piece of land between the extension of Hartington-road and the boathouses, six acres; (3) the piece of land immediately to the east of the new arterial road, 14 acres; (4) the piece adjoining No. (3), 20 acres; (5) a further 20 acres, and (6) the final piece, 20 acres in extent, nearer Barnes Bridge. The lease does not include a strip of land about 200 ft. wide, adjoining the river Thames, which is reserved for an embankment, nor does it include 40 ft. of land immediately adjoining the arterial road and the railway. The term is twenty years. The Council are to have the right to the use of the surface of three of the plots until the second, third, and fourth payments are made respectively. The company are to have power to excavate and carry away sand, gravel, and ballast.

The company are to surrender to the Council for the purposes for which the lands were acquired such parts of the land from which the sand, gravel, and ballast have been excavated and the ground filled in, and the rent of £700 per annum is reduced 20s. an acre per annum in respect of the areas surrendered.

In the course of a statement, Mr. Collins said the actual excavation of the deposit and the screening and putting into water and road transport will be entrusted primarily to the Tilbury Contracting and Dredging Company, Ltd. Transport by water will be mainly dealt with by Messrs. William Cory & Sons, whose storage and distribution facilities will be at the disposal of the company. Road transport, in addition to the facilities afforded by Cory's and their subsidiaries, will be more directly under the supervision of Messrs. P. & W. Anderson, Ltd., whose motor lorries and other facilities will also be at the disposal of the company. The agreement which the Council had entered into with the company was fair and reasonable in all the terms to both parties. The Council was fully protected, and the interests of the ratepayers safeguarded. The cost to the Council of the riverside lands and properties, excluding the new burial ground, the parts sold to the Chiswick Polish Company, Ltd., and to the Middlesex County Council for the arterial road, is £130,000. The ideal proposal would have been, went on the clerk, to lay out at once the whole of the lands as open spaces, but the question of ways and means was all-important.

The Council had taken the broad view that the provision of an open space 200 acres in extent within five miles of Charing Cross was of general and incalculable public benefit, and not in the interest of only the inhabitants of Chiswick. The action of the Council was one of which Chiswick, Middlesex, and London might justly be proud. As far as he was aware, no Chiswick ratepayer had raised a word of protest against the purchase of the lands.

RATES OF WAGES IN THE BUILDING TRADE

The following are the rates of wages in the building trade in England and Wales. Every endeavour is made to ensure accuracy, but we cannot be responsible for errors that may occur:

	Masons.	Bricklayers.	Carpenters, Joiners.	Plasterers.	Slaters.	Plumbers.	Painters.	Brick-layers' Labourers.	Masons' Labourers.
Aberdare	1/7	1/7	1/7	1/7	1/7	1/7	1/7		1/2½
Accrington	1/7	1/7	1/7	1/7	1/7	1/7	1/7		1/2½

The T.C. propose to erect 150 the site of the Westgate Demolition Area. passed by R.D.C.: Six houses at Com- nue for Mr. G. Whitaker; two houses d-road, Morton, for Hird & Knowles; five houses and garage at Ilkley-road, Morton Mr. Grainger, and additions at West-lane, r Mr. Thompson.

—The T.C. has received sanction from the of Health to the borrowing of the following sums: £4,051 for the purchase of land, £1,297 for bridge works and £27,957 for road works in connection with the construction of the new road from Headingley to Moortown; £208 for cleaning out ponds at Temple Newsam; £70,000 for the erection of houses to be offered for sale to persons of the working class.—— Messrs. W. Thompson & Son propose laying out an estate outside the city boundary, at Moortown.—— The City Engineer is to submit plans of ladies' lavatories, on a site in Mansion-lane, Roundhay, to cost £1,000. ——It is proposed to grant subsidies of £100 per house to Messrs. Ford Bros., in respect of fifty-eight houses to be erected on the White Horse Estate.——The Corporation is making a contract for the erection of 100 houses at prices varying from £349 to £409.

LIVERPOOL.—The C.C. have approved of the engagement of Mr. T. Laurie Price, Consulting Engineer of Messrs. T. Laurie Price & Sons, Liverpool and London), to prepare plans and obtain tenders for the new abattoir scheme at a fee of 3,000 guineas. If the scheme does not go forward after tenders have been received, the fee to be 1,500 guineas.

LONDON (LEWISHAM).—The B.C. proposes reconstructing Sandhurst-road, Catford, at a cost of £6,000. Plans passed:—Rebuilding 185, Rushey Green, for Lovegrove & Papworth; houses, Randlesdown-road, Mr. F. Hunt, for L.C.C.; five houses, Bromley-road, for J. W. Reynolds & Co.; nine houses, Bellingham-road, for H. R. Watt; garage, 77, Bromley-road, for C. Farley & Sons; six houses, Ashgrove-road, for J. Dibben; four houses, Perry Rise, for Paine & Hobday; two houses, Lowther Hill, for Slade Betts; shop and house, Randlesdown-road, for G. W. Beattie; 10 houses, Coniston-road, for R. Goldstein; five shops and house, for Foster & Foster; two bungalows, for W. H. Bushman; three houses, Guibal-road, for C. Cutter & Sons; extension to Criterion Laundry, for Stephens & Son; addition, Crofton Park Cinema, for T. H. Sawyer & Son; six houses, Coniston-road, for W. Reynolds & Son; addition to St. Lawrence's Church Hall, for W. Harbrow; house, Brockley Park, for Rees & A. Bethem; house, Thorpewood-avenue, for A. Jenner; Congregational Church, Bellingham Green, for P. W. Meredith; chapel, Dartmouth-road, for Burt & Clarke; shop, Randlesdown-road, for G. Jackson & Lambert; eight lock-up shops, Randlesdown-road, for A. W. Wise; additions to Park Hall, Sydenham Park, for G. M. Yates; biscuit factory, Manor-lane, for W. Doddington.

MANCHESTER.—Mr. S. Ledger, of St. Mary's Parsonage, has prepared plans for a garage in Royton-street, for Mr. H. J. Ogden. The Manchester Brewery Co., Ltd., of Woodside Brewery Co., Ltd., are proposing alterations to the "Swan Inn," Everton-road and Freme-street, Chorlton-on-Medlock, to plans prepared by Mr. J. Lindores, of New Bailey-street, Salford. Mr. F. J. Riley, of Forge-lane, Bradford, has prepared plans for the conversion of house into shop and house, 27, Butler-street, Ancoats, for Messrs. Price Bros. Messrs. J. W. Beaumont & Sons, architects, 24, Braze - nose-street, Manchester, have prepared plans for alterations to Star Buildings, Deansgate, and King street, for Messrs. Kendal, Milne & Co., Ltd.

MERTHYR TY. FIL.—Nine relief of unemployment schemes, totally estimated at £40,000, are to be embarked upon by the Merthyr B.C.

MONTROSE.—The managers of Montrose Royal Infirmary have approved of a scheme of extension at an estimated cost of from £1,500 to £2,000.

MOUNTAIN ASH.—The U.D.C. has decided to take steps for compulsorily acquiring land at Abercynon for erection of a new central school.

NEATH.—The Glamorgan County Education Committee, on the recommendation of a sub-committee, has instructed the architect to prepare plans for a girls' school to accommodate 300 pupils, at intermediate stage, by the conversion of Gnoll Castle, Neath. The architect was requested to have regard to possibility of accommodating 100 additional scholars.

NEW MOSTON.—Messrs. W. Johnson & Sons, architects, of 27, Oldham-road, Miles Platting, have prepared plans for a detached house in Nuthurst-road, for Mr. S. B. Hall.

NEWPORT (MON).—The Corporation has received notification from Ministry of Transport of grant of £7,133 for roads and bridge works. The Ministry states, that formal notification of grant for the proposed new Queen's-hill to Malpas-road thoroughfare would be later issued. The Borough Engineer has been instructed to prepare a scheme for widening Shaftesbury-avenue on western side of G.W.R. bridge. Sanction has been received to borrowing by T.C. of £10,185 for proposed tram track reconstructions, and a further application to borrow £1,150 for additional works has been made.

OLDHAM.—Extensions are to be made to the Tay Mill, at Higginshaw, for the Tay Mills, Ltd. Mr. A. J. Howcroft, architect, Retiro Chambers, has prepared plans for extensive alterations to the Zion Day and Sunday Schools at Lees, for the Trustees. It is proposed to put two new classrooms on the upper floor at the north end of the school. These will be supported on pillars, and will form the roof of a covered playground.

OXFORD.—Plans passed by T.C.: Kingerlee & Sons, Queen-street, printing works, Pembroke-street, St. Aldate's-street; F. Organ, 367, Cowley-road, addition to Canterbury House, north-east side of Cowley-road; Mrs. Alexander, house, north-east side of Bartlemas-road.

PONTARDAWE.—It is reported that Messrs. Gilbertson are to take over the Pontardawe alloy works for conversion to sheet mills.

PORTHCAWL.—The G.W.R. Co. has agreed to giving the U.D.C. certain land at Nottage on condition that the work of widening the Nottage-road is put in hand immediately. By private treaty a fair number of private building plots on the west side of Porthcawl have been ceded recently and plans will shortly be presented to U.D.C.

RAMSGATE.—A big scheme for the alteration of the railway systems in Thanet has been adopted by the Southern Railways, and was detailed to the members of the T.C. The scheme will take until the summer of 1925 to complete, and involves the abolition of the existing Harbour Station at Ramsgate and the town station at Ramsgate, as well as the Sands station at Margate. Ramsgate will be served by a modern new station near St. Lawrence, and an extra station at Dumpton Park, between Ramsgate and Broadstairs.

ROCHDALE.—The Buildings Sub-Committee of the Rochdale Education Authority had tenders for an open-air school, but decision was deferred for further enquiries. The Licensing Justices have approved the plans for structural alterations to the "Mount Pleasant Inn," Whitehall-street, which entails increasing the present drinking accommodation. —The T.C. has sanctioned two building schemes for 100 houses each, one to be carried out by private enterprise with a subsidy of £100 per house, and the other a municipal scheme to be carried out by the Housing Committee.

SPENBOROUGH.—Plans passed: Alterations and additions to Providence Mills Rawfolds, for Messrs. Briggs Bros & Co., Ltd.; house at Halifax-road, Hightown, Liversedge, for Mr. H. Brook; two houses at Mistinglane, Gomersal, for Mr. T. Drake; garage at Leeds-road, Liversedge, for Mr. R. L. Bowling; two houses off Knowles-hill, Liversedge, for Mr. D. H. Beumont; additions to house at Bradford-road, Cleckheaton, for Dr. Magoveny; cooling tank at Victoria Mills, Bradford-road, Cleckheaton, for Messrs. Geo. Anderton & Sons, Ltd.; house at Leeds and Whitehall-road, Scholes, for Mr. L. Holland.

STAFFORD.—The Ministry of Health has given approval to the assisted housing scheme of the T.C., which involves the erection of 40 houses.

STOCKTON-ON-TEES.—Plans passed by T.C.: 100 houses to be erected by the Corporation on the Blue Hall Estate, Norton; alterations to 132, High-street, for Messrs. J. Smith & Sons (Cleaners), Ltd., Dewsbury; alterations to the Leeds Hotel, Bishopton-lane, for Messrs. Allsopp & Sons, Ltd., Burton-on-Trent; motor garage for Mr. J. B. Rowland, 10, Cranbourne-terrace; alterations to the Unicorn Hotel, High-street, for Messrs. J. W. Cameron & Co., Ltd.; outbuildings, Manor House Farm, Yarm-road, for Sir Gerald Fowler Burton; farmhouse and buildings at Burton House Farm, Hartburn, for Sir Gerald Fowler Burton; pair of semi-detached houses, Station-road, Norton, for Mr. J. F. Walker, 9, Cambridge-road, Thornaby.

STRETFORD.—A scheme was submitted by the Russell Building & Contracting Co., Ltd., Princess-street, Manchester, for the erection of flats in Seymour-grove, with financial assistance. Arrangements are being made for the provision of playing fields on the land at the rear of Longford Park. Application is to be made by the U.D.C. to the Ministry of Health for sanction to the borrowing of a sum of £8,700 to defray the cost of the provision of underground conveniences and contingent road widening at the apex of Chester and Stretford-roads, Old Trafford. —Plans passed: 18 houses, Rosthern-avenue, for the Artistic Housing Co., Ltd.; two houses, St. John's-road, for the Artistic Housing Co., Ltd.; six houses, Urmston-lane, for Mr. Richard Howard; garage, 53, Stamford-street, for Mr. James Houghton; conversion to shop, 530, Chester-road, for Mr. O. Harris; store shed, Westinghouse-road, for Messrs. Courtaulds, Ltd.; boiler-house extension, Westinghouse-road, for the Ford Motor Co. (England), Ltd.; additions to offices, &c., Dynamo-road, for the Lancashire Dynamo & Motor Co., Ltd.; pavilion, Victoria Park, for Stretford Urban District Council.

WAKEFIELD.—Plans passed by T.C.: Mr. J. P. Firth, house, Dewsbury-road, for Mr. W. Nettleton; Mr. W. H. Ogden, alterations and additions to house, Dewsbury-road, for Mr. A. Peckett; Messrs. E. Green & Son, Ltd., 26 houses, Doncaster-road and Sugar-lane; Mr. W. H. Watson, house, Carr-lane, for Mr. J. Clayton; Mr. W. H. Ogden, two houses, Bromley Mount, for Messrs. Wild & Atkinson; Mr. H. Dobson, two houses, Bromley-mount, for Mr. H. Rogers; Mr. H. Dobson, two houses, Barnsley-road and Welbeck-street, for Mr. E. Howe; Mr. W. Wrigley, alterations and additions to laundry to St. John's Home, Kilby-street, for the St. John's Home Committee; Mr. W. H. Ogden, store, back Bowman-street, for Mr. F. Gledhill; Mr. W. Wrigley, alterations and additions to the George Hotel and the conversion of a portion of the hotel and a lock-up shop into four lock-up shops, Kirkgate and Southgate, for Messrs. Clayton & Dews. ——Plans passed by R.D.C.: Shop at Calder-grove, for Mr. A. Sherwin; bungalow at Bullcliffe North Wood, for Denby Grain e Colliery Co., Ltd.; two houses in Durkas-lane, Crigglestone, for Mr. Lister.

FIRES

BARRY.—Damage estimated at £10,000 has been caused by fire at the premises of the Barry District Co-operative Society, Ltd.

CHALK FARM.—Extensive damage has been caused by fire at the premises of Messrs. T. H. Lewis, Ltd., van, carriage and motor-body builders, Gloucester-road, Chalk Farm, N.W.

DAWLISH.—Considerable damage has been done by a fire at the dwelling of Mr. F. Dart, fishmonger; Mr. A. H. Morton, cafe keeper; and Mr. A. Payton, bootmaker, Brunswick-place.

LLANDILO.—The Gurrey Tannery, Llandilo, has been completely gutted by fire.

RAMSBOTTOM.—Damage estimated at £11,000 has been caused by a fire in the cotton-waste breaking department of Messrs. J. Ramsbottom & Sons, Ltd., Lodge-lane, Shuttleworth.

SUTTON.—Heavy damage was done by fire, which broke out in Sutton High-street, in a timber yard about two acres in extent, belonging to Messrs. Wakeford & Co., and Leyton Timber Co. Five large iron and brickwork sheds filled with timber were burned to the ground.

TRURO.—A large portion of the premises occupied by the Royal Printeries, and the offices of the *Cornwall County News and Gazette* were destroyed by fire this week.

WALSALL.—The Picture House erected in 1920 has been completely destroyed by fire. Damage is estimated at £100,000.

NEW BUILDINGS IN SCOTLAND.

Elgin.—HOUSES.—The Board of Health has given provisional sanction to the erection of three more blocks of houses at Maisondieu, making 12 additional houses of three rooms each.

Kirkintilloch. — HOUSES. — The T.C. has decided to proceed with the erection of 100 houses of two apartments each, of the tenement type.

Linlithgow.—HOUSES.—At a recent meeting of the Housing Committee instructions were given to the architect to proceed with alternative plans for one block of four houses and two blocks of two houses each.

Dumfries.—HOUSES.—The T.C. will build 40 more houses at Cresswell, the total cost of which is estimated at £14,600. The plans have already been passed by the Dean of Guild Court.

Newton Stewart.—The Board of Health has agreed to the allocation of eight houses under the Town Planning (Scotland) Act, 1919, and the T.C. has decided to proceed with the work.

Broughty Ferry.—BATHS.—The members of the Corporation of Broughty Ferry have been asked to report on the site and plans for the baths at Broughty Ferry.

Ayr.—HOUSES.—Ayr Dean of Guild Court have passed plans for the building of houses, estimated to cost over £25,090. The majority of the plans are for houses to be built under the Corporation subsidy scheme. Grants of £100 per house have been offered to private builders. One builder is going to erect twenty two-story cottages at an estimated cost of £14,000; and another builder is to build seven dwelling-houses, estimated to cost £4,900.

Gourock. — CHURCH. — Plans have been approved for a Baptist church to be built at the corner of Shore-street and King-street, Gourock, with accommodation to seat 300 persons.

Edinburgh.—WAR MEMORIAL.—Intimation has been made to the National War Memorial Committee of Scotland that the Cabinet has granted permission to proceed with the erection of the Memorial within the precincts of Edinburgh Castle. The scheme includes the conversion of one of the modern buildings for a hall of honour.

NEW BUILDINGS IN LONDON.

Tottenham Court-road. — Messrs. John Mowlem & Co., Ltd., are installing escalators for the Underground Railways at Tottenham Court-road Tube Station.

Hammersmith, W. — BROADWAY HOUSE. — This building is situated at the junction of Broadway and Brook Green-road, having a frontage to these streets and abutting at the rear on the Hammersmith station of the Metropolitan and Great Western Railways. The building will have shops on the ground floor with basements connecting, and offices in upper portion. The area of building is approximately 6,500 sq. ft.; length of principal frontage, 164 ft.; height from pavement to parapet, 62 ft.; six floors (not including basement); steel-framed building (stone-faced up to first floor); brick above with stone dressings; back and side elevations terra-cotta; concrete floors. Mr. J. Ernest Franck, F.R.I.B.A., is the architect; and the general contractors are F. D. Huntington, Ltd., 11, Hanover-square. W.1. Sub-contracts already placed: Steelwork, Messrs. Dorman, Long & Co.; stonework, Messrs. F. J. Barnes, Ltd.; terra-cotta, Messrs. Doulton & Co., Ltd.

Hammersmith.—HOSPITAL WORKS.—Messrs. John McManus, Ltd., have signed a contract for the erection and completion of Hull Martin Ward, operating department, and paving patients' department at the West London Hospital, Hammersmith.

TRADE NEWS.

Of the many substitutes born of high prices and shortage but few can have reached the apparently perfect copy of a natural material which is the chief characteristic of "Dekart." This material has been produced to replace wood and tiles for interior use, and in addition to being cheaper than wood, the advantages of fire-resistance and the absence of any tendency to split or warp or otherwise lose shape are claimed for it. With this material any period of wood panelling can be faithfully copied, both in colouring and grain, and it has the same attributes as plaster in the manner in which it can be moulded to copy or form enrichments, carving, and other decorative features. The manufacturers and patentees of the material (Messrs. Associated Crafts, Ltd., of Bridge Works, Cricklewood Broadway, London, N.W.1) have issued an attractive brochure in which many of its applications are described. These include panelling, plaster work, friezes, ornamented pilasters, door framings, beams, rafters and doors, mantels and over-mantels, and ceilings. Duplicates of decorative metal-work, such as electric light and gas-fittings, are also provided in this material, and owing to the fact that it is waterproof it fulfils many of the functions of metal.

One of the objects of the Decorators' Exhibition to be opened at the Holland Park Hall on October 17th is to show the craft and the public the latest developments in the craft. Visitors will be shown the method of educating the young decorator, and new designs and inventions.

An attractive catalogue and price list of their various kinds of "Reliant" fencing is issued by the manufacturers, the Reliant Fencing Co., of Hildenborough, Kent. This company is entirely British and their fencing is made of British material by a British staff, who have had much practical experience in the work.

Messrs. Perkin and Co., of Leeds, are exhibiting on their stand at the Shipping, Engineering and Machinery Exhibition (No. 20, Row D), a new device, known as the "Rapid" stair-housing appliance, for the routing of stair strings, shelving strings and similar work, which may be applied to any vertical spindle moulder in a few minutes. The makers claim that work can be produced at least equal—and often superior—to that produced on an overhead routing machine. The main part of the apparatus is a universal guide plate or templet giving the outline of a rise and tread with nosing and wedge-room, and adjustable over a range of sizes covering all ordinary practice. This is arranged to clamp to the edges of the stringer, on the side opposite from that on which the routing is to be done, by means of a single thumb-nut. It is further arranged in such a manner that one setting will do either r.h. or l.h. stringers, and so secure perfect matching. The guide plate is graduated throughout its range in order to facilitate setting, and the only marking off required is the provision of pitch marks. After a riser and tread have been routed the guide plate is released by a quarter turn of the thumb-nut, slid along to the next pitch mark and reclamped. A fifteen-riser string can thus be completed easily in 25 minutes. A special cutter is inserted in the spindle of the machine and adjusted to project above the surface of the machine table a distance equal to the depth of routing desired, usually about 7-16 in. Vertically above the cutter a guide roller is carried on a steel adjustable arm, which is clamped to the edge of the machine table. This guide roller is the same diameter as the cutter and engages with the guide plate, so that the shape of the latter is faithfully copied by the routing cutter on the underside of the stringer. This arrangement has the further advantage of allowing the chips to fall under the machine, and the operator has an unobstructed view of the guide plate and roller.

THE BUILDER

JOURNAL FOR THE ARCHITECT AND CONSTRUCTOR.

WITH WHICH IS INCORPORATED "THE BRITISH ARCHITECT."

OL. CXXV.—No. 4207. SEPTEMBER 21, 1923

THE BRITISH INSTITUTE OF INDUSTRIAL ART.

SOMEONE, probably an architect, is reputed to have exclaimed at the conditions which required him to walk a mile or more on purpose to see a cottage which had been properly designed. The critic is justified in some such feeling in being called upon to give special notice to joinery, pottery, textiles, printing, &c., h under happier circumstances industry—but for the em which has grown up—would ordinarily supply. So we collected together within the North Court of the Victoria Albert Museum a very various collection of craft work ing a leaven to the present state of things. And there eally a great amount of very creditable work, so much it is hardly possible to summarise it or to pick out parti- r examples without neglecting others just as good. We he influence of the "Morris" group on the younger workers, this is a good sign. Another very important one is the ber of local guilds, federations and art schools, who con- ute to the exhibition. These local craft centres spreading ughout the country—these small workshops on sound smanship lines—justify in us the hope of that extension he small industry, so ameliorating present industrial con- ns and perhaps ultimately largely superseding them.

Case No. 1, with examples of textiles and decorated boxes, ld not be missed, or the flag over the entrance, "Arms of s College," by Kruger Gray. No. 2, panelled chest in lish oak, designed by H. Wilson, is quite a fine example hed with a little virtuosity; the craftsman appears to registered Mr. Wilson's design on the material rather through it, and it includes the want of breadth which a limitation imposes. The same applies to No. 7, though are in many ways excellent. The cases should be carefully ined as they contain many attractive features, but too y to enumerate here. Case No. 66, containing well designed and some good textiles, is one of the best. The various oits of this firm of craftsmen, carrying on work on traditional icraft lines at Broadway, Worcestershire, are one of the res of the exhibition. The charmingly worked samplers, No. 95, Nos. 108–9, by Anne Simpson and Dora A. nsley, should be noticed. Good examples of pottery are n in Case 125 and Case 126, but the pottery on the whole very varying merit. In a general survey such as this n only note a few examples here and there. Mr. Anning fine design, which faces us as we enter, for the mosaic Andrew," for the Lobby of the Houses of Parliament, ggestive, but in such cases the results are determined ere, but in the proper working of the material when ted in mosaic. The same artist's sketch for a memorial w to Edward Stott, A.R.A., is interesting, otherwise the y of glass cartoons and sketches calls for no special notice. of the best work in the sense of the improvement it shows the printing section: there is no direction of industry ich more progress has been made.

e must not end these scattered criticisms without referring "Church and Monumental Art Section." This is a very l addition, and calls attention to more suitable and ing ways of treating monumental masonry, though we whether No. 456 shows the best direction for the abilities s. Phœbe Stabler who, in addition to this exhibit, shows a more characteristic and buoyant example in the little garden figure of a boy. There are excellent textiles shown, and the usual display of posters. A very attractive exhibit is that of a room designed for a cafe by Russell & Sons, the furniture and surroundings of which are all made in their workshops, suggesting how far more agreeable such tasteful and genuine surroundings would be over the marble veneers and false glitter of others we can think of.

Exhibitions such as this—and there is much sound and beautiful craftsmanship included in it—none the less set us thinking, for the character of such exhibitions to-day serves rather towards confusing than enlightening the public mind. Where we shall look for art, and where find it, depends more on ourselves than on exhibitions. If we were to regard the British Institute as the source and exemplar of the best craftsmanship to-day, which its official character countenances, we should be much mistaken. Some of the finest craftsmen are not to be found in it at all. And perhaps the Institute realises its objects all the better in thus accepting its own limitations; based on industrial production, it endeavours to promote better standards through the exhibition of work alongside it of more taste and character. It must not, however, be forgotten that the work of most creative and distinguished quality, which is an end in itself, has nothing to do with commercial industry, and it should not be looked for in such an exhibition. Organisation tends to promote the good average of the time, not the best work, which is more often its own security. No doubt it is difficult to draw any precise line, and the Institute, like most bureaucratic organisations, fosters what it understands. It may be doubted, however, to take an instance, whether the wholly personal quality of Mrs. Stabler's work is not in some danger to its own point of view in the bias set up through such an exhibition; for the draw towards an applied usefulness for such work may detach it from its own more authentic impulse, from which it should not be withdrawn. The arts suffer much to-day from the artist seeking his work too much, from watering his own garden. And though there are many instances in this exhibition in which the talent of the craftsman is helped by this applied usefulness for his work, it is impossible not to see the work of other craftsmen occupying a perilous borderland, balanced between art and commerce, uncertain of their hold on either. In such a view there enter considerations of the highest import. If, for the purpose of improving industry, art were to suffer—if it in any way compromised the demands of its own nature—such compromise were to choose the worse for the better and injure both. This difficulty arises through the absence of tradition, owing to which good craftsmanship has been removed from its natural setting, so that we now look for it in a special situation, instead of emerging unconsciously out of the national industry, which it did until the machine took the craftsman's skill away.

A more democratic basis is growing for art, and therefore a truer relation to life, but accompanied by all the dangers lying in a half-educated democracy, and we have therefore to be most careful lest, in raising the average, promoting the good we do see, that we do not obscure the best, or think that art can be circumscribed by its applied usefulness only, so shutting out the larger horizons from our eyes.

NOTES.

St. Martin's-le-Grand Site.

It is recorded that Pericles after the Persian wars found employment for the disbanded soldiers in building the Parthenon. We might recall this and the inferences to be derived from it when seeking directions of activity for our unemployed, and consider the possibility of constructing romances as well as roads. This thought occurs to us when reading of the recent action of the Goldsmiths' Company in buying part of the site of the old General Post Office in St. Martin's-le-Grand, so that the fine architectural features of their hall should not be hidden by new buildings. But does not this praiseworthy and public-spirited action suggest that with such a lead we ought to go yet further? Would it not be an immense improvement in a crowded district to secure the whole site, and to give employment by laying it all out as a public place, with lawns and walks and sheltering trees? In such a situation the improvement would be so great, so spacious and enlarging to its amenities, that we have only to glance at the site to see its appropriateness for such development. An improvement like this cannot be estimated on economic values as we understand them. The value of the site for rents is a less contribution to the wealth and dignity of the city than its value for beauty. Nor is the idea to be rejected on such grounds—or ground rents? We need the spirit of a Pericles to enlarge our conceptions of profit and the scope of possible employment, and to appeal to the artist in all of us. Does not the imagination reach out to greet this possible transformation of a great site, from its mournfully barricaded and hideous defacements through advertisements into a gracious open place adorned by nature and art, and may not the example of a Pericles help us to find courage for such an aim?

The Factory Beautiful.

At the meeting of the Industrial Welfare Conference at Oxford Mr. Eldred Hallas (General Workers' Union, Birmingham) condemned the architecture of modern industrial buildings. He said it was a pity that when works and factories were designed utility was considered almost to the exclusion of any idea of beauty. Why should not factory areas be as beautiful and desirable, he said, as residential areas, and interspersed with dwelling-houses, one vying with the other in beauty? It was surely as desirable that a factory should be approac by a boulevard as the mansion of owner. We may all feel sympathy w the views expressed by Mr. Hallas, we think it can be claimed that wh architects are concerned in the erectio factories and industrial buildings uti is not always considered "almost to exclusion" of any idea of beauty." ideas of clients not infrequently clash ideas of beauty, but we know of a siderable number of instances in wh this conflict does not exist.

New Confederations.

New movements are em ing of international imp ance aiming at a national organisation for and its greater influence in the State, we ought not to look askance where g ideas are concerned if they move firs rather nebulous shape or fail to generous consideration for the propo contained in them. Nor should we examining the proposals contained in Report of the British Confederation of assume that they are hostile to exis organisations. To invest associati with wider aims than that of preser themselves only, to detach them from exclusiveness of group and party onl a wider activity, is rather to penet them with fuller life. We can all a with the claim for the recognition of professional worker equally with tha capital and labour, and that his inte are equally important to the welfar the State, and should be set on a foo whereby his economic interests are left to everybody but himself, whic practice means, as has been said, "crea prosperity for everyone but hims Such an improvement would bring a strength and development to the S itself, art exercising its proper influ not as only concerned with itself, but conceptions of government and its c tion to more enlightened ends.

The New "Tiers État."

Whereas at present divide the interests of community as those r sented by capital and la these new movements make the cla quite rightly—to include as one equal interest in the State the capit the Mind. There are endless consi tions for the public welfare in whic arts could exercise beneficial help, have no organised representatio security for their proper influence such matters. Better conditions fo artist are, we know, difficult to pr nor is he himself as yet endowed wit larger civic aim which would mak help wholly disinterested and effe though a more civic sense is grow our younger men. It is felt by then isolated art societies are not the means of realising the present need that some larger confederation w

Church of St. Trophisme, Arles. (See p. 438.)

Dovecote at Chateau d'Argilliers. (*See p.* 438.)

through them, co-ordinating and rging their aims, would effect results ore public utility. At the same time, must also regard the difficulties. It his own brother artists who failed to gnise the claims of Millet, of Linnell, William Blake, and others. What ederation can unite the good—that can most of us see—with the best, ch, alas ! is so seldom seen ? Mr. V. Lanchester, President of the Town ning Institute, tells us that "Com- tion would help to reduce that evil to inimum and give him (*i.e.*, the artist) hance of realising his deepest and st conceptions." Deepest and truest eptions are oftenest realised, not re ease and competence assist them, by the inviolable fortitude of soul in noblest nature, and though we can pathise with many of the aims of this Confederation, we must not expect bias, or that the best things are to be ved without personal conviction and fice.

British tute of strial rt.

THE exhibition of this organisation (referred to in our leading article) raises the thought that we must not depend too much on what is ht before us through such organisa- as representing more than it does, at it diminishes our own responsi- to see other and wider aspects of it, hus at the end we reach the true sion that all fostering and improving for art are in one sense a constant r to the very object and the only ty for its lasting welfare, and the gs with which it can endow life n educated and enlightened people. he effective usefulness of any such sation is shown in discovering and ting the finest work, not in obscuring it, and if the effect of the multitude of exhibitions, so much organisation, the development of sounder craft practice —all good in themselves—appeared to us as covering the whole field, the public would be farther away from the reality than before. Under bureaucracy there is no worse danger than that of the good becoming the enemy of the best, and it is one it behoves us to regard. For the best creative achievement contains always a sort of challenge in it, it disputes our accepted "good," and bureaucracy fears it as a challenge to its own supremacy, as truth is always a challenge to anything but truth. When "encouraging" art let us not forget the artist.

Lectures on the History of Architecture.

THE University Extension Board of the University of London, South Kensington, have arranged for the coming Session a number of very interesting courses of lectures on History, Literature, Art, Architecture, Geography, Economics, &c., to be delivered in various parts of London and the suburbs. Amongst these is a fully illustrated course on "The History of Architecture (Part I, Ancient)," to be given by Sir Banister Fletcher, F.R.I.B.A., at the Central School of Arts and Crafts, Southampton-row, on Wednesday evenings, at 6 p.m. The subject will be treated in a popular and non-technical way, and the course will be equally suitable for the professional as well as the non-professional student. We wish more lectures of this character could be arranged, not only in London and other large towns, but in suburban areas where people live.

Church Congress Exhibition.

THE Church Congress Exhibition, which is held during Church Congress week, will be opened on Saturday in the Drill Hall, Mill Bay, Plymouth, and will close on September 28. The Exhibition consists of two sections—a Loan Collection and a General Section—which will include the stalls of church furnishers, artists in glass and metalwork, &c., and we understand that a most comprehensive and interesting exhibition has been arranged. *The Builder* model of Old St. Paul's will be shown, as well as several drawings by the late H. W. BREWER.

A Long Record.

A LONG record of service to the profession is that of Mr. Maurice B. Adams, who is now retiring from the *Building News* after some fifty years of editorial work with our contemporary, a record only, we believe, once exceeded. Mr. Adams has closely followed the development of modern English architecture, of which he has written and illustrated a very large amount and has contributed interesting papers to the R.I.B.A. He will carry with him into his retirement the good wishes of a large number of friends.

Church of St. Trophisme, Arles: The Cloisters. (*See p.* 438.)

GENERAL NEWS.

Professional Announcements.

Mr. L. G. Williams, architect and surveyor, has removed from 108, Vaughan-road, Harrow, to new offices at Greenhill-chambers, 8, Greenhill-parade, Harrow (telephone, Harrow 1034), and will be pleased to receive catalogues, &c.

The London offices of Messrs. Chas. Heathcote & Sons, whose head office is in Manchester, have been changed from 110, Cannon-street, to 38, Parliament-street, S.W. 1.

Messrs. Robinson & Phipps, architects and surveyors, have opened an office at Midland Chambers, 39, London-road, Leicester, and will be pleased to receive manufacturers' catalogues.

Appointment.

Mr. H. W. Butler, County Surveyor for Cumberland, has been appointed County Surveyor for Shropshire.

Devonshire Park, Eastbourne.

At a meeting of the Eastbourne Town Council the question of the purchase of Devonshire Park was discussed. The premises comprise about twelve acres of ground, a concert hall accommodating 2,500 persons, vaudeville and lecture halls, and a number of pavilions, swimming and other baths, restaurant, tea rooms, bars, &c. It was stated that since the town on a poll rejected an offer to take £110,665 there had been a further capital expenditure to the amount of nearly £10,000. After discussion the Council instructed the committee to ascertain the precise terms on which the company are prepared to sell. It was stated that the purchase would necessitate the promoting of a Parliamentary Bill, which would give the ratepayers an opportunity of either approving or rejecting the proposal.

Payment by Results.

A correspondent of *The Times*, dealing with the question of payment by results in industry, refers to a system in force in America. This method he outlines as follows:—"At the end of the year, or at any other time, a firm will calculate its gross profits, and deduct everything but interest on capital. The balance represents the net profits of the busines for the purposes of the plan. The firm then deducts an amount which would represent a fair return upon its capital, having regard to the character of the business. For an average undertaking, with no unusual risks, this might be fixed at about 6 per cent. The balance then remaining would be divided, as a rule, equally between the firm and its employees. The employees' share would form a certain fraction of the total yearly wage and salary list. Supposing it were one-tenth, then each employee would receive a 10 per cent. bonus."

Road Planning.

In the course of a letter to the Press, Mr. Thomas Adams, Consultant to the West Middlesex and Thames Valley Joint Town-Planning Committee, states that there is urgent need for a constructive policy in planning highways in advance of expending money on new construction. "Owners of land abutting on highways and local authorities have," he said, "both got responsibilities, and should share in the cost of securing the desired improvements. How is the matter to be dealt with in a manner that will meet the just claims of the owners and not impose too big a burden on the public purse? There are too many difficulties confronting both owners and authorities at the present time, and some compulsory power is needed to be vested in the Ministry of Transport to enable it to bring about the joint action that is necessary and an equitable apportionment of cost between the public and the owners of land. There is also need for more regard to be paid in connection between different phases of road traffic and building problems; for instance, to the interrelation between use, heights, and densities of building and road widths."

The late Mr. J. B. Everard.

The death is announced of Mr. John Breedon Everard, J.P., M.Inst.C.E., F.R.I.B.A., which occurred at his residence, Woodville, Knighton Park-road, Leicester, on September 12. Mr. Everard, who was aged 78, had been ill for some time of an affection of the heart.

Mr. Everard, who was born at Groby, Leicester, carried out many important works as an engineer and architect. As resident engineer he superintended the construction of the Kentish Town to St. Pancras section of the Midland Railway, including the foundations and roof of the station itself and the tunnel underneath to link up with the Metropolitan line. After returning to Leicester and commencing practice on his own account he designed and built the Leicester Cattle Market in 1871, a work considered to be one of the best of its kind in the country. He was one of the originators of the great Derwent Valley water scheme which supplies Sheffield, Nottingham, Leicester, and Derby with water, and he constructed the Leicester section from Sawley to Hallgates (Leicester), including the aqueduct over the River Trent. He was also responsible for the construction of the Swithland Reservoir at Leicester and the works connected with it. In conjunction with his firm, Messrs. Everard, Son, & Pick, he carried out some large architectural works, including the Leicestershire and Rutland Counties Asylum at Narborough, the Leicester Technical and Art Schools, and the remodelling of the Leicester Royal Infirmary.

Mr. Everard was a Justice of the Peace for Leicester and the county, and High Sheriff of Leicestershire in 1913–14, and during his year of office presented a mace to the city as a memento of his association with Leicester in so many municipal enterprises. He was a keen antiquary and he did good service as a member of the Church Extension Board.

Mr. Everard married, in 1868, a daughter of the late Mr. Samuel Mumford, of Dartford, Kent, and he has had two sons and two daughters.

COMPETITION NEW

Burgess Hill.

The design of Messrs. George Baines & F.R.I.B.A., of 121, Victoria-street, Westmi S.W.1, has been placed first in the compe for new premises at Burgess Hill, for the ward's Heath Co-operative Society, Ltd. estimated cost of the structural work is £

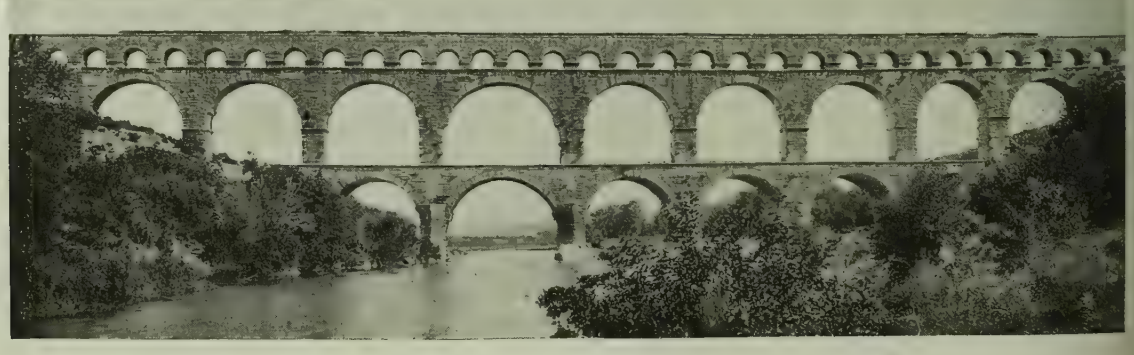
Taunton.

Designs for a war memorial, for the Coun Taunton School. (See advertisement this w

Dudley.

The Public Works Committee of Dudley T Council announce that they have approve conditions of competition for the designs o proposed "Brooke Robinson Memorial" war memorial, to be erected on the site a junction of St. James's-road and Priory-street had, on the nomination of the Royal Inst of British Architects, appointed Mr. W. C Green, A.R.A., to act as assessor. The ditions provide that the competition sha an open one; that premiums of £300, £200, £100 shall be given, the first-named sum t absorbed in the fees for the erection of buildings; and that the proposed new build harmonise with the existing Town Hall Police Station. Sending-in day, January 1924. (See advertisement Sept. 14.)

Eastleigh and Bishopstoke.



FOR THE U.D.C.—Designs for a new asse hall and extension of council buildings. miums 50, 30 and 20 guineas. Sending-in December 3. *Banned until conditions approved by R.I.B.A.* (See our issue Aug. 24).

Southsea Common Lay-out Competitio

FOR THE B.C.—Conditions and particula premiums will be forwarded on applicati the Town Clerk. Sending-in date, October *Banned by R.I.B.A.*

Other Competitions.

Other competitions still open includ following (the dates given are, first the sen in date, and second the issue of *The Build* which full particulars were given):—Sing College (Jan. 1, 1924; March 30). Hul Gallery (Nov. 5; May 4). Mint compe for plaques (Sept. 30; May 25). C scheme (Sept. 30; June 29). Memorials Missing (Jan. 1, 1924; Aug. 3). Halifax out—*Banned by R.I.B.A.* (Oct. 1). Sw Masonic Hall (Oct. 3). D.I.C. House, chester (Oct. 15; Sept. 7). Chiswick Em ment—*Banned by R.I.B.A.* (Oct. 15; Se Coatbridge War Memorial Aug. 31).

Le Pont du Gard, Nimes. (*See p.* 438.)

HE EARTHQUAKE IN JAPAN.

By CHARLES DAVISON, Sc.D.

ıE destruction of buildings during the ıt disaster in Japan was due to three es—to the earthquake itself, to the fires broke out at once through the breaking of pipes, and easily spread as the water-mains injured, and to the sea waves that followed tly afterwards. To apportion the damage ng these three causes is at present impossible. gh it would seem that in Yokohama the k was mainly responsible; in the naval on of Yokosuka partly the shock and partly ea waves; while the city of Tokyo probably red as much from fires as from the shock started them.

uildings in Japan are constructed with a to the danger from earthquakes, and the paratively small loss of life in recent shocks s how effective the precautions have been. instance, in the Mino-Owari earthquake of only 190 lives were lost out of a total of 000 at Nagoya; in the Messina earthquake 08 about half the population of that city buried in its ruins, and, if anything, the k was stronger at Nagoya than at Messina. withstanding the heavy loss of life in the ıt earthquake, the death rates are com-tively low, only 5 per cent. in Tokyo and er cent. in Yokohama. Comparing these the figures for less violent earthquakes in —for example, 71 per cent. at Montemurro ng the Neapolitan earthquake of 1857, 81 cent. at Avendita during the Norcian quake of 1703, and 91 per cent. at Avez-during the earthquake of 1914—it is ent that, but for the careful construction apanese houses, the tale of disaster would been very much higher.

a recent number of *The Builder*, I gave short summary of Professor Omori's r on the behaviour of the steel-brick lings at Tokyo during moderately strong semi-destructive earthquakes. Professor ri concluded that properly-built steel-brick lings will never be totally destroyed by an quake, however strong, and that the worst could happen to them would be the produc-of cracks in curtain-walls. A detailed ination of the effects on these buildings e of considerable value. At present it is what uncertain whether the damage was rd by earthquake or by fire. The Kaijo ing at Marunouchi, the oldest of the and finished in 1919, collapsed, causing ands of casualties; but according to more t accounts most of the high concrete ings show fissures only in the third-floor es; above and below that floor there is harm done, a result which is somewhat ed to Professor Omori's belief that the f damage is less in the higher stories than lower.

st of the buildings in Tokyo were made of and it was to this that their rapid destruc-y fire was due. Such houses collapsed e under the shock, the walls bulged rds and the heavy roofs fell in and so ned thousands of people, many of whom terwards burned. It is estimated that 440,548 houses in Tokyo no fewer than 5 collapsed or were burnt. The percentage s was even higher in other places. At ka only 150 out of 11,800 houses were stroyed; at Yokohama 100 houses are have escaped damage, while 71,000 ined. Much of the destruction was due the first great shock but to the less violent that followed. For instance, all the s across the river in Tokyo, which were crowded with refugees from the fire, ed during a later shock and many thou-were drowned or killed by the fall.

Chateau d'Argilliers. (*See p.* 438).

CORRESPONDENCE.

[While we are glad to publish letters on professional and other matters of interest to our readers, it must be understood that we do not necessarily endorse the remarks of correspondents, who will oblige us if they will express their views as briefly as possible.]

Sanitary Arrangements, House at Hampstead.

SIR,—I was interested in the plans and elevations of a house in the Hampstead Garden Suburb which you illustrate on p. 416 of last weeks' *Builder*, but was surprised to see that the w.c. on the ground floor is shown leading directly off the kitchen. This does not seem to be a very desirable arrangement according to modern ideas, and, of course, is not allowed under the by-laws of London and most of the surrounding districts. If the building by-laws of Hendon permit of this it is time they were revised and brought up to date.

W. HASLIP.

Leyton.

Payment by results in the Building Industry.

SIR,—It may not be out of place for one who has had a number of years' experience in connection with the "payment by results" system to furnish a few remarks by one who has "suffered" as an employee.

It is anticipated that the "bait" of a share of a firm's profits would require a lower salary in consequence. When the time comes, however, to participate in results, the reply invariably is that the auditors make out there is nothing due. Only recently an admission was made by a director that there were profits made, but it had been decided to add them to the "reserve" fund. The only course open to an employee is to secure a smart accountant at an enormous cost to investigate the books; that is, if the employee can bear the cost, which is doubtful.

In another case, notwithstanding the large percentage put down for overhead charges, other charges such as printing and advertising were introduced to procure a balance on the wrong side. Numerous other cases could be furnished from personal experiences extending over a number of years, during which "heart and soul" have been put in to increase the "turnover," and even written agreements "turned under," leaving one no other option but to seek fresh fields and pastures new. Trade Unions compel additional payment for overtime, but in my capacity there is plenty of overtime without extra payment or share of profits.

Esteeming your kind insertion of this letter,

"ESTIMATOR."

["Estimator's" experience has been unfortunate. We do not share his belief, if it is his belief, that employers would not act honourably in the event of a "payment by results" system being inaugurated.—ED.]

The Scarcity of Skilled Labour.

SIR,—Having read the article on the above in *The Builder* of the 14th inst., the following may indicate the seriousness of the shortage of skilled labour in the higher branches of joinery. A short time since I advertised for fifty joiners for airtight showcase work, and out of numerous applications I received there were only two I could entertain, and in consequence orders are delayed for weeks.

EDWARD VALE.

Weston-super-Mare.

Houses and House Agents.

SIR,—Referring to your article in last week's issue, I am unfortunately one of the large number of would-be home dwellers if houses could be rented. I have travelled miles and spent much money in fares travelling to see the few houses offered for rent.

The outlook is certainly not promising, and I do not think much help can be looked for from agents, for they naturally prefer to sell a house, as their commission is so much more.

I will not lengthen this letter by giving examples of agents' descriptions as compared with the reality, but one case recurs to memory where, going to see a much-belauded house, I found it overlooked a sewage farm, or another recommended as quiet which overlooked Brooklands.

As I hope some day to get a house I must remain anonymous.

"HOMELESS."

The Prevention of Dry Rot.

A correspondent writes asking for information as to the suitability of an acid dressing to stop rot.

Railway Improvements in Wales.

Schemes representing approximately an expenditure of £250,000 on the Central Wales section of the Great Western Railway have been put in hand. At Aberystwyth the station is being enlarged and the line doubled to Llanbadarn. The Forden-Welshpool extension is nearing completion. New works at Harlech Station, costing £10,000, are well in hand. Pwllheli Station has been remodelled, and Dovey Junction platform has been raised in preparation for a double line to Machynlleth. Oswestry Station is being enlarged at a cost of £61,000. About 500 Oswestry railway workers will meet shortly to discuss a proposal to build a garden city suburb at Oswestry in connection with the Great Western Railway Company's scheme to assist employees to build houses for themselves.

WITH THE A. A. AT AVIGNON.

(NOTES FROM OUR CORRESPONDENT.)

Avignon.

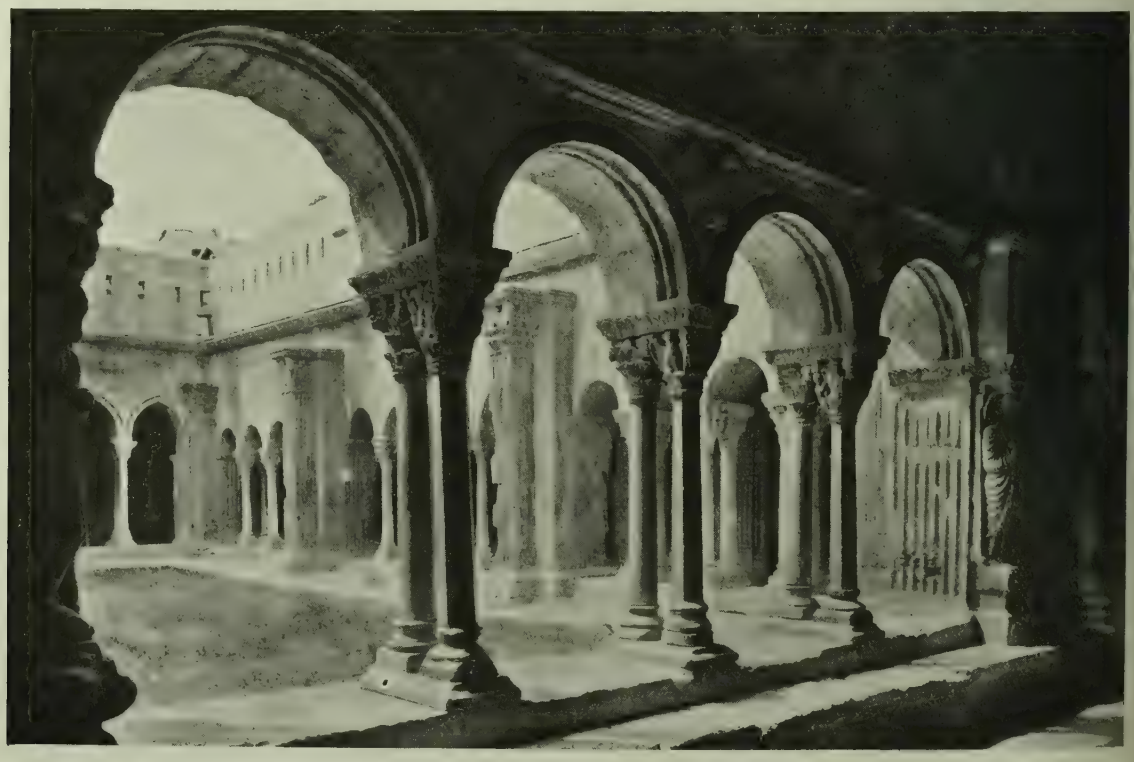
On Sunday, September 8, the members of the Architectural Association Excursion again took the opportunity of seeing the town of Avignon, and they were not disappointed. As it was Sunday and glorious weather, the population was mostly in the open air, and the animated, expressive features of the people, combined with the views of churches to be seen in narrow side streets and the unexpected vistas of sunlight and shadow silhouetted against the cloudless blue sky made a scene not readily to be forgotten. The women, one noticed, were generally dressed in excellent taste. After the Austrian bentwood atrocities to be seen in most English tea-shops, the café chairs favoured at Avignon are particularly pleasing; they are made of a cane framework, the backs and seats of which are interlaced with brightly enamelled split cane arranged to form different designs. As each café adopts a different colour for its chairs, these add considerably to the general air of brightness about the town, and one wonders whether the "Brighter London" enthusiasts could not find a better outlet for their energies in such small but everyday things as this rather than in glaring illuminated sky-signs, which seem to be accepted in many quarters as the best means by which London can be "brightened."

In the afternoon the party visited the local museum, into which one is almost unwittingly enticed by the wonderful display of pink and white oleanders in the courtyard.

Monday.

On Monday morning the party left Avignon for Arles, a journey of some twenty-five miles through long avenues of fine plane trees, olive groves, and vineyards. The peasants, in their blue smocks and trousers, gathering the grapes, the quaint mule-carts, the mules with their (to us) odd harness and jingling bells, were all objects of interest. The sight of these peasants working in the fields brought to the memory Millet's picture, "The Angelus Bell," and the works of the brothers Maris, and made one realise the sincerity and truthfulness of their work. On arrival at Arles, which is within 20 miles of the Mediterranean, many fine relics were to be seen. Amongst those visited was the Amphitheatre, one of the longest of the kind in France; it is about 500 yards in circumference; the longer axis is 150 yards, and the shorter 117 yards. This arena probably dates from the first or second century of our era. It possesses five corridors and 43 tiers of seats, holding 26,000 spectators. Of the two stories of 60 arches, the lower are Doric and the upper Corinthian. The Roman Theatre was also visited, and this also proved to be of great interest. This theatre is said to have been begun under Augustus, though it was not finished until the third century. Its destruction began in the fifth century, and much of the material was used in the construction of several churches. In front of the stage wall was a colonnade of which two columns remain standing, one of Affricano and the other of Carrara marble. The theatre was richly decorated, and numerout works of art found there are preserved in the Museum. The Venus of Arles, in the Louvre at Paris, was discovered here in 1651. Beyond the Theatre is a public garden.

The ancient Cathedral of St. Trophisme, which was also visited, is considered to have been erected on the ruins of the Roman prætorium and consecrated in 606. It has been several times rebuilt, and the choir was added in 1430, while the whole church was restored in the nineteenth century; it is in the Romanesque style, with a tower over the crossing. The portal is of the twelfth century and is supported by six columns (see illustration). A flight of steps to the right of the choir leads to the cloisters, of which our illustration will give an impression.



Two museums were also visited, and the Monastery of Mont Majeure on the hor ward journey. Lunch was partaken of at Hotel du Nord, in the Place du Forum, wh a fragment of the Forum may be seen.

Tuesday.

In brilliant weather a start was made Tuesday from the hotel, through magnific scenery, the golden-foliaged avenues of pl trees and hedges of bamboo making an pression not easily to be forgotten, to Pont Gard, where a stop was made to enable party to examine, sketch, or photograph vast Roman aqueduct. Many of the par including some of the ladies, ascended walked at a great height across the This great aqueduct, spanning the Gard Gardon at a bend of the valley, is one of most imposing monuments of the Roma which remain with us to-day. It forms part of the aqueduct built to convey to Nim the waters of two springs in the neighbo hood of Uzês, and is ascribed to Agrippa, s in-law of Augustus (19 B.C.). The bridge 880 ft. long and 160 ft. high, and is compos of three tiers, each less wide than the below (see illustration). The whole is wond fully constructed of large stones and no cem has been used except for the canal at the to

After lunch the party started for Uzês, a a halt was made to view the Châte d'Argilliers. It is sad to see the neglec state of the house (which is uninhabited) a grounds. At the entrance is a circular do cote (see illustration), which stands ami magnificent plane trees and presents a cha ing picture in golden hues. The châte pleasing in character, is of a late peri The property is in the market; the price as was between two and three thousand poun including wine presses and electric fittings.

On continuing the journey the party arri at the ancient town of Uzês. cathedral (17th-18th century) retains campanile (twelfth century), an impos Romanesque relic of an earlier church stroyed in 1611. The Hotel de Ville, a bu ing of the eighteenth century, was visited; it has a fine courtyard, bey

The Cathedral of St. Trophisme, Arles: The Cloisters.

hich stands the ducal palace, dating from the eventh, thirteenth, fourteenth, and sixteenth nturies, but it was largely restored in the neteenth century. After a ramble through e old town the party left for Avignon, a halt ing made to view another ancient monas-ry.

The roads were dusty, and little traffic was et beyond a few motor-cars and the quaint ule-carts.

Wednesday.

This was another brilliant day. The party ited Nimes, which was reached after a short lt at the village of Rochfort, through a ading ascent amongst the houses and their rdens, with figs and pomegranates growing ely. A curious method of drying the figs as noticed; they are impaled on a branch a thorny tree and placed in the sun to dry. ntinuing the journey, Nîmes was reached, hen lunch was partaken of at one of the merous café restaurants at a cost of 9 frcs. bout 2s. 6d.). During the afternoon the mphitheatre was visited; it forms an ellipse 5 yds. long by 111 yds. wide, and 69 ft. height. It is smaller than the Amphi-eatre at Arles, but the exterior is in better eservation. It is constructed of stones 0 ft. cube, all perfectly adjusted without ortar, like all Roman buildings of a large e. The exterior presents two stories, each 60 arches, the lower having huge square ttresses, the upper Doric columns, while ove this are 120 projecting stones pierced th holes in which the masts of the awning, hich covered the amphitheatre, were inserted. here were four external gateways at the tremities of the axes; 24,000 spectators uld be accommodated; 124 entrances afforded rapid means of ingress for this multitude. mbats with wild beasts, it is thought, could t have taken place here as the wall bound-the arena was too low. The construction tes from the first and second centuries of r era. It was transformed into a fortress the Middle Ages, and afterwards occupied hovels, of which it was not freed until 0. A restoration was begun in 1809 and other in 1899. The work is undertaken by French Government and is well done. ll fights still take place there.

The Maison Carrée was one of the principal ildings viewed. It is one of the finest and st preserved Roman temples known, and ms a parallelogram 76 ft. long by 40 ft. de and 40 ft. high, with 13 Corinthian umns, 20 of which are attached to the walls the cella. It is thus a pseudo-peripteral uple, prostyle and hexastyle, *i.e.*, it has a tico on the front only, consisting of six umns. It is approached by 15 steps. The umns are fluted and surmounted by a ital of superb workmanship. The entabla-e is very rich and, like the design, in nisite taste. It is believed to date back to time of the Antonines, *i.e.*, to the second tury. Successively used as a church, muni-al building, a warehouse, and a stable, this gnificent building has been well restored e 1824. It is now used as a museum and tains some fine objects of art.

The Jardin de la Fontaine, decorated eighteenth-century style, but in part laid on ancient foundations, was next visited. Temple of Diana is to the left of the foun-. Other buildings were inspected, and r a pleasant and highly interesting day the rn journey was made.

Thursday.

Thursday the quiet old town of Tarascon visited, the journey taking the party ugh interesting old villages, with many nt objects *en route*. Tarascon is on the bank of the Rhone opposite Beaucaire. is said to derive its name from a monster Tarasque, who ravaged the country in rst century and from whom it was de-d by St. Martha; a fête is occasionally in commemoration of this event. The buildings inspected included the Church of St. Martha, which was founded in the twelfth century and rebuilt in the fourteenth-fifteenth century. This church has a fine Romanesque south portal, and contains many paintings attributed to Vien, Parrocel, and Vanloo, etc. In the crypt is the tomb of St. Martha, which has been restored. The Gothic Castle is of the fourteenth and fifteenth centuries, and is a remarkable pile with an interesting interior; King René of Anjou, Count of Provence, completed the building, which is now used as a prison, and resided there. From the Castle the journey was continued to Beaucaire, and the various objects of interest inspected, after which the party returned to Avignon.

Avignon Cathedral: Interior.

Friday.

The last of the official trips took place on Friday, and was arranged by Mr. Yerbury (Secretary). The route was again through numberless vineyards, with the black grapes hanging in clusters behind the bamboo hedges which are used to protect the vines from the cold winds. The first stop was St. Remy, where one of the objects of interest is the Triumphal Arch, which, though not large and with but one arch, is excellently proportioned, and still shows remains of fine ornamentation and sculptures representing captives; it dates from the first or second century. A mausoleum, called the tomb of Julii, from the inscription on the architrave, is close by. Pyramidal in form, it is nearly 60 ft. high, and consists of three stories with a square base, with bas-reliefs on one side representing hunting scenes, and battles on the other three sides. Above this is an arrangement of porticos and fluted columns, finishing with a small round temple, with ten fluted columns, on which are two draped statues. The details in general are good, but the proportion of the structure is unfortunate.

Within a short distance is the Cloister of St. Paul, which well repaid a visit. The courtyard within contains finely-foliated trees and flowers, presenting a peaceful sight.

Continuing the journey up mountainous and twisting roads, the mountain vegetation presented glorious harmonies in grey greens, browns, and golden hues. Huge stones are placed on the roadside to prevent vehicles falling into the ravines.

Lesbaux, an ancient but decayed fortress, contains many picturesque and remarkable objects. It surmounts the top of a rocky height not far from where the Alpines begin to rise from the plain of the Rhone. Formerly a considerable fortified fortress, it is now a deserted but romantic spot. A few inhabitants till the soil in the valleys, where olive trees abound and wild pigs thrive amongst the ruins. Although little more than a gigantic heap of ruins, some façades of good Renaissance design are still to be seen in the silent streets. The interest here is inexhaustible, and one ponders over the ruins in sheer amazement.

Sunday.

Sunday brought the excursion to an end, and a last look round was indulged in. Endless quaint courtyards, squares, and interesting old doorways were discovered; and last photographs taken of the picturesque subjects full of colour, sometimes brought about by a line of washing hanging from the window or a seated figure in some bright garment in the sunlight or shadow. So ends a pleasant and an instructive holiday, new to many and none the less pleasant to the old travellers.

The thanks of the excursionists are due to Mr. Yerbury for the choice of Avignon as a centre, and the able arrangements made for the comfort of all, everything passing off satisfactorily.

THE SCULPTURE AND TERRACE.

[View of the garden looking towards the causeway side of the arch cut in the old wall, showing the monument set in the wall close to the spot where the scaling ladder was placed. The balustraded terrace forms the view point about 40 ft. distant across the moat. Both the garden and moat are planted with New Zealand flora. In the foreground is the entrance to a communicating tunnel converted into a rockery and on the left is the edge of the dam on which the ladder rested.]

Le Quesnoy Memorial. MR. S. HURST SEAGER, F.R.I.B.A., Architect. (*See p.* 441.)

LE QUESNOY MEMORIAL.

The choice of Le Quesnoy as the site for of the New Zealand battle memorials ided the architect, Mr. S. Hurst Seager, an opportunity of demonstrating the tiveness of the right combination of l beauty and monumental sculpture. It pened that on November 4, 1918, the 4th the 2nd Battalions of the New Zealand e Brigade were assigned the task of taking walled town of Northern France. The Zealanders were held off by machine- s for the greater part of the day, but tually, under cover of a barrage of Stokes tars, rifle grenades, and Lewis gun fire, 4th Battalion were able to place a scaling ler against the high ramparts and mount essfully to the parapet. The incident was only one of its kind during the whole four rs of war, and it was decided to incor- ate a representation of it in the monument. as the taking of Le Quesnoy, with its German defenders, marked the closing on of a long series of triumphs which ex- ded over eight months, and also the end of war for the New Zealand Division, it was ded that the memorial should not only be honour of those who had fallen in the acent battlefields, but a fitting emblem of orious peace.

There are other walled towns in France, none so picturesque as Le Quesnoy. The er and outer ramparts, with their project- salients, and the detached island bastions n a veritable labyrinth, and the moats, overgrown with weeds and rushes and ter-lilies and great timber trees, seem to e their way between the towering battle- nts. The ancient brick walls themselves beautiful. Here they are silver-grey, rging into red and brown, and again kening into purple, and ever varying with position of the sun. The parapets of the ls and the island bastions are thickly ded, and still beyond the fortifications re is a wooded area which has been largely to Nature.

The possibilities of an effective memorial re immediately evident to Hurst Seager. He de- d that it should take the m of a marble plaque set the face of the battlement r to where the scaling er was originally set up. in front of this point is one he island bastions, and he eived the idea of making a garden from which the ue could be viewed. So far was satisfactory, but having ded that the memorial should utside the walls of the city, e was the question of accessi- y. In the Place d'Armes in centre of the town there ds an archway which gives ss to a ruined château, once home of Queen Marguerite Bourgoyne. Passing by the eau one comes to an avenue rees which runs along the side of one of the battle- s, and so on to a projecting nt. The salient itself over- the island bastion, which now been transformed into New Zealand garden. Here he solution of the problem. the approval of the town orities a pathway was laid ith this avenue of trees, an way was made in the wall of alient, and a causeway built s the moat to the island. pathway along the battle- s has been named by the French " Avenue d'Honneur Neo-Zelandais," and over the chateau arch is a plate with that name engraved thereon.

Every 10 ft. throughout the whole length of the fortifications there is a projecting buttress on the inner side—not visible because the grass slopes mount upward to the top of the walls. But a cutting was made, and two of these buttresses disclosed. Between these is the new archway. Such new brickwork as was necessary was made to conform as much as possible to the picturesqueness of the ancient masonry, and by treating all the bricks with certain chemicals an appearance of uniformity of age has been acquired. Over the top of the archway is a tablet bearing the inscription " Le Jardin des Souvenirs."

Entrance to the Avenue d'Honneur.

All the earth taken from the cutting has been utilised to form the causeway across the moat to the island site, and the sides of both the causeway and the cutting have been turfed. The island was already a beautiful spot, but for a year or more the staff of the Imperial War Graves Commission have been converting it into an ordered garden, though much of the original vegetation was left. This and the flowering shrubs and rock plants merge pleasantly into one another. To the New Zealander no sight could be more welcome than the veronicas, the olearias, the red manukas, and other plants from his far-off home. Down in the moat beside the clear rippling stream the New Zealand flax and toi-tois are flourishing as well as if they were growing on their native hills. Over all are the stately poplars, the elms, and pines.

A simple marble balustrade overlooks the memorial plaque 40 ft. across the moat. Just a few yards to the left of the plaque is the place where the scaling ladder was set on that eventful day in November of 1918. On the inner side of the balustrade wall are the words, " From the uttermost ends of the earth," and in French, " De l'autre extremite du monde." From this vantage point one may look directly upon the monument.

One's only regret is that so few people whose interest in it is greatest will ever see it. Mr. Seager's idea was to include in the sculpture the wall-scaling incident, but this was overshadowed by the greater idea of triumphant Peace. The war scene was modelled by Mr. A. R. Fraser, a New Zealand sculptor, whose work has appeared in the Royal Academy on several occasions. Mons. Felix Desruelles, a French artist of note, undertook the work in marble. He has reproduced exactly Mr. Fraser's scene, but the figure of Peace carved on the more prominent plane of the marble block is his own conception. At no time is the light in the eye of the spectator. At midday the sun casts deep shadows on the statue, and in the evening the rose of the sunset gives still greater life to the marble figure of Peace.

It is necessary to spend some time alone in this Garden of Memories to appreciate to the full its beauty and its peacefulness. On a summer evening no place could be pleasanter. With its convenient and beautiful approach it will always be the natural goal of those who seek a few moments of peace and quietness. Here, indeed, have Nature and Art combined to make a thing of surpassing beauty.

T. J. Pemberton.

ILLUSTRATIONS.

Bishop Tucker Memorial College.

The illustration of the Bishop Tucker Memorial College, Mukono, Uganda, is from the design of Professor Beresford Pite, F.R.I.B.A. Our illustrations are from this year's Royal Academy Exhibition.

Pavilion at Prestatyn, North Wales.

This pavilion has been designed as part of a scheme now complete, which includes a bathing pool, arcades and bathing cabins, and it faces the pool across a paved courtyard. Large French windows give access to this from the hall, 70 ft. by 40 ft., which is used for entertainments and dancing, and as a café. The accommodation includes a platform with dressing-room accommodation, kitchen and services, and male and female lavatories.

The walls are limewashed externally and the roof covered with grey-green slates, while internally the finish is distemper on brick covered by treillage. The open roof exposes the built-up roof trusses, which, with the treillage, are decorated in a colour scheme of blue, green, orange, and black; the whole effect aimed at was one of simplicity with the gaiety suitable to such a building.

The general contractors were Messrs. Roberts & Sloss, of Liverpool and Prestatyn. The roof trusses were supplied by Messrs. Freeman & Co.; treillage by Messrs. J. P. White & Co.; artificial stone by the Croft Concrete Co.; slates by Roberts, Adlard & Co.; ironmongery by Robert Adams & Co.

The architects are Messrs. Easton & Robertson, of 7, Gray's Inn-place, Gray's Inn, W.C.1.

White's, Christ's Hospital, Horsham.

This new master's house is named after Mr. F. A. White, J.P., the late treasurer and a generous benefactor, and is situated on the south side of the Western avenue. It represents an attempt to obtain by simple planning and construction a house of enduring material at a reasonable first cost, and which involves practically no outlay for maintenance. The walls are formed with two 4½ in. thicknesses of brickwork, with a 1 in. cavity filled with White's hygeian rock composition. By carrying this composition under the surface concrete the house becomes a completely watertight and insulated tank. The roof is covered with Collier's hand-made tiles, and the walls have Daneshill facings with Weldon stone dressings.

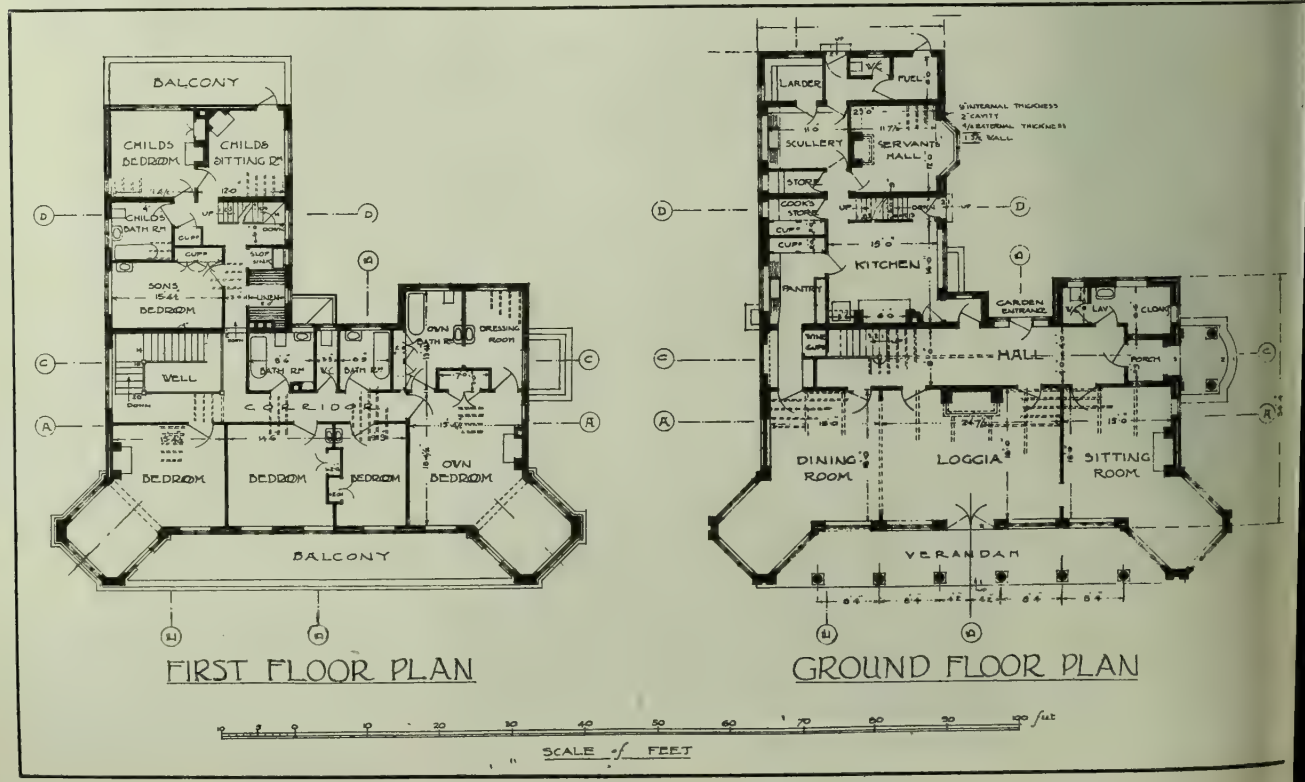
Mr. George Alexander carved the heraldic panel on the door. The metal casements and lead lights are by Messrs. Welstead, of Croydon. The oak doors have wrought-iron strap hinges and furniture by Messrs. F. G. & S. H. Frost, metal craftsmen. The sanitary and domestic plumbing and drainage work is by Messrs. Durbin & Katesmark. The general contractors are Messrs. Walter Lawrence & Son, and the architect is Mr. Sydney Tatchell, F.R.I.B.A., the Surveyor to Christ's Hospital.

Proposed House at North Foreland, Kent.

The ground plan is "L" shaped. The hall is entered from the north end from an inside porch and outside portico. The hall extends practically the full width of the house. On the right of the entrance are cloakrooms, with lavatory accommodation, etc. The principal stairs occupy the opposite end of the hall. On the left of the hall from the entrance and facing the sea is a spacious central logg with dining and sitting rooms on either si each having large square angle bays, w windows on three sides. The loggia dining-room may, by means of a folding pa tion, be converted into one room, 40 ft. 18 ft., irrespective of the angle bays. loggia gives on to a verandah extending acr the entire sea frontage (60 ft.) on the grou floor, and has a flat roof, forming a balco upon which the principal first-floor bedroo give.

The elevations are to be in brickwo ashlar stuccoed, and to be painted whi The roof is to be covered with red Marsei tiles. The design is of the simplest, but colonnade of six Doric columns, with coup Doric pilasters at either end, and the entab ture and open balustrade to first-floor balc have all the characteristics of the Riviera vi This is accentuated by the doors and windo looking on to the verandah having circu arches.

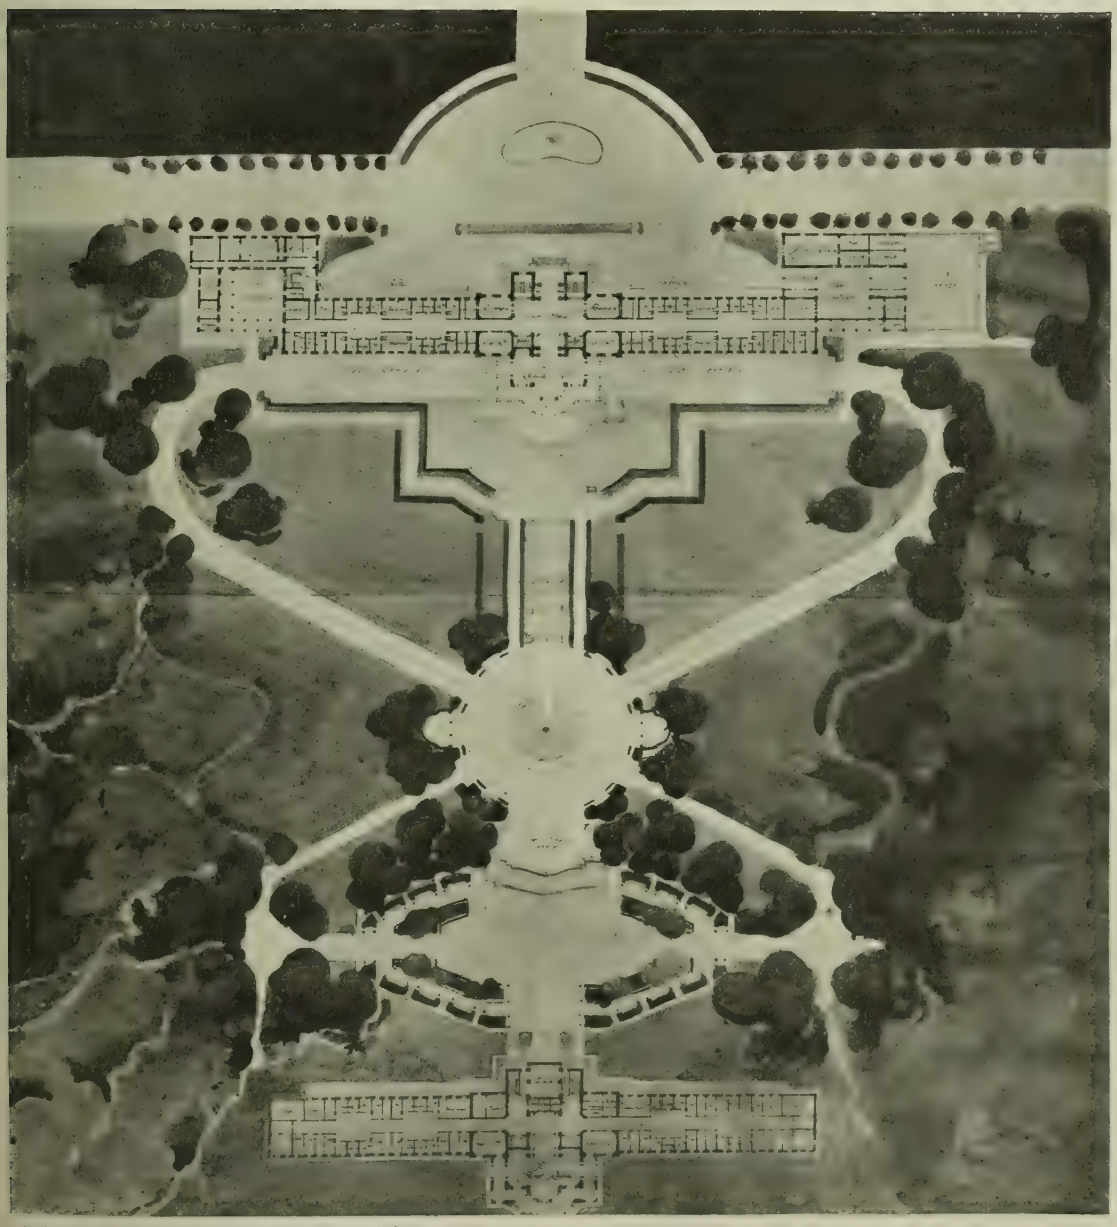
The architect is Mr. C. F. Skipp F.S.A., Lic.R.I.B.A., F.R.S.I., F.I.A., 64, St. Andrews-street, Cambridge.



St. Augustine's Parsonage, Tooting Bec, Surr

This illustration—from a pencil drawing the architect—is of a small parsonage house be built upon a corner site, another portion which is reserved for the permanent church St. Augustine, Tooting, from the designs of H. P. Burke Downing, F.S.A., of Westminst The estimate of the builders, Messrs. G. P. & Barnes, of Streatham, is £2,800.

Church of St. Martin, Llay, Gresford.



This church is to be built in a new garc village formed to house the employees of a la colliery. When completed it will accommod 500 persons at a cost of about £9,000. walls are to be faced inside and out with ro Llay Hall bricks 2½ in. thick, the window dr ings being of Runcorn stone. The inter arcade is to be of timber. No contract has yet been let, but it is hoped that a start shortly be made with at least a portion of church, and that it will be the first new chu to be built in Wales since disestablishment.

Mr. R. T. Beckett, of Y Bryn, Trydd near Mold, is the architect.

Proposed House at North Foreland, Kent. MR. CHARLES F. SKIPPER, F.S.A., Architect.

THE DOME: ITS HISTORY AND CONSTRUCTION.—IV.

By SIDNEY TOY, F.S.A.

With the revival of Classic forms in Western Europe during the fifteenth century the building of domes received a fresh impulse. The dome over the crossing of the Cathedral of Florence, built 1420-61, is a masterpiece of scientific construction (Fig. 33). This dome springs from an octagonal drum, retains the octagonal form throughout, and rises rapidly on the curve of a pointed arch to an eye 19 ft. wide. The eye is not allowed to remain open, as at the Pantheon at Rome, but is covered by a lantern, an arrangement which was extensively followed in later Renaissance buildings. The base of the dome, to a height of about 10 ft. above the springing line, is composed of solid masonry, about 14 ft. thick. Above this the structure is divided into two shells by a space of 4 ft. for the first 15 ft., and of 6 ft. for the whole of the distance beyond; throughout this greater portion the inner shell is 6 ft. thick, and the outer 3 ft. at the base, diminishing to 2 ft. at the crown. The lower parts of the shells, to a height of about 40 ft. from the base, are built of masonry, while the remainder is of brick. These shells are connected by solid stone ribs, one at each angle of the octagon, 9 ft. thick at the bottom, diminishing to 2 ft. at the top, and two between the angles, about 5 ft. thick at the bottom and 1 ft. 7 in. at the top. The ribs extend through the full thickness of the dome, and are connected at intervals by cross arches, as in Fig. 34, which shows one face of the dome with the upper shell removed. Two stone galleries running round between the shells assist considerably in consolidating the structure, which is further secured by iron girdle chains, embedded in the masonry 14 ft. above the springing line, and a heavy chestnut girdle, strongly fished at the junctions, placed about 28 ft. above the springing line. In this dome an attempt is made to overcome the effect of lateral thrust within the perimeter of the dome itself, and that object is largely accomplished by giving the structure a beehive form and by the insertion of girdle ties at the levels where the thrusts are most severe.

The dome of St. Peter's, Rome, built during the latter half of the sixteenth century, is also surmounted by a lantern, and is composed of two brick shells connected by solid stone ribs (Figs. 35 and 36). The base of this dome is circular, and the shells are nearly hemi-spherical in form. The space between the shells is not of uniform width, as at Florence, but increases during the ascent from 2 ft. 6 in. to about 8 ft. Equally spaced round the dome are sixteen stone ribs, which extend across the space and through the full thickness of both shells, and have a thickness of about 9 ft. at the bottom, diminishing by offsets to 3 ft. at the top. There are no cross arches between the ribs,

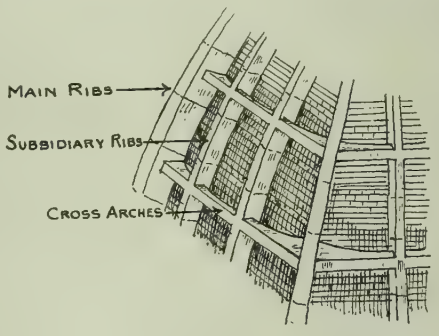

Fig. 34.

as at Florence. At the haunches, where the lateral thrust would be most severe, three iron chain girdles were embedded during the progress of the work. The lateral thrusts are here deflected vertically in the dome itself by the arrangement of the two shells, the upper shell having its axis raised con ably above that of the lower. The t are also met by sixteen heavy buttr placed round the drum in positions sponding to the great ribs of the (Fig. 36), and are restrained by the girdles mentioned above. That the des defective and the precautions taken i cient to secure the safety of the struct evidenced by the fact that in 1742, 150 years after its erection, very s cracks were discovered to have develop the dome, and six other chains, one a base of the drum and five at various h in the dome itself, were subsequently to strengthen the work.

The architects of this later period those of the Middle Ages, endeavour solve the problem of securing both in and external effect, and a development i direction occurs in the largest of th domes over the church of S. Maria Salute, Venice, built 1631-56. Here the consists of two distinct parts, the lowe

Fig. 36.—St. Peter's, Rome.

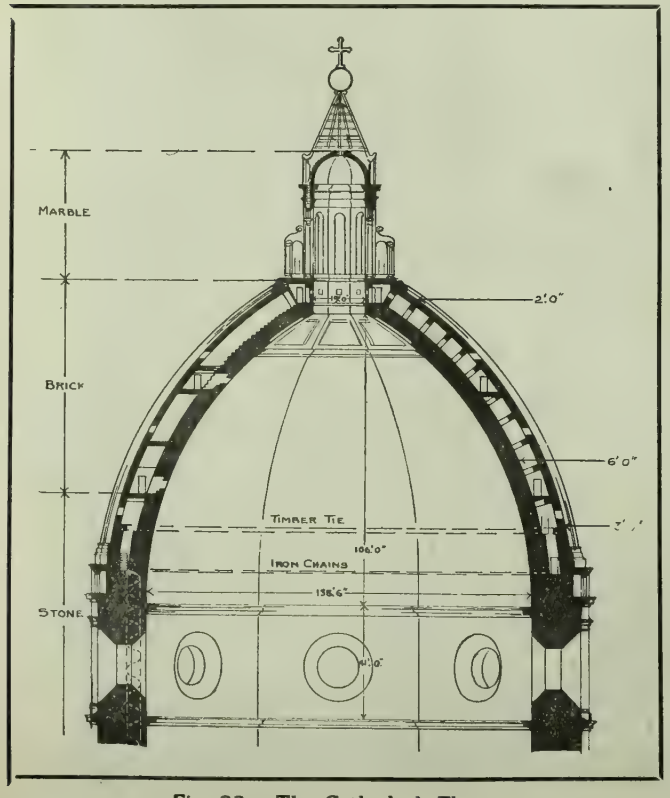

Fig. 33.—The Cathedral, Florence.

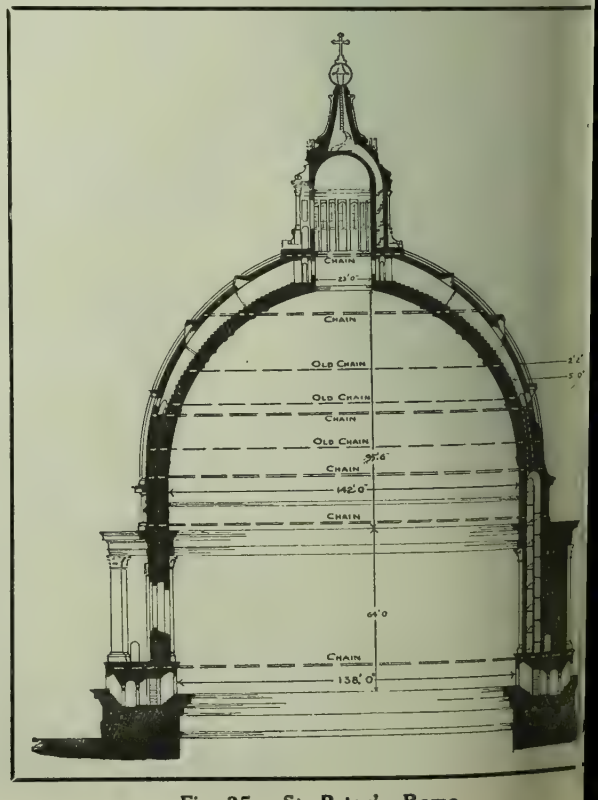

Fig. 35.—St. Peter's, Rome.

hich is exposed to the church, being ctural member, while the upper part, y from the exterior, is built of timber- The outer cupola is raised considerably ie other, and thus, while the external ice is greatly enhanced, effective pro- s afforded to the dome proper.

ome of St. Paul's Cathedral, London 7), erected about 1700, is built on a ndrical drum which inclines inwards es, and is supported over an octagonal eight piers with round arches and ves. A peristyle, raised on a lofty encircles the drum, and is connected by thirty-two buttresses. This not vides the vertical pressure requisite t the lateral thrust of the drum itself, adds considerable dignity to the effect of the whole structure. From of the drum spring two shells, one, a slightly elliptical form and an eye rown, being the cupola exposed to the while the other is a conical structure om the haunches of the cupola and ng a stone lantern at its apex. The f the cone, with its decorations, is en from the interior of the church the eye of the cupola. Both these e of brickwork, 1 ft. 6 in. thick, but ring from a base of Portland stone, is embedded a strong double iron nd six bands of stone, each contain- ron chain, engirdle the cone at various in its height. The base of the cone cted with an attic wall, surmounting m, by thirty-two stone buttresses, ft. thick, and upon these buttresses stone corbels in the cone itself rests er framework of an external cupola, covered with oak boarding and lead. e is lighted by windows which pierce its crown and the summit of the cupola, and are so constructed as to

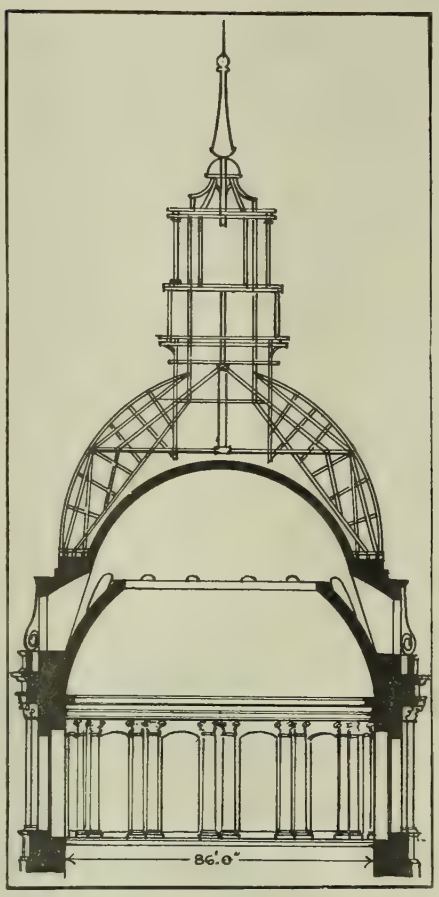

Fig 38 —Dôme des Invalides, Paris.

leave the contour of the cupola unbroken and to be obscured from observation from the street level. The space between the cone and the external cupola is lighted by elliptical holes in the cone.

The scientific manner in which the lateral thrusts are here received and deflected in a vertical direction by the use of the smallest amount of material places this dome among the most skilfully built structures in existence. The thrusts of the lower cupola are received at its haunches—where they are most severe—by the combined weight of the cone with the lantern it supports and of the external cupola, the latter resting on the cone and the cross buttresses at its base. The cone itself is rendered rigid by the chain ties engirdling it and by the weight of the external cupola on its outer surface. Tendency to spread at the haunches is further resisted by a strong double iron chain and by the buttresses surrounding the drum; while the drum itself, in order to receive the deflected but not quite vertical pressure, inclines inwards as it rises. The surrounding peristyle finally neutralises the lateral thrust.

The dome over the Dôme des Invalides, Paris, built in 1706, is composed of three distinct parts (Figs. 38 and 39). The lowest shell is entirely open at the crown, and simply forms a screen for the windows surrounding the drum of a secondary dome. The whole crown of the latter is thus exposed to the interior, and the paintings by which it is embellished are flooded with light by windows, themselves obscured. The third shell is of timberwork covered with lead. At the Pantheon, Paris, built 1775, the dome consists of three distinct shells, all built of stone. The lowest shell is exposed to the interior and has a large eye, through which the paintings on the intermediate shell can be seen, the paintings themselves being lighted

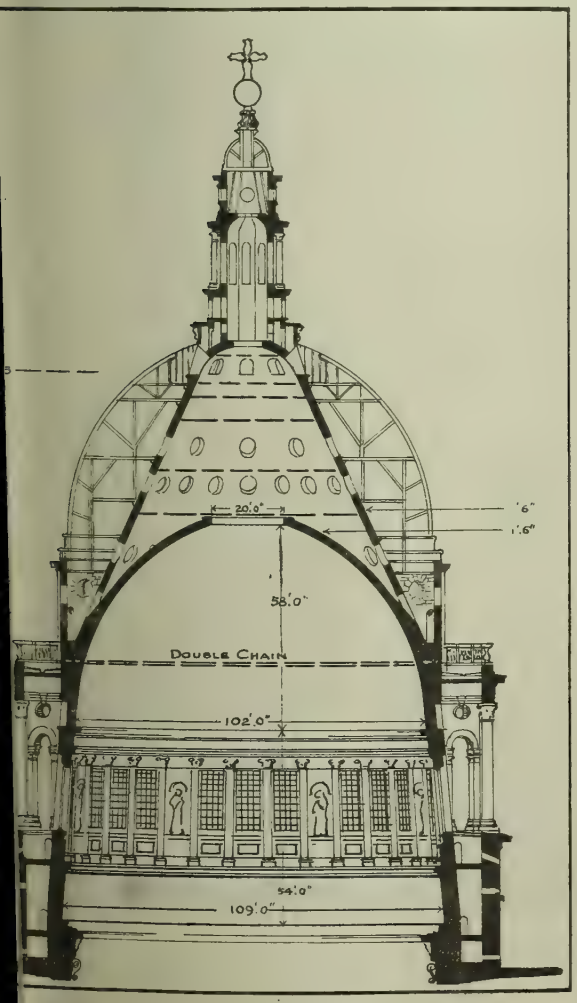

Fig. 37.—St. Paul's, London.

Fig. 39.—Dôme des Invalides, Paris.

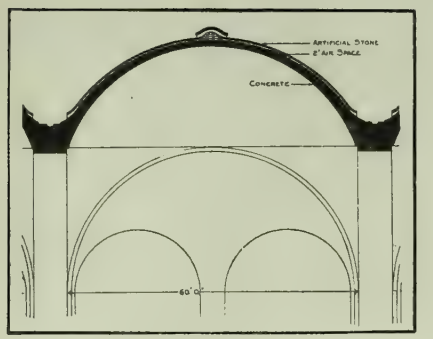

Fig. 40.

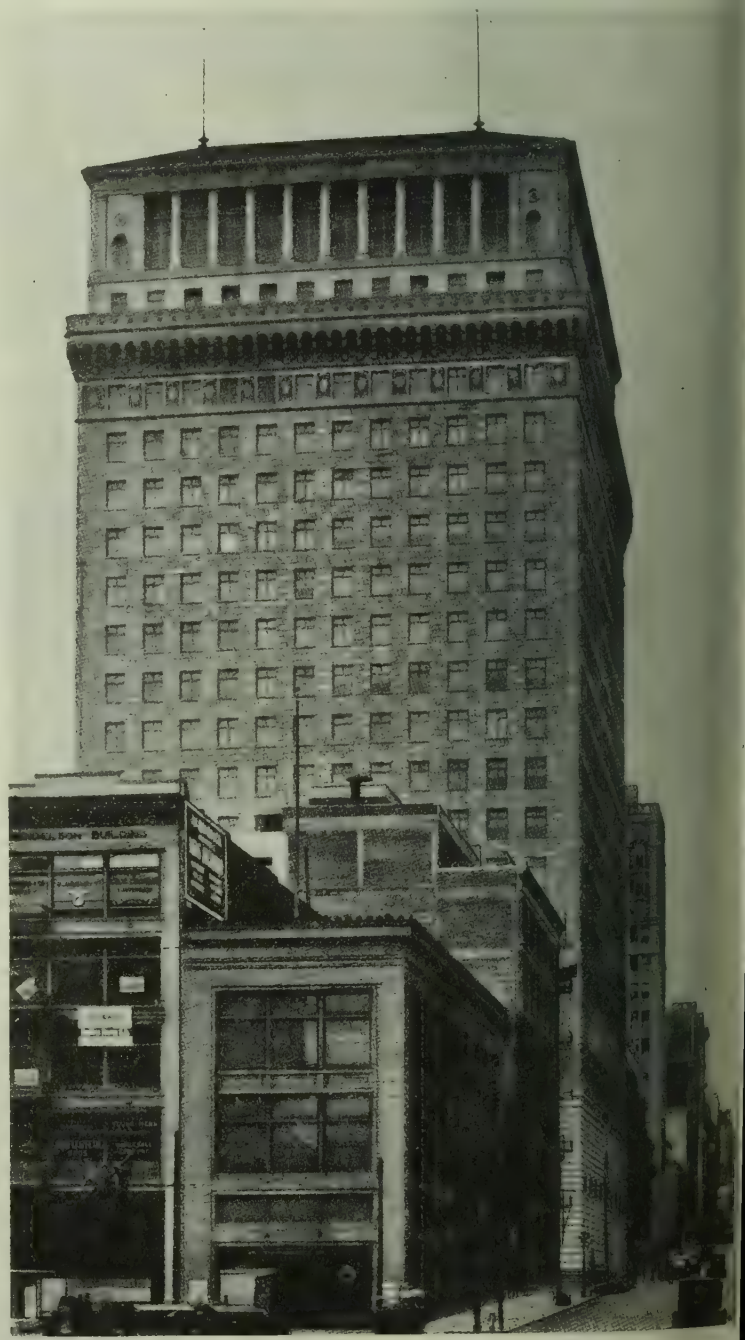
by a secondary drum. The outer shell is carried on this secondary drum, and is held firm by a stone lantern, the lantern itself being supported mainly on the intermediate shell.

It is obvious from the above analysis that the construction of domes in brick or stone was a work requiring considerable skill and involving great expense. Timber used alone was unsuitable for large domes on account of the heavy scantlings necessary and its great liability to destruction by fire, but the experiment was made in 1783 at the Halle au Blé, Paris, where the central space, 135 ft. diameter, was covered by a timber dome. This structure was burnt down in 1802, and replaced nine years later by a dome of cast and wrought iron framework. From this period iron, steel, concrete, and reinforced concrete have been used extensively for this work. The dome of St. Isaac's Cathedral, Petrograd, built about 1850, is constructed entirely of iron on a design similar to that of St. Paul's, London. Here the cone and lower dome are composed of heavy cast iron stanchions, and the whole structure is ponderous and crude. The dome over the Capitol at Washington, finished 1873, is also based on that of St. Paul's, and is of cast and wrought iron, but in this case lattice girders are employed, and the work is executed with considerable scientific skill. In 1855 the reading-room of the British Museum, 140 ft. diameter, was covered by a dome of brickwork with iron ribs. Two air spaces are provided, one between the dome and the external copper covering, to modify the effect of the difference between the external and internal temperatures; and the other between the dome and an internal ceiling, to provide a chamber for the extraction of the vitiated air.

At present concrete, either in a pure state or reinforced by steel, is much used in dome construction. The low cupolas over the nave of the Roman Catholic Cathedral, Westminster (Fig. 40), are composed of concrete, 3 ft. thick at the base, diminishing to 1 ft. 1 in. at the crown. They are protected from extremes of temperature by a thin external covering of artificial stone, with an air space of 2 in. between the covering and the concrete, the covering being supported on ribs. These cupolas, which have an internal diameter of 60 ft. and a rise of 22 ft., were constructed on timber centering built up from the ground. One of the most prominent examples of recent years from a constructive standpoint is the dome over the Central Hall at Westminster. This is composed of two shells. The lower shell, a saucer-shaped cupola 80 ft. diameter closed at the crown, is of reinforced concrete. The outer dome, rising at a much greater height from a plan almost square in shape but with chamfered corners, is built of light steel framework, with boarded surfaces and lead covering.



Many of the problems of dome construction with which the builders in all ages were faced still await satisfactory solution. The use of concrete, or even of ferro-concrete, is not modern, though the development of the latter on more scientific principles is a great step in advance; but the all-important problem of acoustics remains yet unsolved, while the attainment at once of good external and internal effect has been only partial. Though such domes as those of St. Peter's, Rome, and St. Paul's, London, have greater dignity when seen from without, no product of the Renaissance or of modern times has reached, or even approached, the exquisite beauty of the dome of St. Sophia at Constantinople as seen from within.

THE MALVERN HILLS.

THE Hon. Secretary of the Malvern Field Club, in a letter to *The Times* on September 15, called attention to the quarrying operations being carried out on the Malvern Hills and the damage resulting, particularly on the Worcestershire side, and stated that the attention club and the Malvern Geographical Soci been directed to a paragraph on the which appeared in *The Times* of the 11th

In *The Builder* for May 22, 1909, w attention to this subject in connection action brought by the Conservators Malvern Hills against the Lady of the and her lessee to restrain defendants fr figuring the hills by quarrying operatio the action failed, as it was held that th been no breach of the conditions impo Act of Parliament and a sufficiency of had been left to the commoners and the ants were acting within their rights.

The disfigurement of the hills, wh Malvern's chief asset, is now certain marked, and we can understand the named societies being concerned abo future. Our present object is merely t the attention of those concerned to the li which took place in 1909.

XHIBITION NOTES.

CHE VICTORY SCHOLARSHIP.

problem set in the final competition for tory Scholarship of the Society of Archi- sent in August 27) was a hydropathic hment set on high ground overlooking y in which are medical springs. There be a main building, an administration g for manager and senior staff, a pump nd a garage. The lower portion of the s was to be used for grottoes, tea rooms, d paths were to be arranged with easy ts for invalids and bath chairs. The nodation was to be provided for sixty male ty female patients, with dressing and treat- ooms in convenient proximity; recreation, on and reading rooms common to all, the first floor residential accommodation nursing staff. The competition drawings view on the first floor of the Society's g in Bedford-square. The Victory rship is of the value of £100 and carries a gold medal. The money must be used ancing the professional education of the in a manner to be approved by the jury. ompetitor who deposits a complete and ed design will be paid five pounds and a voucher of exemption in the subject nitectural composition and design for ciety's examination in architecture and ion to the First Atelier of Architecture. response to the competition has been one. Some of the drawings are excellent ity. The problem is obviously best solved designs of the winner, (No. 124), and 5, 135 and 130. We are glad to note the and sensible treatment of the designs to we have referred. Whether such a scheme would be wholly acceptable to the manage- f a hydropathic establishment we cannot t the plans show good appreciation of the n. In the design No. 135 the provision of is a good feature. The winning design interesting and effective central feature, e whole scheme is dealt with in a broad nsible fashion. The author of No. 130 is to mended for his careful working out of features. This competition should have in showing what can be done in a subject kind for a pleasing result without any overloading of features or ornament. as we may wish to see tradition and style overboard, it is satisfactory to see ts whose aim is to produce simple, sensible ent of masses and details without an on of "style" in orders or details. In spect such a competition as the above is aging and hopeful.

Students' Designs.

Exhibitions of Exemption Designs are this week. Those at the A.A. are designs ted by students exempted from the Inter- e Examination of the R.I.B.A. Until Wednesday the designs which exempt s from the Final Examination (with the on of Professional Practice) are exhibited University of London Bartlett School of cture in Gower-street. The A.A., the ol University, the Glasgow School of cture, and the Robert Gordon Technical at Aberdeen are represented.

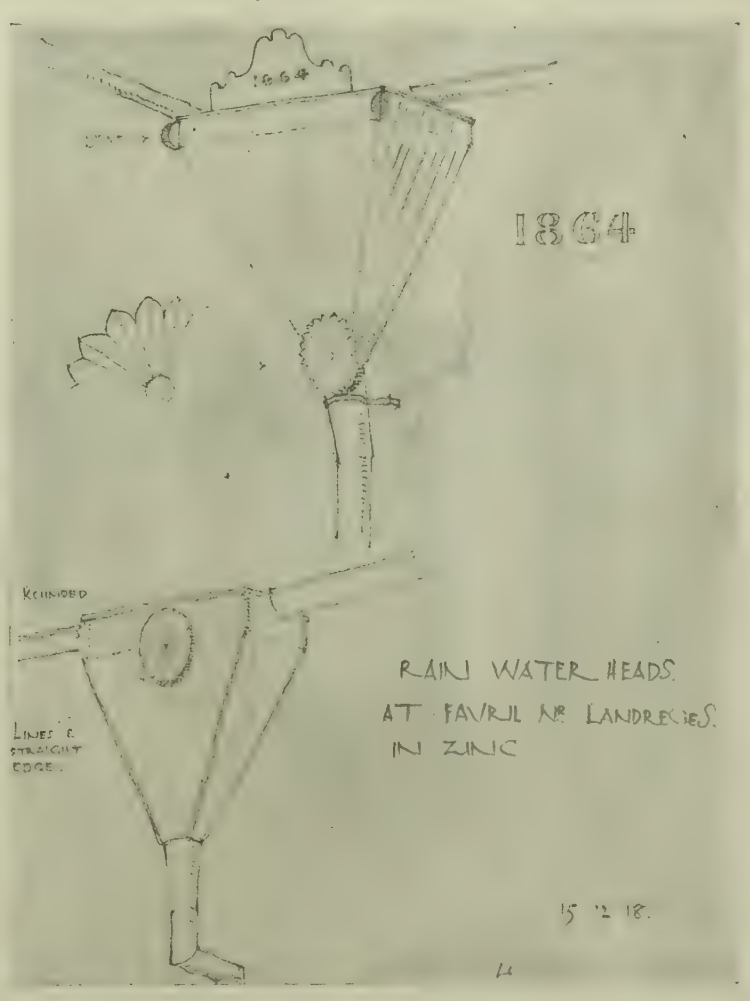
e London University three galleries are to the exhibition of the students' —on the ground and two upper floors. gst the first and second classes of the ctural Association is a good scheme for a establishment by Mr. G. Jellicoe. In h year work Mr. G. Crickmay has a ious design for a Repertory Theatre and lesigned bathing establishment. In the ear first class Mr. C. Hyslop has some oloured designs of a seaside bathing ment with a very telling and effectively l elevational treatment.

e Liverpool University section Mr. E. a collection containing some excellent ncluding a bridge, lakeside restaurant, &c. Mr. H. Hirst is best in his Kursaal design. In his Document Warehouse Mr. D. Brooke shows some commendable quality. Mr. Raafat's Mosque design shows considerable ability. A large amount of careful labour is seen in Mr. C. Hutton's Repertory Theatre drawings. None of the designs can be said to be distinguished in any special sense, but are most noticeable for their care and effort.

The Glasgow School of Architecture contributes some designs of which the best are the façade of a Royal Palace and a clever set of drawings for Municipal Buildings by Mr. J. C. Coia, and a Parliament House by Mr. J. Fergusson (better in its design than its presentation). Mr. T. Scott Sutherland (Aberdeen School of Architecture) is at his best in a Cinema design for a triangular site.

At the A.A. Galleries are some excellent drawings (from the Liverpool University) of a Lakeside Swimming Club by Messrs. N. A. Norbury, F.G. Fairhurst, Richard W. Briggs, and Elsie Rogers. A cinema and café by W. H. Owen; a theological college by J. Willis. Amongst a number of designs for market halls and designs for buildings round a circus one of the best is for the former subject by Sheelah A. Wilkinson.

The design for a Town Church by Geo. L. Walls (Edinburgh School of Art) shows decided promise in its large and simple handling.



From the Cardiff Technical College come some quite good drawings by L. Monroe and W. Thomas. A good sense of scale is seen in a Royal Naval College by Jas. Dowson (Aberdeen School). There are two or three subjects from the Cambridge University, Justin Vulliamy, and N. Pourlinson.

Very good drawings appear from F. P. Green, Leonard J. Young and another (A.A. School). The Modern Church designs are promising by A. G. Brodie, A Maxwell Allen, &c. An excellent set of line drawings are those for a workshop by S. D. W. Timmins (A.A. School). Some good pencil drawings by R. Courtney Theobold, C. W. Eve and M. A. Susson are sent from the London University.

Looking back over the exhibition referred to above we note a lack of freshness or spontaneity which we might look for if the students took a more real interest in their work. The standard which is allowed to pass design through for exemption is certainly not a high one.

Design for Gates at King's College, Cambridge.

This design (see p. 445) was awarded first prize in a recent competition, in which there were 28 competitors. The gates are to be presented to the College by Sir Charles Walston, who has been a Fellow of the College for more than 40 years, who, feeling that "paper-designing" was ineffective, and that each design should be organically connected with the purpose and structure of what it was meant to decorate, and especially with the material in which it was to be executed, and that the designer should be the craftsman, offered prizes for designs for the gates. The first prize was awarded to Mr. A. W. Elwood, M.I.S.I., art metal worker, of 119, Denmark-road, Camberwell, S.E.5, who is now making these gates; the second to Mr. S. Bowman, and the third to Mr. F. Adam. The designs submitted in the competition were judged by Sir C. Harcourt Smith, Mr. Watts (of the Department of Metal Work at the Victoria and Albert Museum), Mr. F. V. Burridge (of the L.C.C. Central School of Arts and Crafts), and the College Gates Committee, consisting of the Provost, Mr. Corbett, Sir Charles Walston, Mr. Shepherd, and Mr. Milner White.

FROM SKETCHES BY MR. STANLEY J. WEARING, A.R.I.B.A.

A HAPPY FAMILY.

WE have received the following communication from Mr. T. Sumner Smith, F.S.I.:—

The contents of *The Builder* for August 3 make excellent reading about those engaged in controlling and governing the building industry. But this reading gives one a disturbed and uncomfortable feeling. This particular issue seems to create this atmosphere, beginning with the leading article on "Noblesse Oblige," and ending with the paragraph "Architects and Builders," on page 194. Practically everything in this issue would seem to be in contradiction to the spirit of its leading article.

Is there something sadly amiss with those engaged in the building industry or are they merely trying to seek higher principles? Has our conduct been such, or is it such, that we require "codes" and the like to bring us to a frame of mind for truth and honourable dealing? "We should all like to feel," so you say in your leading article, "that the practice of architecture is altogether in the hands of those who reverence truth and fair dealing." Does this not imply that it has not been so in the past, nor is so to-day, and that the tendency but for this code would seem to be against it being so in the future. And is it not borne out by your statement: "The evolution of fine art should surely be of less importance to us than the true and honourable way in which we carry out our obligations. . . ."

The scramble for an existence, in which fees and profits are the goal, may tend to make us neglectful or careless of the consideration for others. Yet at heart all may be in agreement and admire: "The architect whose great aim is to leave behind him some impress of beauty in his buildings, whilst adding to the convenience and comfort of life. . . ."

In a general way the latter is not a sentiment in which the architect stands alone, but the opportunity to many for expressing it is unfortunately rare. How blest, then, the architect is that he may be able to do these things, fortunate in his calling or chosen profession, because, without doubt, they must add to his pleasures and interests in life. But should the work be its *only* reward, like the rest of humanity, the architect must live, and to live he must be remunerated for his work in the form of fees. These fees should be such as to enable him not only to live but also to enable him to achieve his aim and object. No reasonable being could take exception to this; rather he must approve and appreciate, for may he not as well as the rest of humanity benefit thereby? It might properly be argued and maintained that no one, whatever his abilities may be, ought to practise architecture who is not imbued with this desirable sentiment. Perhaps there may be some who might claim that this is not so much a sentiment as a vital necessity, for by its absence the architect may do incalculable harm. Proportionate to his power is his opportunity of doing good or evil. Which shall it be? But with that we need not dwell.

A point, however, of import is this: Is there an unwritten law that an architect should not practise architecture for a living, but rather practise art for its own sake? In my humble view, if this is so, then it is entirely wrong. To be a capable architect, or have the capacity or inclination to engage in architecture, it does not follow that one needs be blessed with any great amount of worldly possessions, but to undertake work for less than the usual and recognised fee, even when by the plausible excuse of practising art for art's sake, is an injustice to one's fellow-practitioners, and may be the means of keeping back a more capable but less fortunately placed person; probably may result in a great loss to the community. Ability should receive every assistance and help possible, and not be held in check and kept back. There is not a superabundance of this that we need waste it. Therefore, it is to be regretted that a code of professional conduct became necessary to curb and control those at the top as well as those at the bottom, and that no other means were devised—and perhaps more effectual—to achieve that object. However, it may be, as you say, "if we are to have a stable and secure civilisation we must set up laws and enforce obedience to them." Anyhow, we must have architecture, and if we are to have that we must keep an open door, admit all and sundry, no matter from what station of life they spring, so long as they conform to the rules and regulations laid down and approved of by the majority.

From a perusal of the article on "Building Examinations," by Mr. W. J. Stone, M.R.S.I., we may learn that the Institute of Builders are seeking to make a close profession in building by restrictive examinations, the spirit of which is totally at variance with their own principles: Competition, Enterprise, Industry. We must have builders, not necessarily contractors, but builders of the right kind to execute architectural works, and it does not follow that the sons and relatives of the present master builders will, of necessity, make the best builders of the future. Mr. Stone says, and rightly, that "Bookkeeping and accountancy are no doubt important, but not more so than the efficient training of craftsmen." Then he goes on to say, "In all too many cases the small profit is due to lack of scientific organisation and method." No bookkeeping and accountancy, however good, would remedy that.

The financial side of building to-day is probably too much overstressed by builders, and too little is made of the efficient training of craftsmen. As regards the latter, I am not here referring to the kind of "workmanship art" so forcibly put forward by Professor Lethaby as a means of restoring our sanity in building. The problems in building are more than proper bookkeeping and accountancy. "The object of true education," making use of Professor Lethaby's phrase in the same issue, "should be directed towards the manner by which these problems may be solved, which are, according to him, "so fully conditioned by data, facts, materials, and economics."

This question of commercialism—profit arising from building—is well exemplified by your paragraph on the "Standardisation of Buildings," on page 162 of the same issue, and the subsequent paragraph: "Levelling Down," which, taken together, may be taken to mean that, inasmuch as true craftsmanship has suffered by commercialism, the architect will be the next to suffer by absorption in the commercial house, taking his instructions "to design" to pattern. Quoting again Professor Lethaby: "Building is high activity, experiment, adventure, invention." It is possible to conceive that in the near future the architect may take little or no part in this — when "Henry Fords" take seriously to the business.

I would draw attention to page 182, a paper read by Mr. F. H. A. Hardcastle on the "Work of the Quantity Surveyor," which I deduce as being a comparison, say, between the "Crinoline and Bobbed Hair" periods in quantity surveying. However, there are, in addition to this, other points of interest, for, according to him: "The whole process of setting on foot a building enterprise . . . furnished an example of what they knew in physics as 'accelerated velocity.'" He tells us that architects are harassed in having to prepare the drawings quickly, the surveyor—well, having to work late hours at the office, and the estimator working overtime in the "Tube." Why is this—and for what? All for fees and profit? General Housing Memorandum (No. 64), with regard to fees payable to quantity surveyors in private practice for work—for reference, see page 183, Code of Professional Conduct. V, Noblesse Oblige, in which the chief prize awarded is fees. Bookkeeping and accountancy stands for profit. quixotic position created by the Ponty (Mon.) Master Builders' Association decli to tender for work as a consequence of a tectural work having been done at a red rate by someone not a member of the (a tectural) profession.

As a comparison with this "acceler velocity," let us examine the point mad Mr. Hardcastle in another sphere of the fessions. "When the solicitors on both had furnished their leisurely operations the land was conveyed . . ." Singul that on page 170, you give reviews of books on "The Law of Property Act, 19 which comes in operation on the first da January, 1925. Three years to mast their own class of work. Time eno surely, to write treatises on the subject, ever complicated, which may even then b us with its complications. Leisurely! is a word well worth noting. It took abo similar time to prepare the Standard Meas ment of Building Works, and are we n nearer? Mr. Hardcastle tells us that it received the approval of the Royal Insti of British Architects. That must be new the majority of the brethren of the pr sions. Why, then, the delay? Is the "snag" somewhere? Let us read on: remains to be proved whether there woul found in the trade sufficient solidarity public spirit to enforce its general app tion." The next flood may lift us clea the obstacle.

Building is high activity, experiment, ad ture, invention: There are two schools one, architects, surveyors and builders; in other, speculative builders, specialists, the like in building. The latter have, wi recent years, made vast inroads, and very much like swamping the former in near future; anyhow, they are the only who are really busy to-day and making gress. Is not the answer to all this t found in what Professor Lethaby says on 178: "I think an early step would joining up with builders, engineers, and c men in the common objective of refoundi human manner of building. What I sl really like would be a School of Building mon to the lot." Verily we are "A H Family."

The late Mr. Augustus W. Tanner.

MR. R. STEPHEN AYLING, F.R.I.B.A., ha the following notes on the late Mr. A Tanner:—The death of Mr. Augustus W. Ta occurred on August 4. Mr. Tanner, at the of his decease, had reached the age of 80 only retired from active professional work years ago. He was the oldest Associate o R.I.B.A. register, having been elected in

After serving his articles with Mr. Gil Craven-street, Strand, he entered the offi the late George Edmund Street, R.A., and as one of his principal assistants durin erection of the Law Courts. He after entered into partnership with Mr. Rom Walker, and, under the name of Rom Walker & Tanner, carried on private pr until 1896.

In 1883 he was appointed District Sur for Hatcham, under the Metropolitan Boa Works, and in 1896 for Rotherhithe, pa Camberwell, Hatcham, and St. George's-i East, under the L.C.C., when the acceptan this office rendered it necessary for hi dissolve partnership with Mr. Romaine-W He was again reappointed by the L.C. the district of St. George's-in-the-East in and retained that position until 1921.

Having acted as District Surveyor for thirty-eight years, he naturally had a knowledge of the old Building Act and its amendments. He had a keen sense of ju and in his official capacity held an equal ba between the letter and spirit of the law picturesque personality, quick to ange equally quick to forgive, an indefatigable w and a really good fellow has gone to his earned rest.

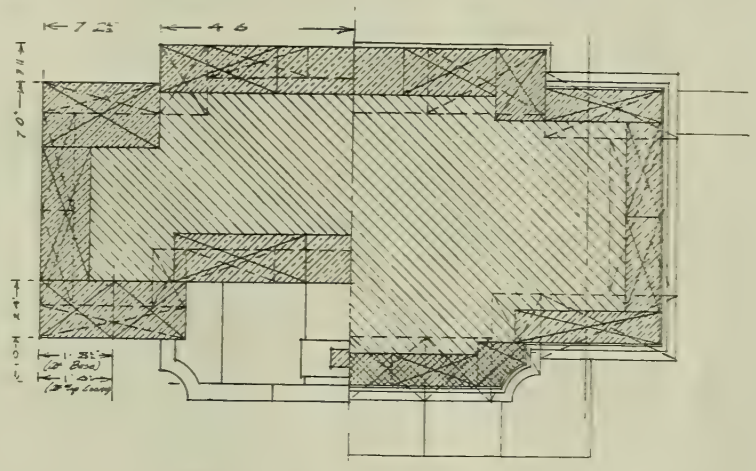
DEESIDE REGIONAL PLANNING.*

The area included in this scheme comprises, ghly, the shelving coastal strip forming the thern shore of the Dee estuary, and extends n Chester on the south-east to the Point of on the north-west. The district is at ent somewhat of an industrial derelict, and Dee estuary is so much silted up that, with ain reservations, it is a negligible factor the future industrial development of the ghbourhood. The main artery of com- nication through the district is, of course, London Midland and Scottish Railway line ch, running to Holyhead, follows the coast whole way from Chester to Bangor, while same strip of level coast land takes the main d which is by no means of uniform efficiency. Halkyn quarries, situated about three miles nd from the town of Flint, form at present principal industrial centre, and it appears there exist in the Halkyn mountain deposits ead and zinc unique in this country. In r to provide access to and from these rries and mines a Mid-Flintshire Railway roposed, possibly to connect Wrexham and d with the coast line near Holywell, and it ointed out that such a line would help to elop the uplands west of Connah's Quay, ch are at present isolated. In connection Holywell it is interesting to recall the essful fight that was waged some twenty s ago in Parliament, whereby the output St. Winifred's Well was preserved from erground tapping, which would have ruined industries that had established themselves g the resulting stream—industries that still t.

he only town of real importance embraced this scheme is Chester, and we note with faction that it is not regarded as desirable ttempt its conversion into a commercial re, not only because it is in the widest ests of the city that its amenities should preserved, but also because its situation is ited to its commercial development. Chester is, of course, one of England's Roman towns, and the old Roman cross road centre still enjoys its original importance; in fact, it has now to carry the traffic poured in by no less than ten radial roads. As a remedy for the resulting congestion, it is proposed to form a ring road almost entirely outside the city boundary to take the heavy traffic that has no reason to stop in Chester, and whose presence in the streets is not desired by the city authorities. Further relief to the town is recommended in the form of a new road connecting Ellesmere Port and Queensferry Road which would probably pass Ledsham Station.

In order to facilitate coastal traffic along the Dee, it is suggested that a by-pass road should be constructed to branch off below Saltney, near the Chester ring road, and connect direct with the coastal road beyond Connah's Quay, leaving the latter, Queensferry, and Sandycroft on the north, and Hawarden on the south.

An interesting account is given of the mediæval and static town of Flint, which was laid out on town-planning lines by Edward I; its peculiarity is that the streets all run in one direction, there being only one cross road—that is still used as the main road along the coast. The region is singularly rich in pre-historic remains, earthworks and castles, and this volume includes a map showing their situations.



It is suggested that housing areas should be limited to the land lying above the 50 ft. contour line, heavy trades being restricted to a strip along the River Dee, with the single exception of a small area running up from the coast towards Holywell.

No less than nine local authorities are concerned with this scheme, and although the region may not be one that lends itself to dramatic proposals, it should certainly be capable of enjoying increasing prosperity as it gets more fully organised and developed. The Report itself is attractively produced.

* The Deeside Regional Planning Scheme (Chester Flintshire)." The Report prepared for the Joint mittee of Local Authorities by Patrick Aber- ibie, Sydney Kelly, and Theodore Fyfe. don: Hodder & Stoughton, Ltd.)

A WAYSIDE SHRINE.

This shrine, which will commemorate the victims of an Irish ambush, is to be erected in Connacht on the roadside close to the spot of the ambush. The architect is Mr. Gabriel Porte, of Belfast. A local limestone will be used for the monument, the base and altar being Irish granite. The cross will also be in limestone with a lead inlay.

A Wayside Shrine, Connacht, Ireland. Mr. Gabriel Porte, Architect.

BOOK REVIEWS.

Canterbury Cathedral. By S. A. WARNER, M.A. (Oxon). (London: Society for Promoting Christian Knowledge.) Price 7s. 6d.

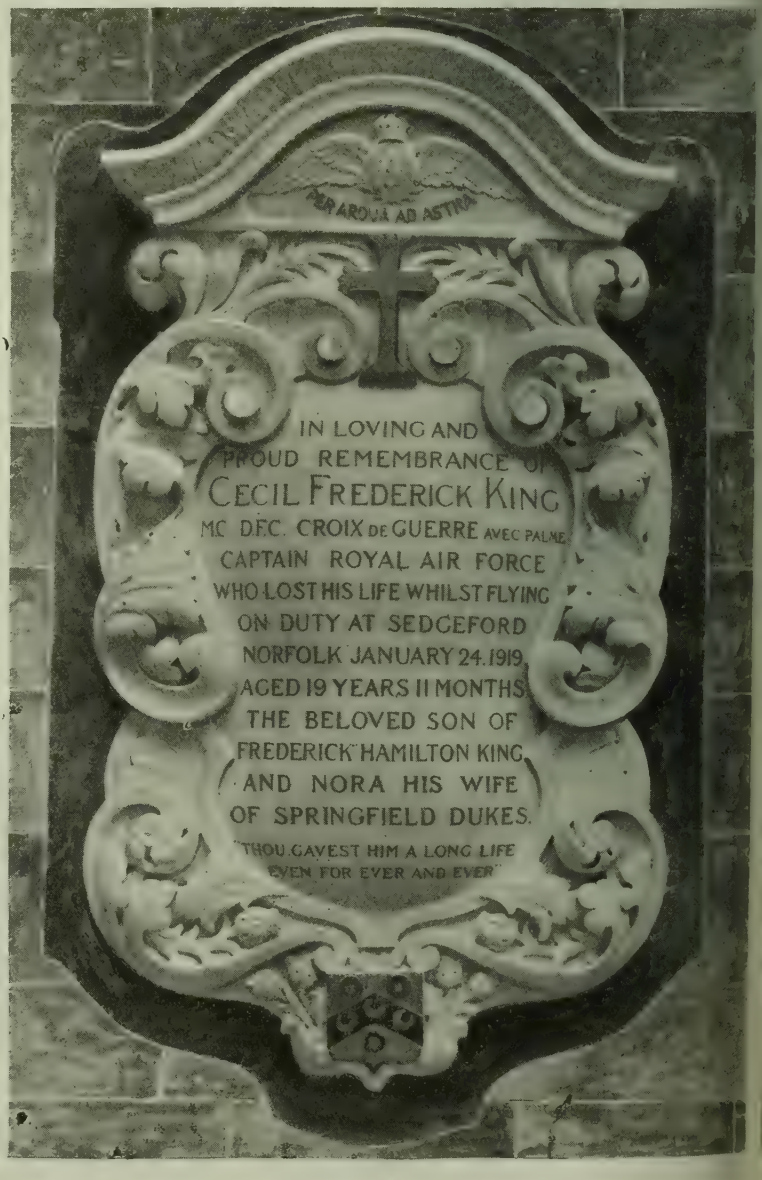
Mr. Warner's handbook on Canterbury Cathedral belongs to that class of works upon architecture in which the artistic and constructional value of the buildings under discussion are examined side by side with the purpose for which they were erected. Some notes on life within the monastery originally attached to the cathedral add very considerably to the interest of the building and give the reader an opportunity of realising the functions of a religious establishment as a centre of civilisation and culture in days when other fashions prevailed and education, as we understand it, was by no means general. A brief account of the more important among the long line of archbishops also helps to illuminate the political significance of the archbishopric both at home and abroad, since the history of Canterbury is concerned with the dealings of the English Church with that of Rome, a connection that passed through many stages wavering between complete subservience and open revolt and final separation. Independence was a leading characteristic, however, and the authority of the Pope was generally acknowledged most devoutly when the Archbishop for the time being felt the need of a powerful ally in some struggle against the king and the representatives of civil as opposed to ecclesiastical law. The character of Thomas à Becket—or, as Mr. Warner amends the name, "Thomas Becket"—and the nature of his conflict with King Henry II is recapitulated in a manner calculated to explain the hold upon popular imagination exercised by this loyal and high-spirited son of the Church.

In important particulars Canterbury Cathedral is Becket's Cathedral. The eastern termination of the building is a rounded structure generally known as Becket's Crown, and of the remaining fragments of ancient glass in the windows some of the best both in colour and in historic interest are those which illustrate the miracles performed near the shrine of the great English saint. Most eloquent of all, the worn kneeling places in the old paving stones before the miracle windows testify to the extraordinary charm exercised by a steadfast man in an age of anarchy, and the appeal of his tragic death.

Both the life of the community and the architecture of the buildings centre about the monastic waterworks introduced by Prior Wilbert in 1160, and Mr. Warner's account of the scheme serves to connect the two parts of his book. The author agrees with many other writers in attributing a lack of personal cleanliness to the people of England in Norman and mediæval times, and his remarks on the Canterbury water supply might be taken as pointing to an exceptionally favoured state of things at that monastery. The remains of extensive waterworks lately discovered in excavations at Rievaulx and Melrose Abbeys point to the fact that cleanliness and sanitation were probably in quite as forward a state as in Southern Europe to-day. The rule that now holds good also applied then, and people who happened to like to be clean generally found the means to be so.

The description of the architecture and fittings of the church is clear and is illustrated with plans and photographs and by reproductions of the author's sketches in line. Professor Willis's monumental work on the "Architectural History of Canterbury Cathedral" is freely referred to and several of Willis's illustrations are republished in the book.

The Hoarding. By JOHN OWEN. (London: Hodder & Stoughton.) Price 7s. 6d. net.



It is always entertaining to read a novel dealing with a commercial problem, and particularly so to those who feel that they have ideas on the subject. In this novel the author finds his setting in a world dedicated to commercial advertising, and his characters supply the arguments for and against the ethics of advertising. We have the whole case for advertising put forward by Boxrider, the publicity man, who knows what he wants and means to get it. The "Transatlantic argot" of the business man is subtly contrasted with the argot of the art world. Boxrider's creed was at least honest; nothing was too good for his work, and the picture on the hoarding must be a fair statement of the advertiser's claim. A picture might be good enough to hang in the Academy, but was it good enough to reproduce for the hoarding—the poor man's picture gallery?

The philosophy of advertising art, so far as we can gather it, seems to be that pictures of some sort are assumed to be necessary on the hoardings, and that being so it is better for the minds and morals of the public that it should have the best pictures. We can never make out in this theory whether the art is incidental to the pills or soap which it advertises, or *vice-versa*, but it is at least something in this imperfect world that a part of the advertiser's motive is that if pictures must be seen on the hoardings it is a method (though a strange one) of bringing great art into the lives of many people. "The Hoarding" is a competent piece of work, written with care and insight. It deals with a modern business problem in a clever manner, with the lightness and interest which a novel should have. It is not too much to say that a novel of this na often achieves a result which is denied to philosophical refinements of the essay.

The Petrology of the Sedimentary Rocks. F. H. HATCH and R. H. RASTALL. (Lon George Allen & Unwin, Ltd.) 2nd edi 1923.

Those of our readers who are intereste petrology will probably be conversant with Hatch's book, published a great many years dealing with igneous rocks. Petrologists apt to give too much attention to this br of the subject, and the temptation is ob because such rocks lend themselves much b to microscopic work and distinctive mi investigation. From a practical standp however—and this mostly concerns us—the no doubt whatever that the sedimentary r are of far greater importance. Though the under review does not deal with the subje these rocks from the utilitarian standpoi Mr. Howe's recently published work on Geology of Building Stones, it must be rem bered that every practical outcome of sc must be the result of initial researches in the lay reader would regard as pure science

The book, of over 350 pages, and conta more than 50 illustrations, is divided into parts, the first giving a petrological accou the sedimentary deposits—which, of co

and Geodetic Surveying. By DAVID
CLARK. (London: Constable & Co.)
Volume 1, 26s.; Volume 2, 25s. net.

rveying is a general term for a large subject;
are many branches. What may be termed
ary land surveying, to prepare plans of
erty, is a comparatively simple matter
ared with geographical surveying, to pro-
a good map of a country for general pur-
. In the former the surface of the earth is
ed as a horizontal plane; the latter treats
urface as of spheroid form and calls for
tional care and accuracy. The two
nes prepared by Mr. Clark deal respectively
plane and geodetic surveying. The first
ne, containing ten chapters, gives a clear
ment of the more common surveying
ments and surveying operations. The
cts of chain surveying, theodolite and
ass traversing, ordinary levelling, plane
surveying and contouring are described as
ed to cadastral and engineering surveys.
e rapid work is desired, the plane table can
sed to advantage to fill in survey details.
ffice work of computing areas and volumes
es attention. Earthwork tables are obtain-
and facilitate calculation.
e chapter on setting-out work is well worth
, covering as it does methods of setting out
us curves, including cases where point of
section of tangent is inaccessible. A very
enient set of tangential angles and of angle
pliers for setting out curves is published,
ed on cards 3 in. by 1½ in. for placing on
heodolite when in use. The values given
e from 5 to 200 units as a radius. The
ers dealing with the principles and practice
acheometry for obtaining distances by
uring angle subtended by a certain known
on a rod, hydrographical surveying, includ-
arine surveying and stream measurement,
the ground thoroughly.
e second volume, of seven chapters, is con-
d with branches of higher surveying. In
tic surveying the primary object is to fix
ute positions on the earth's surface and
lish a system of widely-separated points.
surveyor then has to deal with problems
ng to the determination of time, true
ian, latitude and longitude. For an inde-
nt survey recourse must be had to astro-
al determinations; but if one side of an
ate triangulation can be taken as a base,
sufficient data of one side, astronomical
vations are not necessary. The principal
ods of taking astronomical observations
escribed, based on particulars given in
Nautical Almanac," which supplies the
necessary for the solution of problems in
astronomy. The precise measurements
ed include corrections for: curvature,
tion, parallax, local attraction, tempera-
ariations and the like, hence considerable
is given to survey adjustment and data
al corrections. Suitable types of theodo-
nd levels are illustrated and adjustment
ned. The chapters dealing with topo-
ical reconnaissance, photographic survey-
he use of which is limited, and map con-
ion give a clear presentation of essential
. The author lays no claim to originality
s endeavoured—not without success—to
he subject in a concise manner.
h volume is provided with a copious index
ts of illustrative numerical examples and
rs are given. References are given to
only accessible text books and papers on

Memorial at Beaminster Grammar School. MR. C. W. PIKE, A.R.I.B.A., Architect.

[This memorial is in teak, with the lettering incised and the arms of the founder (Francis Tucker, *circa* 1550) carved in flat relief on a raised shield, and painted in heraldic colours. The joinery and the carving were executed by Messrs. Shapland & Petter, Barnstaple.]

subjects treated in the text which should prove useful to readers requiring further information. As text books the volumes are suitable for students preparing for examinations necessitating knowledge of surveying, supplemented by field work and instrument manipulation.

Warming Buildings by Hot Water. By F. W. DYE. (London: E. & F. N. Spon.) Price 12s. net. Third edition. 1923.

Those who are familiar with the earlier editions of Mr. Dye's book will find a good many changes in the present volume. As in former editions, the subject is treated in a very simple and readable manner, making the book suitable for those who do not aspire to any special engineering or mathematical knowledge. Introductory chapters are followed by a description of various low-pressure piping systems, concluding with a short but useful account of calculating pipe sizes (chapter 9). Only 17 pages are devoted to the discussion of accelerated systems which, in a volume of nearly 300 pages, seems little for such an important development in the use of hot-water heating, and only a page in this chapter is assigned to mechanical propulsion. Various difficulties and questions of heat emission then bring us to the middle of the volume A chapter follows on ascertaining the heating surface necessary under various conditions, followed by an account of the difficult subject of testing with the author's interesting series of temperature ranges. Some 40 pages are given to descriptions of boilers, pipes and fittings, and the book concludes with an account of high pressure system and air-heating plants, followed by appendices of tabular data. We think that this new edition should maintain the popularity of the author's work.

Industrial Organisation: Developments and Prospects. By JOHN LEE, M.A., M.Com.Sc. (London: Sir Isaac Pitman & Sons, Ltd.) Price 5s. net.

This book is based upon a series of lectures delivered at Cambridge University at the instance of the Board of Economics. It is practically a summary of various recent developments of industrial organisations throughout the world, and it may come as a surprise to many to realise the amount of attention which the problem has received, and how far we have progressed. The author states that it was not his object to build up any theory of industrial organisation; nevertheless, we like his conjectures, which appear to us to be reasonable and sound even if they are tentative. It would be a good thing for the country if everyone realised with the author that ". . . the one clear truth which was emphasised was that, just as political constitutions have evolved slowly and from simple to complex structures, so industrial constitutions must evolve."

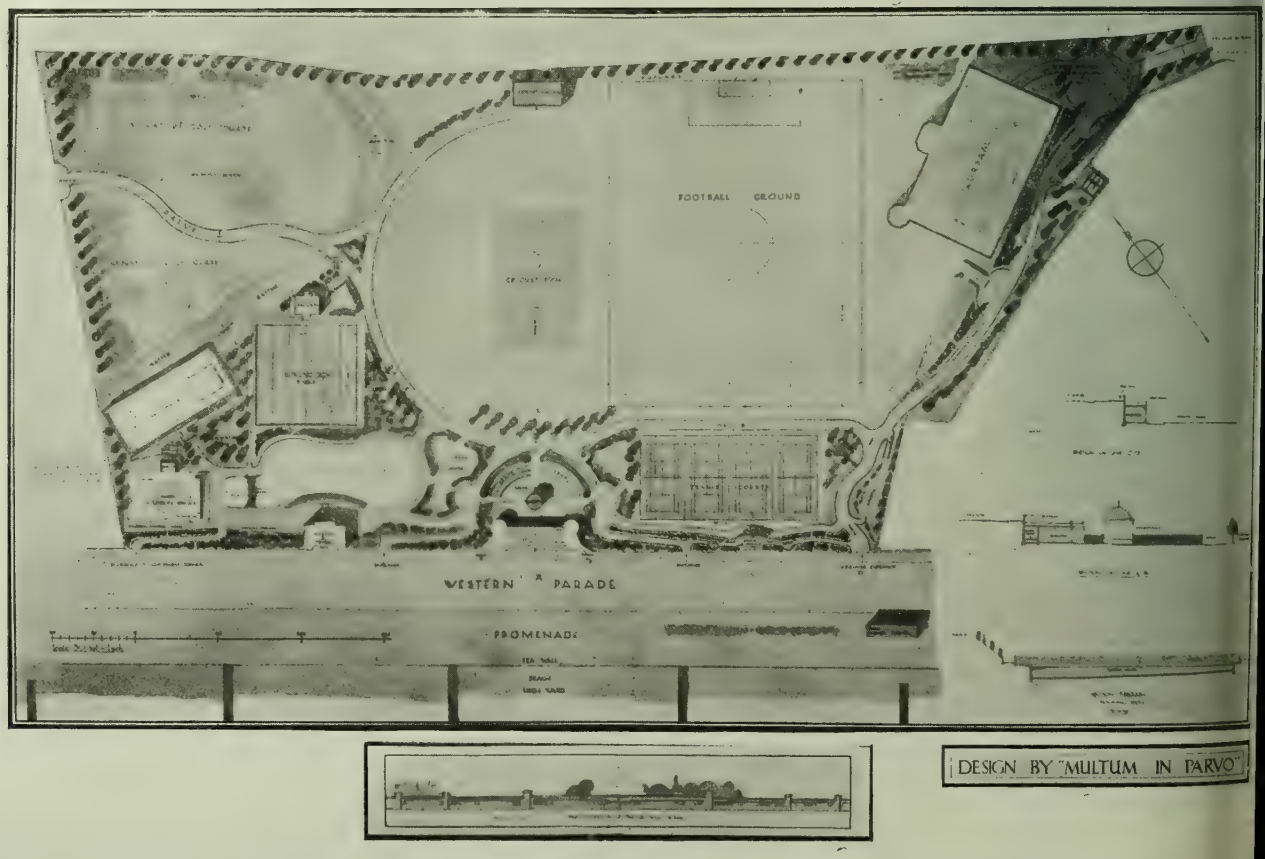
Altogether this is an excellent book for everyone engaged in industry, and for those who take an academic interest in industrial organisation.

THE ROAD PROBLEM.*

Of the many questions of national importance with which we are confronted, one of the most urgent is that of the use of our roads and their construction and upkeep. The attention which has been given to the subject in recent years, and especially since the war, is some indication that public authorities and their engineers and surveyors, recognising the needs of the time and the increasing use of our highways and byways by mechanically propelled vehicles, are fully aware of their obligations to the public. The extraordinary development in the use—the improper use sometimes—of our roads by motor traffic, not only of the main roads but of roads of lesser importance, must have struck anyone whose mind goes back only a few years before the war, when beyond the push bicycle there was very little but horse-drawn traffic, and when the pedestrian was able to use the roads with far more safety than he does to-day, though, perhaps, because of the surface condition of most roads, with no greater pleasure. The attention given by road engineers to the construction of roads has, in a large measure, solved the dust and mud problem, but the war arrested the progress being made, and it is only within the last few years that it has been resumed and that such an advance has been made in the provision of roads constructed to satisfy all reasonable needs. To what use and to what extent not only the main but the subsidiary roads of the country are now used is known to most people, and the time has surely arrived when legislation is necessary to deal with their misuse by the heavier forms of locomotion. It is obvious that many roads are not suitable for the traffic which passes over them, and if this use is to be continued roads must be greatly improved to meet modern requirements. Until the advent of mechanical transport the roads that were constructed gave a reasonable measure of satisfaction under ordinary circumstances, especially as they were all the time being slowly improved, but any extraordinary use of them gave rise to serious complaint and often led to litigation; the gradual improvement which was all the time taking place would no doubt have satisfied most people but for the enormous increase in motor traffic, which converted what was a local to a national problem and completely revolutionised the methods of construction. To what extent the problem has altered is shown in the preface to the useful and instructive book before us, the second edition of which has just appeared:—

"Our acquaintance with modern traffic conditions has been comparatively brief, but it has been sufficient to show that the solution of the road problem is not to be found in improving or reconstructing roads on the old lines, but in the construction of a type of road more suited to the weight and speed of the traffic, and in the endeavour to find the ideal road the attention of engineers is now centred on the all-concrete road. So far back as 1906 it was realised in the United States that the new conditions called for something entirely different from the roads which were adequate before the advent of motor traffic, and the fact that 30,000 miles of all-concrete roads have been laid in the United States since that date is sufficient evidence that this type of road is not now a subject of experiment, but is accepted as the best, if not the only, road which will stand up to the heavy and fast vehicles of the present day. . . . Previous to 1912 there were, in the United Kingdom, no concrete roads as we understand them to-day.

* "Concrete Roads and Their Construction." Second edition. (London: Concrete Publications, Ltd., 4, Catherine Street, Aldwych, W.C. 2. Price 5s. net.)



The number of roads laid year by ye summarised in the following table:—

Year.	No. of roads laid in each year.	Total up to end of ye
1912 ...	1 ...	1
1913 ...	0 ...	1
1914 ...	2 ...	3
1915 ...	3 ...	6
1916 ...	3 ...	9
1917 ...	3 ...	12
1918 ...	1 ...	13
1919 ...	12 ...	25
1920 ...	35 ...	60
1921 ...	48 ...	108
1922 ...	119 ...	227
June, 1923	54 ...	281

The book before us gives a descripti the concrete roads in the United Kingdo gether with a summary of the experien this form of construction gained in Aust Canada, New Zealand, and the United S of America. It is well arranged, and inc illustrations of many recently constructed crete roads, and a great deal of usefu formation with regard to their constru and the materials and mechanical device ployed. The work has been carefully e and compiled, and within its scope appea exhaust the subject.

Self-Supporting Houses at Northampto

The Northampton Housing Committee states *The Times*, succeeded in building h for workers since the Addison scheme discontinued which will cost the ratep nothing. There are three types of h costing from £309 to £415 each, and the h number 302. They are let at rents app mating to the pre-war rental of similar perty, and show an average direct loss per house per annum. But each pro £12 10s. in rates, so that the direct loss appears. Furthermore, the Government su of about £6 per annum will be received o of the houses.

Scheme for Lay-out of Recreation Ground, Western Parade, for Seaford Urban District Council. By MR. PHILIP SHUTER, Arch

[This design was awarded the first premium in a competition last year.]

SANITARY SURVEYS.

By ARTHUR H. DAVIS, F.S.I., F.I.San.E., M.R.San.I

FINITION.—By a sanitary survey is meant ie etymology of the words) an examination, ction, viewing, or "looking over," for the ses of health; or, to put it more tersely, amination of premises and their appur- ces for the purpose of ascertaining whether e so constructed and arranged that no ient to healthy and clean living is possible.

EDIMENTA.—Before starting on the survey ecessary to have the impedimenta, both al and technical, in order. In addition tebook, pencils, &c., a five-foot rule and e measure will be useful. As regards ical apparatus, if it is intended to test the (a very important part of a survey), gements must be made that the smoke- g machine, plugs, stopper-bags, rubber , &c., are on the spot.

THODS OF TESTING DRAINS.—There are l methods of testing drains, including the , olfactory, smoke, and compressed air but the writer is of opinion that for under- d drains the water test is the most efficient, hat the smoke test is best for vertical , the water test for the latter being quite essarily severe.*

THOD AND NOTE-TAKING.—In making a of this kind the surveyor should adopt nite method on which all similar surveys l be conducted so far as each case allows; er words, systemise the work and combine ıcy with speed. Further, if for any reason uld be necessary to produce the original in court or elsewhere a neat book shows l work. In addition, the drafting of the or preparation of any necessary specifi- s are vastly simplified.

N OF DRAINS.—An authentic plan of is an advantage, though not necessary. epare a rough plan on the spot is not, of , a difficult matter; the depths of inspec- nd disconnecting chambers to the invert annels should be measured.

E SURVEY.—It is usual to start from the e from roof downwards, and then to t the interior from top floor downwards.

SCRIPTION OF PREMISES.—First make a description of the premises, and state er detached, basement house, or otherwise, ss premises, &c., the materials used in the uction, and, if a house, the aspect.

TE OF REPAIR.—Next note state of repair, l, bad, or indifferent; and if there is any f settlement note if any and where.

FS (EAVES).—A roof with eaves gutters can pected from ground level. There should slipped or broken slates or tiles or ridge and the pointing and cement work to gy stacks and roof should be sound. It readily seen if the gutters and down- re faulty by the condition of the walls.

FS (PARAPET-GUTTERED).—With a para- ttered roof access is usually gained by ght or trap door. Walk all round roof. notes as to any defects to roof as in is paragraph. In addition, gutters should n and sound, and also the flats. Copper s should be placed at mouths of rain- downpipes and the soil vent pipe, and t walls should be in good repair. Make if any G.P.O. telegraph or telephone and wires. These are an unmitigated e in every way

IGHTS, &c.—The skylight or trap-door mework should next be inspected, as well ad, zinc, and glazed work and putties.

APPARENT DEFECTS TO ROOFS.—Any to roofs, &c., not apparent to the eye xternal inspection can at once be located the internal inspection of premises.

LS.—The walls should be next examined. ; to brickwork must be sound and joints note this particularly to reveals of doors dows. Should the surface of walls be rendered in cement this must be in order. If part of the walls is tiled or slated none of either must be broken, cracked, or missing. If walls are roughcast, carefully inspect. It more often than not hides inferior brickwork, and further it is no protection from the weather.

WOODWORK AND PAINTWORK.—Condition of all woodwork and paint should be noted, notice being taken if woodwork is defective through lack of it.

NON-BASEMENT HOUSES.—A non-basement house is all the better for a step up to enter; it is distinctly a disadvantage to be below the level of the road, especially on an incline.

PLINTHS, &c.—There should be a cement plinth about 9 in. up the wall from ground level, and also a concrete path floated in cement to falls to throw water away from the house. It is sometimes found that the cement at the junction of path and plinth is badly cracked, so that wet works its way in and defeats the object of their presence. There should be proper ventilation under floors, so look out for gratings or airbricks. It frequently is found that there is no through ventilation, owing to the fact that no air spaces have been left in the internal partition and sleeper walls. These air spaces are essential if a good through draught of fresh air is to be maintained.

FLOWER BEDS AGAINST WALLS.—A well-built house may be rendered damp in places by having flower beds right up against walls of house with no protection in the shape of cement work, tarring, or vertical slate courses. It is better still if the beds are not near walls.

BASEMENT HOUSES, DRY AREAS.—If there is a basement or semi-basement there should be a dry area all around the house; if there is one see that it is paved with impervious material, slopes away from the house, and is drained, and notice too if there is a cement plinth or three or four courses of damp-proof bricks. Should the area be narrow and closed in, note if properly ventilated by iron grating or perforated pavement light, with means of access to clean out. The earth on the far side must, of course, be supported by a retaining wall, which is best if faced with white glazed bricks. Weeps in these walls will usually be necessary.

SITE.—Do not omit, should the lowest floors be boarded ones, to have a board or two up in each room so as to ascertain whether the space thereunder is concreted, to prevent not only damp and air rising but also vermin breeding and getting into house.

MODEL AND LOCAL BY-LAWS.—Nowadays it is, of course, compulsory to concrete the whole site prior to the erection of a building under the local by-laws, but it must not be forgotten that there are an enormous number of buildings in existence which were erected before the Local Government Board (now the Ministry of Health) formulated in 1877 the "Model By-Laws," as they were empowered to do by the Public Health Act of 1875, and on which all the local councils' by-laws are based Previous to this, local authorities had certain lesser powers for making by-laws conferred on them by various Acts, but the Public Health Act, 1875, which applies to the country generally, was the sanitarians "Waterloo." London is, of course, governed by its own Acts, and the Metropolis Management Act of 1855 is the basis of its sanitary legislation. There are other subsequent Acts, the most important of which is the Public Health (London) Act, 1891. Local authorities are empowered under both Acts to make by-laws. It is interesting to note that under powers conferred by the Metropolis Management and Building Acts Amendment Act, 1878, a by-law was formulated which provides for the sites of all buildings being covered with 6 in. of concrete.

DRAIN TESTING.—During the time we have been inspecting the outside of the premises our assistants have been getting all ready for the testing of the drains. It is well to bear in mind that this testing is very important.

"INTERIOR VACUUM."—It may, however, not be out of place to remark that it is not advisable to set out on an expedition of this kind with (to put it nicely) a vacuum in one's interior, as to do so renders the surveyor far more susceptible to any ill effects likely to arise from smells.

UNDERGROUND DRAINS.—If the premises are occupied the occupants must be warned not to use apparatus until the test is completed. Then begin by testing the underground drains, the short lengths or branch drains to main drain first, and then all fittings, as the water from these will help to fill the main drain, which should be plugged at the outset and thus save time. If there are a large number of gullies and branches put a chalk mark against each as tested, so as to ensure none is missed.

AIR IN PIPES.—A piece of rubber piping must be inserted in each trap through the bend to the outlet side so that all air can escape, otherwise an air-lock will occur and the test will not be complete as the air remaining in the pipe will be under pressure, thus preventing the pipe becoming entirely filled. There are on the market specially-made patented traps (the "Ventest" yard gulley) having a removable screw vent hole at the top of the outlet side of the trap to prevent this air-lock when testing, but their use is not general.

F.A.I. AND FITTINGS.—Whilst the drains are being filled, carefully look round and see if F.A.I. is the same size as the drains, if the flap valve and grating are in order, and if all lavatory basins and sinks are disconnected from the drain and discharge into a gulley and have a puff pipe. The writer has found these discharging direct into manholes without puff pipes. By-laws under the Metropolis Management Act, 1855, say "Vent pipe not less than 4 in., but under By-law 6, under certain circumstances may be 3½ in. for a 4 in. drain; these are when soil pipes and waste pipes of slop sinks are used as outlet shafts.

GULLEYS.—Note carefully the position of down-pipes and gulleys. Especially look to see if any of the latter are in any cellar, larder, passage, or other floors. These can generally be sealed up as unnecessary, as their existence is usually forgotten, resulting in unsealing of trap and a danger and nuisance.

INSPECTING DRAINS WHEN FULL.—By this time the drains will be filled and ready for inspection. Note carefully the level of the water in each trap or manhole, and wait a few minutes to see if any subsidence and, if any, how much. If there is a subsidence make sure it is not because of a badly-fitting stopper or plug at outlet end.

HIDDEN I.C.'S.—Sometimes the I.C. at the inner end of the drains in a building cannot be found. It may be possible to locate this, if buried, by sounding with a stout stick the concrete floor near where it should be situated; it may obviate the necessity for digging. In old drainage systems I.C.'s are sometimes entirely absent.

TESTING SHORT LENGTHS.—When testing long lengths of drains, test only from manhole to manhole, and *not* in one length, also note construction of manhole, so as to allow for any absorption by bricks.

A "GOOD" DRAIN.—It may be well to note that because a drain stands the water test it is not necessarily a "good drain," because it may have too great or too little fall, or may be too large for its purpose.

VERTICAL DRAINS.—When all underground drains have been tested and the surveyor is satisfied with the results, take the smoke-testing machine and place it by the inspection chamber nearest the vertical pipes, and a ladder put up by the vent pipe, which must be blocked up, cotton waste being the usual material.

THE TEST.—A piece of cotton waste is put in the pump well of the machine and lighted; also, the short length of rubber tube from the pump is fastened to the nozzle of a drain plug and inserted in drain in I.C. The mouth of the V.P. must not, however, be blocked up until smoke issues therefrom, to ensure that the pipe is not blocked. The pump is then worked and the smoke forced into the pipe, but not so

* Public Health Acts Amendment Act, 1907 eals with the country at large), specially tor testing drains by smoke, and specifically testing by water.

vigorously as to force the trap seals by undue pressure, or the test will be useless. It will soon be seen by the action of the pump if the pipes are sound, but nevertheless an inspection of pipe joints and apparatus should be made. Make sure the jointing material of all iron pipes is lead.

One Building Originally Two.—It will sometimes be found that two premises originally quite separate have been altered so as to form one building. In this case it will be advisable to treat them as separate, and entirely finish one building before starting the other, or the notes may get muddled.

Completion of Tests.—On all tests being completed make sure that no plugs, stoppers, &c., have been left in the drains, and that all apparatus, &c., is at hand. Then seal down all I.C. covers, putty, white lead, and Russian tallow mixed being the best sealing material.

Inspection Chambers.—Notice the number of I.C.'s and their position, and if there is one at every end and at all changes of direction of drains, as this is an absolute necessity. The D.C. should be as near the sewer as reasonably possible.

Interior of I.C.—Whilst testing the drains, note construction of I.C.'s and D.C., and see that the sides above the channel pipes are well flaunched up in cement; these channel pipes must be semi-circular in section (white glazed are best) and laid on concrete.

Bends and Junctions.—See, too, that all bends (white glazed are best) come into the I.C. in the direction of flow, and that all changes of direction and junctions are made in an I.C.

Pipe Materials.—At the same time notice the drain pipes, as if not of iron they should be of glazed stoneware.

Intercepting Trap.—The I C. nearest the sewer or cesspool should have an intercepting trap. This "I.C." is always called a D.C. There are many kinds of intercepting traps; one kind has a patent back-pressure safety stopper, but the "Winsor" is usually considered the best. It may not be out of place to mention here the great discussions there have recently been on the usefulness or otherwise of this trap, and the Report of December 22, 1911, of the Departmental Committee to the Local Government Board on "Intercepting Traps in House Drains" is interesting. At all events the best-known experts have disagreed and taken entirely opposite views. Sufficient is it for us that nearly every local authority requires it. An intercepting trap was required originally by By-laws 5 and 6 formulated under the Metropolitan Management Act, 1855, but it was first used about 1876.

Combined Drains.—Another point before we leave drains is carefully to notice whether the drainage systems of any adjoining property or properties are connected with that under survey. Under such circumstances, whether it is or is not a sewer and repairable by the local authority is a question both of law and fact, each case being judged on its own merits. Of course, this is entirely apart from any question as to the advisability of having a sewer vested in a local authority on private property, to which the said authority would have access at all times for all purposes.

Definition of Drain under Public Health Act, 1875.—By Section 4, which repeals words of the earlier Act of 1848 (now repealed) "drain" is defined as meaning "any drain of, and used for the drainage of one building only or premises within the same curtilage, and made merely for the purpose of communicating therefrom with a cesspool or other like receptacle for drainage, or with a sewer into which the drainage of two or more buildings or premises occupied by different persons is conveyed. All other drains, except drains vested in, or under the control of a road authority, which is not also a local sanitary authority, are included in the term sewer."

Definition of Drain Under Section 250, Metropolis Management Act, 1855.—"The word drain shall mean and include any drain of and used for drainage of one building only, or premises within the same curtilage, and merely made for the purpose of communicating with a cesspool or other receptacle for drainage, or with a sewer into which the drainage of two or more buildings or premises occupied by different persons is conveyed, *and shall also include any drain for draining any group or block of houses by a combined operation under the order of any vestry or board.*"

The words in italics show the chief difference between the law in London and in the country.

An epitome of the above is as follows: When two or more premises drain into the same drain with the consent of the local authority it is a drain, but when without its knowledge and consent it is a sewer, and therefore repairable by the local authority. Also, even when a combined drain is joined into by any person and such connection is without the knowledge or consent of the local authority, it becomes a sewer from the point of junction.

Cause of Damage.—Finally, if the drains are found to be damaged, endeavour to ascertain the cause, so that the same error may not be made again. They may never have been properly laid at the outset, or may be damaged by the use of too new cement (burst sockets), faulty filling of trenches, or not properly bedding pipes on length (broken pipes) too near surface of road, or carried under a non-supported wall which has settled (crushed pipes), or other defects of workmanship.

Internal Inspection.—As regards the internal inspection of the premises, as before stated, it will at once be obvious on viewing the top floor rooms whether or not the roof is sound.

Trap-Door as Fire Escape.—If the roof has a trap-door note its utility for fire escape purposes, and the method of reaching it. There are several methods, the best being the trap-door which opens automatically by levers on the steps and lowered to floor level. Remember, too, that steps are better than ladders.

R.W. Troughs.—In some good-class parapet-guttered houses about fifty or sixty years old it will be found that rainwater from the front of the house is run right under the rafters in a box-like trough, zinc or lead-lined (usually zinc), which trough discharges into a rain-water down-pipe at the back of the house. Condemn this trough, as it is liable to blockage either at inlet or outlet, will overflow, and do considerable damage. Arrange that the rainwater from the front side of the roof is carried away down the front of house in 4 in. L.C.C. pattern cast-iron down-pipes with caulked lead joints and discharges over a gulley at foot.

Settlements.—Do not omit to look for any signs of settlement in going through a house. Notice particularly ceilings and junctions of walls, as well as window and door frames. Some of the defects are often very skilfully hidden to deceive a would-be purchaser.

Smoky Chimneys.—Notice if there are any smoky chimneys, as they probably can be remedied by one or other of the patent pots and cowls.

Cold-Water Storage Cistern.—Ascertain the position of the cold-water storage cistern, and note if it is readily accessible. Make sure the cover is airtight and that there is an overflow pipe carried to the outside wall and well clear of it. The expansion pipe of the hot-water system usually discharges over this cistern. Make sure, also, that there is a separate cistern for supplying sanitary fittings apart from the main domestic supply cistern.

Internal Repairs.—A note in general terms must, of course, be made as to the state of internal repair and decoration of the premises.

Attics.—The top rooms of large houses often have sloping ceilings, but do not describe them as a bedroom unless each has a proper window which opens; also if, as is very often the case, there is no chimney there should be other means of ventilation, such as a grating. In London, under the 1894 Building Act, a habitable room not in the roof must be 8 ft. 6 in. high. If the room is wholly or partially in the roof, the height must be 8 ft. throughout for not less than half the area of the room. There is no legislation as regards air space, but the minimum may be put as the minimum requirements per person for common lodging houses, viz., 400 cubic ft. per person. The Ministry of Health has now certain definite requirements which have to fulfilled if houses are being built in order obtain the subsidy.

Bedrooms.—All other bedrooms should ha fireplaces and good windows to ensure t proper amount of light and ventilation. Ta care that the vent pipe is nowhere near a windo but see that this is carried well up above the ro It is a growing fashion to have fitted lavato basins in bedrooms, but if properly trapped a ventilated and with an accessible overflow the should be no nuisance, although it would better if a bedroom were kept clear of su fittings, which in the writer's opinion are o of place there in a private house, althou perhaps permissible in an hotel.

Bathrooms.—In some houses the ba room adjoins and opens into the principal be room. If this be so, there should be also separate entrance from a landing. As regar the apartment itself, often a large sum is spe in tiling the floor and walls, or mosaic wo rubber tiling, &c., but all these, though ni tend to make the room cold in winter. The roo should be light and airy. In an ordinary ho it will suffice to advise for "Emdeca" rou walls, and, say, cork lino to floor, to preve stained walls and ceilings, and to see that t bath is unenclosed and stands in a lead trapp safe.

Baths.—As to the bath itself, condemn o which requires enamel painting, as it we away so quickly, especially as most people tu on the hot water first. An enamelled iron r edge bath on claw feet is quite sufficient for ordinary house.

Showers.—If there is a shower bath, have copper rose; also, if hot and cold, note if th is a mixing box, and also a waterproof sh to prevent splashing.

Lavatory Basins.—The lavatory bas which should be quite unenclosed, is best enamelled earthenware. Both this and bath should have removable combined stand waste and overflow (as these can be read removed, cleaned, and replaced) and scre down taps, and both lavatory basin and b should be trapped and ventilated even if o single fittings. Of course, if other fittings found which are good they cannot be condemn wholesale because they are not the most up- date, and to replace is more or less expens

W.C.—A w.c. is often fitted in a bathroo there is no objection to this if supplied wit riser, if the bathroom does not open into other room, and if there is at least one ot w.c. inside the house. No local authority allow any room fitted with w.c. to open i another room; it is strictly prohibited by by-laws.

H.-W. Tank.—In a great many houses hot-water tank is found in the bathroom, is often used as a linen-airing cupboard. is an old-fashioned method of heating wa and hot-water pipes can easily be taken thro a cupboard for the purpose of linen air This system will be referred to again later.

W.C.'s Situation.—The situation of w.c.'s is important, and it is extraordinar what insanitary places they are found, and what antiquated fittings. The writer has c across many in City and West End pren without any window or any means of ventila at all. One wall must be an outside wall a proper window, at least 2 ft. square (ha which opens), also an airbrick or ventil independent of window, as it is usually fo that the window is shut at the time it sh be open. If it is an outside w.c. and the is not of concrete, cement floated, condem The floor should have a slight fall to (the model by-laws lay down ½ in. to or 1 in 24), and in addition to any other ver tion the door should be cut short 3 in. and bottom.

Apparatus.—As regards apparatus, br condemn all short and long hoppers. "container," D trap, and pan are rarely with now, and are, of course, disallowed b model by-laws. Condemn also those kn as the "wash out" variety, *i.e.*, those in w the trap is in front of the pan. The appa should be of the wash-down type with pol

seat, and should stand in a lead safe floor is not tiled or otherwise impervious d. There should be a vent pipe on the side of the trap. A good w.c. pan should a water seal of about 2½ in. Of course, at the w.w.p. cistern is in order, and that ush pipe is not less than 1¼ in. in diameter . is better), and is properly connected to an. Valve closets are quite good, especially uses only used for part of the year, as is a double water seal to break before the atus becomes unsealed. A w.c. apparatus t un-enclosed—note this when inspecting. cularly note that the floor of a w.c. over der is impervious, also under the traps. riter knows of a case where a leaky trap, ected for some time, dripped down the of a larder below and a case of scarlet was attributed to this defect, it being ed that the milk became infected thereby.

USEMAID'S SINK.—Should there be a maid's sink it should be arranged as far as able on the same principles as a lavatory , and the outlet should discharge over a .

P SINK.—A slop sink, however, should ed as a w.c. and should discharge direct in. A w.w.p. cistern must be fitted over.

MP WALLS.—It may be found that the al walls are damp, particularly by win- If this be so, notice if the pointing to w reveals is sound, and that the stone ent sill is properly weathered and throated row off wet and prevent it running down It may be that repointing the whole of rickwork in cement may be all that is ed, but if the surveyor finds that the ness is caused by bad bricks or con- ion he should make a note, in case his decides to take the premises, of what is est remedy to get over defects; these f course depend on the class and locality se.

OORS.—Note if the floors are level and if unduly vibrate. The former can be cured firring up" the joists, the latter can be lessened by herring-bone strutting, stiffens and strengthens the floor.

OUND BASEMENT FLOORS.—The ground or basement (if there be one) of the ises should have careful attention. It lready been mentioned (under "Site") loors must be examined underneath to see perly concreted; a rotten floor at once ses absence of this, and of dampcourse. y work should be necessary under this t would be wise to advise a solid floor for ssages, cupboards, scullery, larder, pantry, its' w.c., etc., even if the kitchen floor ot so treated, as some persons object to a te floor there on account of coldness, gh a wood block floor would get over this.

CHEN.—If the kitchen is insufficiently l and ventilated, it will usually be possible to improve it. Carefully inspect all walls, rds and skirtings to see they are all and that there are no holes for vermin. e the range and the condition and make e. Next note the hot-water system.

-WATER SYSTEM.—If the H.-W.S. is not linder system, certainly advise that this talled if a practical test shows existing inadequate, as the cylinder system water quicker, and water is hotter than other method, there being so short a e from the boiler to cylinder to circulate. he capacity of the cylinder; it should too large, as the larger it is the longer takes to heat and the more fuel is used, a, of course, its capacity depends on mber of fittings in the premises. If y the system should be tested practi- nd the time the water takes to heat Coating the cylinder with asbestic helps to retain the heat.

ATE H.-W. HEATING.—In some houses be found that the hot-water system is separated from, or auxiliary to, the range; in fact, it is becoming quite n in good-class houses. In some cases, ted by gas, in some by a separate coal uch as the "O-Sho." The writer in- ne of these latter in a boys' club with great success. Frequently also water for baths is heated by a gas geyser, either solely or in conjunction with the kitchen range.

SAFETY VALVES.—Do not omit to notice the escape or steam pipe from the hot-water system, and at its highest point, which pipe is a safety valve, though sometimes in addition a weight safety valve is put over the kitchen mantel-shelf as an additional precaution, which is really quite a necessary one.

H. & C. WATER PIPES.—As regards H. & C. water pipes carried to upper floors, look round for the chase in the wall enclosed by a wood panel; this is really a necessity, otherwise if anything goes wrong a large amount of damage may be done to decorations in getting at the pipes.

SCULLERY.—The scullery is always near the kitchen. Condemn at once a stone sink as difficult to keep clean. Sinks may be, and often are, without a trap and screw eye, which is quite wrong. Both H. & C. supplies are necessary, and a draining board is useful. In a very large house a flush tank over the scullery sink is a great advantage to prevent blocking of the gulley by grease. One wall of the scullery must be an outside one on account of drainage and ventilation.

DRINKING WATER.—There should be at least one tap direct from the main for drinking and cooking purposes, and see that it is so labelled.

STOP-COCK.—Also see that the main stop-cock is labelled, so that it can easily be found in case of a burst pipe.

PANTRY.—The same remarks apply to the pantry as to the scullery, but the sink should be deeper.

LARDER.—The larder is often neglected. If the house is of any size, advise white tiled walls and slate slabs. See the ventilation is thorough, windows and door panels being covered with small-mesh stout metal screens, the door only being ventilated if the passage is airy.

SERVANTS' W.C.—The servants' W.C. should conform to the same principles as previously stated; they are, however, often found without windows and only a grating.

WALLS.—Walls of the basement should be noted as to repair and method of treatment, either tiled, painted, distempered, &c.

CELLARS.—Cellar doors should be short at the top or have holes bored in them so as to ventilate them and keep them dry.

COAL CELLARS.—Coal cellars behind kitchen ranges should be condemned, unless the walls are very thick. The writer knows of a case where lack of this precaution nearly caused a fire.

VENTILATION.—Carefully note ventilation, in basement houses especially. It is possible by enlarging existing windows or by judicious cutting into walls and making a new window or windows, &c., to make a vast improvement in ventilation and consequent dryness and freshness. In addition, the natural lighting will be improved, and this can be also assisted by glass panels in doors, &c.

DAMP AND DAMPCOURSE.—The lack of a dampcourse will at once be obvious on inspection of the ground or basement floor. The walls will be damp, the plaster broken away, the distemper blistered, or the paper bulgy and peeling

MATCH-LINED DADOES.—Be careful of a wall which has a match-lined dado, or is match-lined to ceiling. The match-lining is nailed to narrow battens, which, in turn, are fastened to wood plugs knocked into the wall. The object of this is to keep the wood away from dampness and thus to give an appearance of dryness to the room. If such a dado be found it is invariably a sign of dampness.

MATCH-LINED WALLS.—Be more careful still of a room wall which has been entirely match-boarded on the outside, and perhaps inside wall, too, and has then been papered. This is even more of a danger signal, and it is sometimes impossible to detect by the eye, especially when the skirting has been brought outside the boarding and there is a picture rail. A few sharp raps with the knuckles will, however, disclose the deception. A damp-proof course is an expensive item to put into an existing building, but that one is lacking must be reported on, both as to external and internal walls. The side of a wall which abuts directly to the earth should be carefully examined by digging away the earth to ascertain if there is a proper vertical dampcourse of, say, slates, or a 4½ in. wall with a cavity between it and main wall so that earth is kept away. See also that this hollow wall is taken above ground and the cavity properly protected by some impervious material.

DUSTBIN.—See that the dustbin is what is known as a "sanitary," circular in shape with tight-fitting lid, and that it stands in a shady position on a concrete base which slopes away from the house. Condemn a fixed dustbin, as it is impossible to empty properly, and part of the contents is dropped whilst it is being carried to the cart, whereas the circular bin can be carried intact to the cart. The model by-laws lay down that it must not exceed 2 cubic ft. in capacity. Where an ash-pit is used in common, not larger than one week's supply should be the limit of its capacity.

VENTILATION.—In an ordinary house no special provision for ventilation is necessary, except in exceptional cases, but if the surveyor sees in his tour of inspection that it can be improved anywhere he should note it in his report.

LIGHTING: NATURAL.—Natural light, *i.e.*, daylight, may be increased by additional windows, glass panels, or prism reflectors and pavement lights, especially the two last-mentioned in case of factory or business premises, and the surveyor should look out for this.

LIGHTING: ARTIFICIAL.—The artificial system of lighting in use should be noted, but beyond this it need not be considered here except to remark that from the sanitary point of view the incandescent system or electric light is the best as it does not in any way vitiate the air, which all other systems do to a more or less extent.

HEATING.—The heating arrangements should be commented on, whether coal stoves, gas, or radiators. Hot-water and steam pipes will not usually be found in ordinary houses, and need not be considered here, except to remark that under no circumstances must hot-water radiators be connected to ordinary domestic hot-water supply. Separate heating apparatus *must* be provided.

COAL.—In the writer's opinion, coal fires, in spite of the fact that they are somewhat wasteful of heat and create dust, are for ordinary houses the best, as they aid natural ventilation.

HEATING: GAS.—As regards gas, unless it is laid on the same principle as the coal fire it has the effect of drying up the moisture of the air and gives a stuffy heat which often creates drowsiness.

SMALL-CLASS PROPERTIES.

Small-class properties may perhaps be briefly dealt with. The general principles are the same as for large properties.

LIST OF DEFECTS.—In making an inspection it becomes necessary to make a list of defects, such as filthy ceilings, dirty and damaged walls, &c., and it will generally be found that the backs of the houses are in a far worse condition than the fronts.

LIST OF SANITARY DEFECTS AND SCHEDULE OF DILAPIDATIONS.—In any list of sanitary defects often a small portion only concerns the sanitary apparatus, therefore the list or schedule may become in fact an abbreviated schedule of dilapidations, so that a list of sanitary defects is a near relation to a schedule of dilapidations, only in a very much more general and abbreviated form.

HOUSING AND TOWN-PLANNING ACTS, 1909-1919.—It is perhaps proper just to mention that fine piece of legislature, the Housing and Town-Planning Act, 1909, as this has given local authorities amongst other things very greatly increased powers to inspect the artisan class of property, and to order a large amount of sanitary work to be done under penalty of a closing order if not complied with. The point that it is desired to emphasise is that these duties sometimes fall largely on the Medical Officer of Health, whose demands are often unreasonable,

as the writer can testify. There is also the later 1919 Act, which gives still greater powers to local authorities, some of whom, it is feared, are apt to abuse them by being one-sided in their attitude and in the application of the same.

SHOPS, &c.

It is surprising how badly some shops are ventilated and how inadequate is the w.c. accommodation.

W.C. ACCOMMODATION.—One example as to these will suffice. In a large shop and premises with three upper floors and ground floor shop with large workroom at rear there was only one w.c., and that in the shop and entirely closed in and unventilated.

IMPROVEMENT.—The writer, however, got over the difficulty by building two w.c.'s, both entered from the half-landings and carried on stanchions and girders. In this case, too, the skylight over the workshop was made to open in a suitable manner, and the fixed fanlights over the shop doors altered so as to drop inwards on to iron quadrant stays.

INSPECTING PRIOR TO TENANCY.—It is just as important to test drains of shops as it is of all other kinds of premises, otherwise the surveyor may be letting his clients in for trouble.

FACTORIES AND WORKSHOPS.—A building which is to be used as either a factory or workshop should be inspected on the principles as for other premises. It is not possible to say what the Factory Inspector's requirements are likely to be, each building having to be judged on its own merits, and the class of business to be carried on will, of course, affect this. The air space under the Factory Act, 1901, is: Ordinary working hours, per person 250 cu. ft.; Overtime, per person 400 cu. ft. It would be wise for the surveyor to approach the authorities with the information as to nature of the business proposed to be carried on, and the probable number and sex of employees, so that he may ascertain what their requirements are likely to be in the event of the premises being used by his client, if the building is, under the Factory and Workshops Act of 1907, what is termed an "old building," which in the case of a factory is one built before January 1, 1892, and in case of a workshop one built before January 1, 1896. Section 38 of the Public Health Act, 1891, deals with proper sanitary accommodation—nothing is stated in the Act as to the extent of the accommodation—apparently it is left to the sanitary authority to decide. Often the requirements of the "Sanitary Accommodation Order" of February 4, 1903 (of the Home Office), are taken as a basis. These are:—One sanitary convenience to every 25 females in all cases; one ditto for every 25 males of first 100 employed. For all above first 100 males, one w.c. for each 40. Where over 500 males, one w.c. for each 60. In the last two cases provided proper urinal accommodation is provided. It may be mentioned, however, that in this class of building the w.c. accommodation is often inadequate, and the bulk of what there is, is underground, and badly or entirely unventilated.

Also, there is frequently no proper provision for escape in case of fire, to roof or otherwise, and frequently there is no internal fireproof staircase or enclosure, with proper ingress and egress thereto as required by the Act. Briefly, then, the man who advises his client to take this class of premises without first conferring with the authorities as to their probable requirements, is possibly letting his client in for a great deal of trouble and expense.

POWERS OF LOCAL AUTHORITY TO ORDER WORK.—The local authority seem to be the sole judge as to what works are necessary in all cases of all kinds where they are called in. Of course, if the surveyor feels that their requirements are arbitrary he can always challenge them, and Court decisions show that the local authority is sometimes too overbearing.

COUNTRY PROPERTIES.

In surveying country properties certain points arise which do not usually occur in urban premises. These points are aspect, water supply, drainage of subsoil, sewage and refuse disposal, and lighting.

ASPECT.—The outlook of the principal living rooms should be noted.

WATER SUPPLY.—Note source of supply, whether from mains, well, or perhaps raised from a lower source by hydraulic ram. Observe the protection to source of supply, and it may in cases be necessary to have a sample of the supply analysed. The method of storage should be examined, also a provision made for storage in case of fire. This may be necessary even if the water is supplied by main, as there may not be sufficient pressure for the water to be sprayed from the fire hose to the top of the building.

SEWAGE DISPOSAL.—If there is no local sewerage system, sewage must, if the house be anything more than a cottage, be run into a cesspool or treated bacterially, and the latter system is undoubtedly preferable

CESSPOOL.—If a cesspool is used, carefully note its construction, as it must be sound. Briefly, the cesspool should conform to the following requirements: at least, 50 ft. from house; 60 ft. from well; constructed in 9 in. brickwork; cement rendered on inside and puddled with clay 9 ins. thick at back. It must be roofed over and have an F.A.I. and a manhole cover for inspection, and the cesspool must be in such a position that its contents may be removed without passing through any building. Condemn an overflow as an unmitigated nuisance. In London: 100 ft. from any well, domestic building or public building, or any building in which a person is employed in manufacture, trade or business.—(By-laws under P.H.A., 1891.)

RAINWATER.—Note how rainwater from the roof and paved surfaces is dealt with. In the case of a cesspool, drainage could be either run into a soakaway or into tanks. If the latter, it could be utilised for domestic purposes, such as laundry work, carriage or motor cleaning, &c., an important factor if water is obtained by other sources than a company's main, and even then it would make a large difference in cost.

BACTERIA BEDS.—The best thing to do here is to take samples of the effluent and send them to be analysed. If not satisfactory, the bacterial filter beds will probably be at fault, but the system should be examined by an expert on the bacterial treatment of sewage, who will be better able to advise how to remedy any defects. *Note.*—The usual custom is only to run over land, and therefore there is no need to analyse the effluent if discharged into a running stream.

DISPOSAL OF HOUSE REFUSE.—If the premises are large, advise for a small refuse destructor. This is the best, quickest and cleanest way of getting rid of rubbish. Residuary clinker could be used for gardens as foundation for paths, as could be unburnable materials like tins and broken bottles, or they could be buried.

DRAINAGE OF SUBSOIL.—The position of the house and its general dryness and nature of subsoil will determine whether the drainage of the subsoil will be necessary. Ascertain if clay subsoil, as this, if not drained, may cause settlements owing to the clay sliding. This is specially liable to happen on the side of a hill. A system of agricultural drains would have to be arranged for, so as to throw the water away from the house. If the house should be on the slope of a of clay subsoil, a more than ordinarily wid area must be arranged for.

EARTH CLOSETS.—The writer has not ha good fortune to make a report on a bui where earth closets are in vogue. They mus be passed, however, without a word. The struction of the closet should be as for a closet. There are several kinds of earth cl in use, but Moule's earth closet is considere best.

REPORT.—A word as to the report. surveyor has probably his own pet meth compiling a report, but whatever this ma it should be concise and uninvolved, and a jumble of words and sentences unspaced unparagraphed. A properly drawn up r will greatly help in the preparation of necessary specifications of alterations, re and decoration, and makes very much pleasant and easy reading.

Repairing Drains from Inside.

The following is a method of repairing u ground drains which obviates the necessit digging down, removing, and entirely rel existing drains, with the consequent lo time and inconvenience and expense. It is, of course, not applicable to every ca

Any pipe drain of whatever size can be watertight with a machine without takin ground flooring, tiling or mosaic paving. machine consists of two rubber rings on or metal discs working on a rod, which is solid or flexible, the latter to allow the ma to be used where there are bends in the From the inspection and/or disconnecting c bers at either end of drain a cord is p through the drain to which the machi attached, and it is worked backwards forwards until all interstices are filled up cement and the pipes are made sound. internal surface of the pipes is after cleaned with the machine, so that a sm surface is left inside, no cement protrudi cause stoppage, which stoppage may occ bad workmanship when drains are relaid i usual manner. If a looking glass were p at one end of the drain when finished a joints could be seen perfectly smooth as t they had been trowelled.

Should a branch drain be connected t main it is necessary to open at that poi the machine when passing the opening entirely seal it up. To avoid this a plun forced into the main every time the ma passes.

The *modus operandi* is as follows: The in surface of the drain is thoroughly cleanse disinfected with acid, and the machine ins semi-solid cement is then placed betwee discs, and the pressure exerted by the pulling it through the drain is sufficie force the cement into interstices as stated and make it watertight. The process of p the disc and cement through the drain is c out from both ends, and is continued unt obvious by the amount of cement left a certain number of operations, that all inte and spaces have been entirely filled.

THE BUILDING TRADE.

HE RENT ACTS: REASE OF RENT.

tried in the County Court at Folke- briefly reported in *The Times* for r 11; we could wish that the report extended as the case was stated to be ture of a test case on which other cases , and costs were awarded on the higher he defendant on the ground that diffi- novel points of law were involved.

ouse in question was one of several the Strood Rural Council in 1916, when een let to the defendant on a weekly at a rent of 6s. 9d., the Council paying . On December 10, 1920, the Council n a notice to increase the rent, and June, 1921, a similar notice had been t no notice to quit had been given in n with either of these notices to increase On January 31, 1923, the Council had e defendant notice to quit expiring on 12, and apparently subsequently a ice to increase the rent had been given 20.

port does not state how the notices of were made up or how far they had ever ed upon, but from the report of the t it appears some question as to rates ve been raised, as this passage occurs: lmitted transfer of the burden of the the tenant not being accompanied by ion in rent was therefore invalid, and e to increase was, in the judge's opinion,

laintiffs appear to have been claiming re were 29 weeks' rent due at 7s. 5d. The defendants counterclaimed for 10½d. rent paid in excess. The Court to have held that the first two notices sleading and inaccurate, and refused d them; that all three notices to the rent were invalid; and to have gment for the defendants for £9 7s. 10d. counterclaim, the deduction from the laim being made up of the standard s. 9d. a week in arrear from December 11. ase is difficult to follow on this brief The first two notices to increase the ld, of course, be bad in the absence of o quit, as at that time this was essential e decision Kerr *v.* Bryde. (See *The* November 17, 1922, and January 26, The notice to quit given on January 31, uld not operate to make these former f increase regular (see Peizer *v.* Feder- *Builder*, December 16, 1921), for the f increase would bear a wrong date. l notice of increase given five months date of the notice to quit might in ircumstances be good; the report is fic enough to enable us to say what efect in it, but the figures indicate that all period, if any, could be in question notice became operative.

be useful in the abstract, and quite n this case, to consider how the Notices e Act, which came into force on June 7, ar on such points in future. Section 1 n (1) provides: "Where notice of o increase rent has, whether before or passing of this Act, been served on a onformity with section 3 subsection (2) ncipal Act, and a notice to terminate cy was necessary in order to make ase effective, the notice of intention to he rent shall have effect, and shall be ways to have had effect, as if it were or also a notice to terminate the existing n the day immediately preceding the m which the increase is or was first to or on the earliest day thereafter on had been a notice to terminate the would have been effective for that nd in the latter case a notice of erved before the passing of this Act eemed to have had effect as if such earliest date had been specified in the notice as the date from which the increase was to take effect."

This subsection at first sight seems unlimited in its retrospective effect, but that is not the case, for by proviso (*a*) it is provided that "nothing in this Act shall entitle a landlord after the passing of this Act to recover from a tenant in respect of any period before December 1, 1922, the increase of rent made valid by this Act, or any sums which have been recovered from the landlord before that date by means of deductions from rent or otherwise, or any rent due before that date which has not been paid by reason of such deductions having been made therefrom, but section 14 subsection (1) of the principal Act shall not apply to an increase of rent made valid by this Act which was paid by or recovered from a tenant prior to December 1, 1922." This subsection made any sum paid on account of rent which was in law irrecoverable by the landlord recoverable by the tenant by deduction from rent or otherwise.

It will be seen, therefore, that under the above subsection, a notice to increase rent now operates as a notice to determine the tenancy as from the earliest legal date, but that where this procedure is adopted in place of a regular notice to quit December 1, 1922, is made the date from which all adjustments between the parties as to rent must be made, and validated increases under this Act are also subject to all the other provisions of the Act, such as payments by instalments and questions as to the condition of the premises, &c.

BOOK-KEEPING AND ACCOUNTS.*

THIS book appears to deal with the subject of book-keeping and accounts, as set forth in its "Contents," in a very thorough and concise style, not over-elaborate, but condensed in a clear and lucid manner. Its illustrations of different types of accounts are clearly set out and one can quite understand it would be found most useful to the student about to take up studies for secretarial or auditorial professional work.

Its various chapters on Income Tax, Company Accounts, &c., should also prove of assistance to the company director for reference on doubtful points which constantly arise in the course of business, but possibly more especially to the company secretary, who is often called upon at a moment's notice for advice on some technical point regarding company accounts, although if he be a wise man he usually refers it to his accountants to deal with. One notices a special chapter given to builders' and contractors' accounts on page 172, presumably because these are traders whose accounts are more complicated than other merchants, and more often worse kept. In a book of this kind the writer can, of course, only deal in a summarised manner from a purely book-keeping point of view with such a highly technical business, in which costing accounts are so important and must be worked in conjunction with the financial books, and the criticisms of this chapter must be read bearing in mind this preliminary note.

In passing one cannot help noticing the happy state of affairs of one "John Brown," as illustrated, a builder, at 31st December, 1901, with work in progress value £1,000, £3,500 bank balance and no liabilities. And pre-war, too! With regard to time sheet, a different form is as below, and is found more useful, as it obviates the necessity of repeating the name of contract each day:—

Contract.	Nature of work	Materials used.	S	M	T	W	T	F	Hours Total.
Jones ..	Daywork	—	5		4		3		12
Bell ..	—	—		2	5		6		13

The wages book should show a column for transfers, *i.e.*, time worked on other or outside contracts, also for expenses or extras, as well as deductions, also columns for State Insurance, Employers' and Employees' Contributions for Health and Unemployment. The Prime Cost ledger rulings as shown would possibly give the contractor a total P.C. of his contract; it all depends upon the inclusive nature of the "Sundries" item, but such headings as "Sundries" for a complete P.C. would have to be eliminated, and each contract would have to take its share in detail of "on cost" charges, such as machinery, garage or transport charges, plant hire, and percentage for trade expenses, and so forth.

The Purchase Analysis book, worked in conjunction with the Stock Book, Contract P.C., and Day Book is a necessary book, but in a large firm it would be impossible to classify every invoice in the manner shown and the amounts of accounts only would answer the same purpose, but amplified to include purchases for plant, machinery, garage, trade expenses, &c.

* *Johnson's Book-keeping and Accounts, with Notes on Auditing, &c.* By George Johnson, F.L.A.A., F.C.I.S. (London: Effingham Wilson, 16, Copthall-avenue. E.C.2.) Price 10s. 6d. net.

THRIFT SCHEMES IN INDUSTRY.

SIR WILLIAM SCHOOLING, vice-chairman of the National Savings Committee, speaking on "Thrift Schemes in Industry," at the Industrial Welfare Conference at Oxford on Monday, said that if industry would co-operate to the fullest possible extent in encouraging thrift it would do much more for the welfare of the community and the well-being of the individual than legislation. The best opinion on the whole was that there was no moral obligation on the employer to provide for the old age of his workers, but there was some moral obligation to pay employees at such a rate as would enable them to make provision for themselves and to facilitate the making of that provision by encouraging concerted action among the employees. Superannuation funds should not be started without the best actuarial advice. Endowment schemes under which a year's salary was paid on the death of the employee had "caught on" to a surprising extent in America. A disadvantage of such schemes was that they made no provision for superannuation.

New School at Durham.

The Durham County Council Education Department are inviting tenders for the erection of a new school to accommodate 242 scholars at Kirk Merrington.

Staff Convention.

In the course of his address of welcome to the recent Convention of Messrs. Robt. Ingham Clark & Co., Ltd., varnish and enamel manufacturers, of West Ham Abbey, E.15, Mr. R. F. Clark referred to the "Paint more, save more" campaign in the newspapers early this year, and appealed for further co-operation in this movement.

During the Convention papers were read by Mr. F. S. Evans on "Comparison of Selling at Home and Abroad"; by Mr. E. P. Frake Walters on "The Merchant: the Medium between Manufacturer and Consumer"; by Mr. F. W. Jefferson on "Architects in Relation to the Consumer"; and Mr. F. M. Jordan on "The Effect of Advertising on the Merchants' Sales."

DESIGN AND LAY-OUT OF MOTOR GARAGES.

In dealing with the design and lay-out of garages, the writer has endeavoured to present the subject in such a manner as to interest architectural and constructional experts, who, in the drawing up of plans for this particular class of building, are unable to discover any specialised information on the subject in current technical literature.

Garages, both for private and public use, must possess special features which, unless incorporated in the design and construction, will limit the efficiency and convenience of the finished buildings. Therefore, the main object of this article will be to consider the design and lay-out of several classes of garage from the view-point of their prospective users, and to offer such suggestions as may prove of value to architects and builders who are called upon to undertake the actual design and construction.

Notwithstanding the ever-increasing use of motor vehicles and the consequent development of the public garaging and repairing industry, those most closely associated with the trade appear to have devoted but little attention to the design of the buildings in which their activities are carried out. Many promising undertakings in the motor business have produced disappointing results, not because the patronage of clients was withheld, or by reasons of inefficient technical staffs, but simply on account of endeavouring to conduct the business in inadequate or unsuitable premises. The latter fact is so well-known that persons accustomed to efficiency organisation in various forms have often commented upon the ability of some motor garage firms to keep their heads above water at all.

One of the principal difficulties in preparing garage designs is found in the fact that the individuals in need of the buildings are not fully conversant with their requirements; and, as a garage suitable for one client may be altogether useless for another, it becomes desirable for the architect to be in the position of acting as a consultant in this particular direction.

With this guiding principle in view, let us proceed to consider the special requirements of various classes of garage users and evolve plans whereby such requirements can be met.

Owners of private houses to which stabling is attached usually make use of the outbuildings as garages, until such times as they are unable to endure the inconvenience any longer, and the old building is demolished for the purpose of erecting one of a more suitable description. Coach-houses which were quite satisfactory for their intended purposes when they came under the control of a paid servant, fail in many respects when used by modern motorists, of whom the larger proportion consists of owner-drivers. Not only does this class of motor owner drive his own car, but, in the interests of economy, attends to its upkeep and maintenance in addition, the latter factor having a very important influence upon the design of the building, as we shall proceed to demonstrate.

Whilst some motorists are content to look upon the private garage as a kind of glorified bicycle shed, of sufficient dimensions to house their cars, others insist that the building shall conform with the architectural features of the residence to which it is attached, which immediately raises the matter of garage construction from mediocrity to a subject of artistic interest. The architect's skill will enable him to produce designs calculated to dignify a class of structure which too often consists of three bare and window-less walls, an uglier roof, and an ungainly entrance.

The site selected for the garage is of greater importance than is often realised, especially where owner-drivers are concerned. Its relation to the front door of the residence, its accessibility from the road without involving alterations to the front garden, the convenience of its connection with supplies of water, gas and electric light from the house, and ease of access for the owner for the purpose of effecting car adjustments, are all matters which have to be considered in determining the position selected for the site, and bear a close connection with the cost of preparing the building for service.

For example, to the cost of erecting the garage, that of making up a roadway from the street to its entrance has to be considered, for, even in cases where a carriage drive already exists, the surface of the latter almost invariably fails to withstand the continual starting and stopping of a motor car, the studded tyres of which are inclined to tear up any but the most closely consolidated of road surfaces.

As a general rule private garages are far too small to be utilised to the greatest advantage, especially when required for the use of owner-drivers. The idea of limiting the first cost of the building is usually responsible for this kind of mistake on the part of the owner, for whilst the proposed structure need not possess the characteristics of a miniature repair establishment, it is certainly a mistaken policy to limit the dimensions so that the acquisition of a more powerful car at a later date will necessitate radical structural alterations to the building. The man who commences motoring with a small two-seater car may never aspire to the possession of a six-cylinder limousine and, in consequence, will never build a very pretentious garage; but in the course of a couple of seasons he will probably acquire a medium powered four-seater, and as the difference in the overall dimensions of the latter do not differ very greatly from those of the two-seater, he will be well advised to allow for the possible expansion of his ideas on motoring in determining the area to be occupied by the garage.

Taking the average wheel base of a typical car of medium power at 9 ft., and allowing an additional length of 3 ft. 6 in. to clear the wheels and wings, with an overall width of 5 ft. 6 in., we arrive at the floor space actually covered by the car. A space of at least 3 ft. should be allowed at either side of the car, whilst the length of the garage should exceed that of the car by 5 ft. Between the garage door and the rear of the car there should be a space of 12 in., leaving sufficient room for a work bench at the opposite end. In passing, it may be mentioned that the full specifications for the proposed building should include all internal fittings, such as benches, cupboards, tool racks, and other objects required by the motorists.

Whether the owner-driver intends to perform the operation of washing the car himself or to employ someone else for the purpose, adequate provision for the process must be made when designing the garage. Cars cannot be washed properly in the private garage, whilst the inconvenience of having this work done regularly at the local garage justifies the allocation of a space for a car wash. The area required will be approximately the same as covered by the garage and may occupy a convenient space in front of the building. A glazed roof the wash adds to its usefulness, for b serving as a shelter from inclement w during washing operations, it will act convenient place for standing the car for periods without making use of the garag

The surface of the washing area should slight fall from each direction with su gulleys communicating with a central drai provisions for a mud and grease trap concrete base covered with cement and g chips forms a very good flooring for the and surface for the wash. Most for surface with an asphalte base shoul avoided owing to their susceptibility t action of grease.

A water supply should be led to the was a convenient stand pipe arranged for a connection.

As it is impossible to give the nec attention to a car when housed in a dark g particular care should be paid to pro plenty of natural light when designin building. Roof lights undoubtedly for best means of attaining this end, but i case the lightest side of the garage shoul sist largely of windows, especially when intended to build an inspection pit, for obv the car standing over the pit shuts out m the light from beneath.

The interior should also be wired for e light, where a supply of electricity is ava and in addition to arranging the points i venient positions to shed light on the benc over the car, one should be provided i inspection pit, so that straggling leads portable hand-lamps may be avoided. power circuit is available the current m used for electric radiators for heatin interior of the garage, but otherwise th form of heating consists of employing hot radiators, which are supplied from a sma boiler situated just outside the garage.

Although an inspection pit is not an al necessity in the private motorist's garag convenience it provides is well wort expense entailed by its construction. lubrication of cars, even of modern design, always too easily done from above, whils motorists who take a keen interest mechanism of their cars like to make per inspections and effect small adjustment the object of ensuring safety and keeping repair bills.

The inspection pit should be excavated depth of 4 ft., and have a width of 3 ft. both sides and bottom being finished concrete with a smooth surface of cemen finishing off the corners with a radiu possible to keep the pit clean, a drain and trap being required for the same purpos

A ledge formed all round the top of t will be required to support flush fitting used as a covering when it is not in use, further convenience consists of a shelf ext from one end to the other and about inches wide, which serves to carry too cleaning material whilst work is in p beneath the chassis. Access to the pit gained by means of concrete steps for

Sketch Showing Main Features of a Private Garage.

e end farthest from the garage door, which is eferable to the use of a removable wooden lder.

As a rule the private motorist does not require stock large quantities of petrol and oil, but. en though the supply consist of but a few llons, the inflammable materials must be ored with due regard to regulations and fire ks. The best plan for such storage is to nstruct a small pit occupying a corner of the vered wash, in which from ten to twenty two-llon tins of petrol, together with a small erve of lubricating oil, can be kept.

This pit should have a watertight covering ted over a ledge rising about six inches above e surface of the wash, so that there is no risk water dripping into the petrol store. The ggested method of petrol storage is absolutely fe and its position is very convenient for ing the tank of the car preparatory to a rney.

Owing to the restricted space usually available private garage buildings, the advantages of e rolling shutter type of door above those of e hinged variety become very obvious, and, erefore, this feature is one that should be corporated in the design wherever possible, pecially as very little extra expense is entailed.

Proposed New Severn Railway Bridge.

At a conference of public authorities of South ales at Chepstow to consider improved means transport between South Wales and London, e Midlands and West of England, it was ted that the Great Western Railway Co. ended to erect a bridge across the River ern at Beachley in order to relieve congestion the Severn Tunnel. It was suggested that oad bridge should be constructed near the ne points simultaneously and that an effort uld be made to get Government assistance. e bridge would shorten the distance between points mentioned by 70 miles, as all road ffic from South Wales has to proceed via ucester to London.

Building Trades' Courses.

The courses in building trades' subjects at e Acton and Chiswick Polytechnic, Bath-road, iswick, commence on September 24. A full gramme will be forwarded on application to principal, Mr. V. C. Egerton.

Assessment of Flats.

Mr. E. C. Christmas, builder, of Forest Hill, .. writing in *The Times* last week, says :— bought three houses and converted them sixteen flats. The net assessment as ses was £147, and as flats £588. The ic contents were not increased, and 75 per t. of the gardens was taken away, so it ms to me that all that private enterprise is ng, by converting these houses, is to create rge income for the public authorities."

An Old Painter's Death.

fter working for the same firm for over y years, Thomas Lord Eldridge, aged 74. S. Templar-road, Homerton, collapsed while ting a scullery door at 7, Fenn-street, and in Hackney Infirmary. Deceased's em- er, Mr. George Huckett, house decorator, omerton-row, said Eldridge ceased work in ber, but as he was a very active man he l not rest, and worried because he had ing to do. Witness therefore gave him a job to occupy his mind.

e coroner remarked that it was a very good and showed more feeling for an old servant one sometimes saw. He recorded a ct of "Death from natural causes."

Anglo-Swedish Society.

e Anglo-Swedish Society, which has for ject the promotion of intercourse between eoples of Great Britain and Sweden, held eption at the Princes' Gallery, Piccadilly, uesday last, when the members and the s were presented to H.R.H. the Crown e of Sweden and Lady Louise Mount- n. Amongst those present were a er of people who have visited the Exhi- and Town-Planning Conference in nburg.

RATES OF WAGES IN THE BUILDING TRADE.

The following are the rates of wages in the building trade in England and Wales. Every endeavour is made to ensure accuracy, but we cannot be responsible for errors that may occur :—

	Masons.	Brick-layers.	Car-penters, Joiners.	Plas-terers.	Slaters.	Plum-bers.	Painters.	Brick-Masons' Labourers.	Plas-layers' terers Labourers.
Aberdare	1/7	1/7	1/7	1/7	1/7	1/7	1/7		1/2½
Accrington	1/7	1/7	1/7	1/7	1/7	1/7	1/7		1/2½

(For rates of wages in the Building Trade in Scotland, see page 464.)

CONTRACTS, COMPETITIONS, &c.

For some contracts still open, but not included in this List, see previous issues. Those with an asterisk are advertised in this number. Certain conditions beyond those given in the following information are imposed in some cases, such as that advertisers do not bind themselves to accept the lowest or any tender; that a fair wages clause shall be observed; that no allowance will be made for tenders; and that deposits are returned on receipt of a bona-fide tender unless stated to the contrary.

The date given at the commencement of each paragraph is the latest date when the tender, or the names of those willing to submit tenders, may be sent in; the name and address at the end is the person from whom or place where quantities, forms of tender, &c., may be obtained.

PROPOSED NEW BUILDINGS & OTHER WORKS.*

In these lists care is taken to ensure the accuracy of the information given, but it may occasionally happen that, owing to building owners taking the responsibility of commencing work before plans are finally approved by the local authorities, "proposed" works at the time of publication have been actually commenced. Abbreviations :—T.C. for Town Council; U.D.C. for Urban District Council; R.D.C for Rural District Council; E.C. for Education Committee; B.G. for Board of Guardians; L.C.C. for London County Council; B.C. for Borough Council; and P.C. for Parish Council.

ABERDEEN.—The T.C.'s Water Committee has agreed to proceed with the construction of a further section of the aqueduct from Crathes to Culter, at an estimated cost of £170,000. It was also agreed to construct a new intake at Cairnton at an estimated cost of £19,000.

ABERYSTWYTH.—The R.D.C. has received notification that the Ministry of Transport will make a grant of £1,500 toward the cost of reconstructing Rhiwarthen Bridge (estimate £3,000) and £250 toward similar work on Glanaber Bridge (estimate £500). The R.D.C. has submitted road schemes for grant totalling £8,188.——Plans passed by B.C. : Three houses in Prospect-place, for Mr. John Evans; three houses in Sea View-place, for Mr. W. Thomas; alterations to old Vicarage, Llanborden-road.

ALNWICK.—The U.D.C. has agreed to apply for permission to borrow £3,000 for the construction of filter beds for the Alnwick water supply.

ANSDELL.—Plans have been prepared for a new Baptist Church School; Mr. T. Harrison, of Accrington, the architect, and tenders are being invited.

AYLESBURY.—Plans passed by T.C. : Workshop, Havelock-street, Mr. P. R. E. Eaton, for Mr. C. E. Page; two houses, Fleet-street, for Mr. H. Witney; extension of storage, Education Sub-Office, Church-row, Mr. C. H. Riley, for the Bucks C.C.; eight houses, Tring-road, Mr. C. H. Wright, for Messrs. Hazell, Watson & Viney, Ltd.; boiler house, Aylesbury Steam Laundry, Mr. T. R. E. Eaton, for Mr. J. Robinson; house, Wendover-road, Mr. C. H. Wright, for Mrs. E. Wood; alterations and additions, laundry, Union House, Mr. F. Taylor, for Aylesbury Union; alterations, 23, Castle-street, Mr. C. H. Wright, for Mr. R. East; two houses, Havelock-street, Mr. Fleet, for Mr. A. W. Hadaway.

AYRSHIRE.—The Northern District Committee of Ayrshire C.C. has passed plans for the following new buildings in North Ayrshire: Cottage, Steenston-road, Kilwinning, for Mr. John Owens; bungalow, Stoneyholm-road, Kilbirnie, for Mr. John Grant; bungalow, Caldwell-road, West Kilbride, for Misses Fyfe; bungalow, Cochrane-street, Kilbirnie, for Mr. and Mrs. John Alexander; cottage, Redheugh, Kilbirnie, for Mr. Bryce M. Knox; cottage, Bowfield-road, West Kilbride, for Mrs. Mary Crawford Harper; house, Caldwell-road, West Kilbride, for Mr. W. A. Sloan; two slatted houses, Southannan, Fairlie, for Mr. W. N. O'Neil; cottages, South Cottage, Portencross, West Kilbride, for Mr. A. B. Allan; house, Fairlie-road, Largs, for Miss Helen M. W. Wotherspoon; conversion of three huts into six houses of four apartments each at Hut Colony, Kilbirnie.—Plans were also passed for several additions and alterations to dwelling-houses.

BARNET.—The U.D.C. has decided, subject to the consent of the Ministry of Health on the raising of a loan, to provide an open-air swimming bath for the town. A site on the Old Court House Estate has been suggested.

BARNSLEY.—Plans passed by T.C.: Wilson & Pongbottom, latrines, &c., to works, Nelson-street; T. Storrs, Barnsley Traction Co., extension to garage, Sheffield-road; T. Gaimster motor garage and store, York-street; Dr. Chapple, garage, Hunningley-lane, Stairfoot; T. Pearson, two houses, Westbourne-grove; Edmund Hoyland, bungalow, Dodworth-road; Mrs. J. M. Wright, bungalow, Ardsley-road, Stairfoot; G. W. Ambler, bungalow, Pontefract-road, near Cudworth Station; John Shillito, bungalow, Lund-lane; T. Ousling, bungalow, Fish Dam-lane, Monk Bretton; John Lawrence, bungalow, Gilroyd.——Tenders are invited for the erection of 44 houses on the Carlton-lane site. The Ministry of Health has sanctioned the borrowing of £12,590 for the erection of 36 houses on the Wilthorpe Estate.

BARTON.—It is stated that Messrs. Brooke, Bond & Co. will erect a large tea warehouse.

BATLEY.—The T.C. has passed a recommendation that certain property belonging to the Corporation, Nos. 33 to 45, Commercial-street (Batley's principal shopping thoroughfare), be demolished and the sites cleared.

BEDWELLTY.—The Consulting Electrical Engineer to the U.D.C. has submitted estimates of £4,090 for the proposed supply of electricity to Cefn Forest.

BELFAST.—The Unemployed Relief Grants Advisory Committee has approved conditionally of the erection of 2 parlour houses, Ravenhill Park-gardens, 8 parlour houses at Ormiston-crescent site, and 26 parlour houses at Old Park-road site, by the T.C.——The Northern Ireland Government has acquired the old Butter Market in Corporation-street as a site for a new Central Labour Exchange.

BELMONT (SURREY).—Part of the Belmont Workhouse is to be converted into a convalescent home for former inmates of London workhouse infirmaries.

BERWICK.—Plans passed by R.D.C.: House at Tremerston, for Mr. J. A. Kilpatrick.

BLACKBURN.—Plans passed by T.C.: House, Meinsfield, by Mr. F. L. Shorrock; addition to house, East Park-road, by Messrs. T. P. Willson & Sons, Ltd.; two houses, Gorse-road, by Messrs. McLeod & Butterworth; house, Green-lane, by Mr. J. Walmsley; house, Hardman-street, by Mr. Joshua Grimshaw; two houses, Featherbed-road, by Mr. H. Ibbotson; alterations, 25, Lord-street, by Mr. P. Nicoll; church, Briar Brow, by the Committee of Four-lanes End Congregational Church; cinema hall, Mincing-lane, for Mr. A. Bradley.

EW BUILDINGS IN SCOTLAND.

allan. — PUBLIC HALL. — Sir James , of Strathallan Castle, has offered to a public hall for the village of Strath- ear Auchterarder, Perthshire.

een.—CLUB.—Plans have been prepared . Watt, architect, 214, Union-street, for club in the east end of the town. The ee has applied to the T.C. for a site at h-west corner of the Gallowgate open

ss.—HOUSES.—The Linlithgow District tee of the Linlithgowshire C.C. has agreed a loan to the Kinneil Coal Co., Bo'ness, e them to carry out a housing scheme for ployees. They propose to build 100 nd the total cost is estimated at £30,000.

nch.—BATHS.—A site has been obtained e-street for the erection of the baths and ses for the Glasgow Corporation for the h and neighbouring districts. The for the buildings amount to about

k.— HOSPITAL.— Building operations commenced next week in connection erection of a cottage hospital at Midton

.—CHURCH.—Plans have been pre- the Lambert Memorial Church pro- be erected by the Sauchie and Fish- ted Free Church.

mline.—ALTERATIONS.—The Dean of rt has passed plans submitted by Mr. ess, Manbeath Colliery, for alterations ions to nine houses in Dundas-street,

en.—MEMORIAL.—The plans of the Hall and war memorial have been to the Streets and Roads Committee er the question of the line of the

her.—HOUSES.—The Eastern District e of Dumbarton C.C. has decided to houses, the cost of which is estimated 0. In addition to this scheme a 0 houses will be erected at Duntocher.

PROPOSED NEW BUILDINGS, &c.

(*Continued from p.* 467)

LONDON (HACKNEY).—Plans passed by B.C.: Drainage at factory, 24A, Sutton-place, for J. Hamilton & Son; additions, Clapton Laundry Co.'s premises, Evering-road, for S. Hayworth & Son; alterations, 7, Clapton Common, for J. Warden; factory, Somerford-grove, for H. Bradford & Son; additions, Snowflake Laundry premises, Tilia-road, for W. Silk & Son; warehouse, 14, Lower Clapton-road, for F. Bellenie; four shops, 271, Marc-street, for H. Dicksee.

LONDON (STOKE NEWINGTON). — Mission hall, Howard-road, for Mr. S. A. S. Yeo.

LONGBENTON.—Messrs. Bedson, Hall & Thompson, with Mr. Stephenson (architect), have interviewed the Council relative to the provision of sewerage facilities on the Benton Lodge Estate, where a large number of houses are to be erected.

MOUNTAIN ASH.—The U.D.C. has urged the Glamorgan County Council to expedite the putting in hand of the work of widening Cardiff-road.

NEATH.—The R.D.C. has made application to compulsorily acquire 2½ acres of land at Glynneath for erection of 16 houses.

NELSON.—The T.C. has decided to apply to the Electricity Commissioners for permission to install a turbo-generating set of 6,000 kilowatt capacity, at an estimated cost of £24,000, and for sanction to borrow the sum from the Unemployment Grants Committee of the Ministry of Health. Mr. A. Edmondson, owner of Dobson House Farm, and Mr. H. M. Walton, owner of the Chapel House estate, have submitted proposals to the T.C. to erect dwelling-houses on their estates subject to satisfactory financial assistance being granted in pursuance of the Housing Act, 1923. The Council deferred the matter. Mr. A. Edmondson is proposing to erect nine houses in Pont-street. The Nelson Co-operative and Industrial Society are proposing alterations to premises, 1-3, Railway-street.

NEWCASTLE.—Plans have been passed by the Town Improvement and Streets' Committee for the erection of a motor garage to hold 50 cars, on the Milvain Estate, Westgate Road. The architect is Mr. T. K. White, of 55, Pilgrim-street, Newcastle.—With the object of stimulating the erection of better class houses by private enterprise, the Newcastle T.C. has adopted a recommendation from its Housing Committee allocating 25 acres of the High Heaton Housing Estate for erection of privately-owned houses. The land was originally purchased by the Corporation for housing purposes, and the step has been taken in view of the Ministry's refusal to sanction further municipal schemes for the present. The estate is to be developed on modern lines, and about 300 houses will be built.

NEWPORT (MON).—The Corporation is formulating a scheme for the conversion of the premises, "Clytha," Park-road, and Bryngwyn Nursing Home, which adjoins, and are to be purchased, leasehold, at £3,425.

PENARTH.—The Penarth U.D.C. has been offered, and accepted, the gift of Beecroft, Stanwell-road, from Capt. Jenkins for conversion to a child welfare and maternity centre. The Council has decided to press for sanction to erection of further municipal houses on the ground that cottagers' needs are not adequately met by private enterprise. Messrs. David Davies & Sons have applied to U.D.C. for land for erection of houses. The Dinas Powis Parish Council has received notification that land for Eastbrook recreation scheme will be placed at its disposal subject to building of wall, 6 ft. high, at northern and eastern boundaries. This is estimated to cost £800 to £1,000.

PURLEY.—A movement is on foot to provide a permanent building for Purley Men's Club, the cost being estimated at £5,000.

REIGATE.—The R.D.C. has decided that 211 new houses are required in the area, and it has been decided to offer inducements to private builders to erect them.

RHONDDA.—The Education Committee has instructed preparation of plans for additions to Pentre Secondary School.

RICHMOND (SURREY).—The Red Lion-street area has, it is reported, been disposed of to a syndicate, and plans are being prepared in connection with the scheme and will be shortly presented to the Highways Committee of the T.C. It is proposed to erect 20 first-class shops. Messrs. Yates, Cook & Darbyshire are the architects.

SALE.—The U.D.C. have instructed their surveyor to prepare plans and obtain estimates for the erection of a new and permanent bandstand in the park.

SCULCOATES.—Plans have been passed by the R.D.C. for 118 houses on Hedon-road. They were submitted by Mr. J. Emmerson, who asked the Council to increase the subsidy to £25 per house, in accordance with their powers, on account of the extra cost of labour and the carriage of materials. The matter was referred to the Housing Committee.

SEATON CAREW.—A scheme for developing this little seaside resort near West Hartlepool, at an estimated cost of £42,000, is making headway.

SHARDLOW.—The B.G. has decided to erect a new infirmary.

SHEFFIELD.—Plans passed: 12 houses, Handsworth Estate, for Estates Committee, Corporation; 10 houses, Woodhouse Estate, for Estates Committee, Corporation; two houses, saleshops, workshops, and garage, Middlewood-road, for Mr. Fred Arundel; two houses, School Green-lane, for Mr. W. F. Hides; two houses, Rundle-road, for Messrs. Dyson & Co.; bungalow, road off Abbey-lane, for Mr. F. Wolstenholme; bungalow, Muskoka-drive, for Mr. G. M. Taylor; house, Ringinglowe-road, for Mr. L. L. Allen; house, Kennedy and Chatfield-roads, for Messrs. S. Higton & Sons bungalow, Abbey-lane and Bocking-lane, for Mr. James; four houses, School Green-lane, for Mr. R. Blenkhorne; house, Sandford-grove-road, for Mr W. A. Knight; house, School Green-lane, for Mr. E. V. Wolstenholme; house, off Abbey-lane, for Mr. J. V. Auckland; two houses, Archer-lane, for Mr. J. J. Hawksworth; four houses, Norton Lees-lane, for Messrs. Hammett & Co.; two houses and garage, Whirlowdale-road, for Mr. T. H. Bailey; bungalow, School Green-lane, for Mr. H. Belk.

SOWERBY BRIDGE.—The U.D.C. is making application to the Ministry of Health for sanction to borrow £4,510 in order to build 14 houses on the Albert-road, site. The Council hope to sell these houses, which will be built to suit customers' requirements.

STAINFORTH.—The Thorne Education Committee has decided to erect a new school at Stainforth, with accommodation for 1,000 children.

STALYBRIDGE.—The T.C. is seeking sanction for borrowing £9,040 for street improvements, and £4,650 for a new road from Harrison-street to Cambridge-street and Church-walk, as relief work.

STOKESLEY.—Plans approved for two houses at Hutton Rudby, for Mr. J. Bartram; new bungalow, Great Broughton, Mrs. Fawcett, has been approved by the R.D.C.

EXTERNAL TEXTURAL FINISH OF CONCRETE BUILDINGS.

On the morning of Thursday of this week Mr. Frederic Coleman gave an illustrated lecture at the West End Cinema in Coventry-street. The lecturer's general subject was the external textural finish of concrete buildings and structures of various sorts. He showed a film on stucco textures, showing the possibilities that are inherent in a stucco made from white Portland cement. His theme was beauty and the application of a plastic surface to our buildings—a plastic exterior hardening into stone, in unlimited variations of colour and textures. The film showed not only the finishes that can be obtained, but how simply they can be secured. The tones of the buildings shown in the film were made possible, he claimed, by the use of white Portland cement, which provided the white neutral colour on and with which the colour effects were built up. The textures shown and described were obtained by the use of ordinary tools. He pointed out that the texture should always be the result of the application of the stucco rather than the manipulation of the stucco to obtain the effect; the first was natural, true, and honest, and the latter was a straining after an effect, and the straining would show more than the effect.

After illustrating sheathed-frame construction, back-plaster construction, and the application of stucco to masonry, a workman was shown applying both simple and textural finishes one after another. A dozen residences of various sorts were shown on the screen, each finished in a different manner. After the pictures of the houses and a close view of the textural finish had been given, the workman was shown carrying out the actual manipulation which provided that particular finish. As an object lesson of how stucco work should be done this was admirable.

The lecturer then dealt at some length with a magnificent piece of concrete statuary recently completed in Chicago, called the "Fountain of Time." He read a portion of an address by the sculptor, Mr. Lorado Taft, and several explanatory notes by Mr. J. J. Earley, who carried out the work. The series of photographs of the finished piece showing the methods of construction, and close views giving an idea of the architectural lines and the textural finish of the group, were much appreciated by the audience. Next came a series of coloured photographs, taken in two beautiful gardens in the vicinity of Boston. Swimming-pools, fountains, balustrades, stairways, pergolas, and summer houses in white Portland cement were shown to excellent advantage.

The lecturer then showed a number of pictures of work in London and other parts of England in which white Portland cement had been used in the form of stucco or cast stone. Finally, he produced a couple of score of illustrations of the best class of cast-stone work in America. Intermingled with these were pictures of some American architectural works of the last few years.

The lecture will be given for a second and last time at the West End Cinema in Coventry-street on the morning of Thursday next, September 27.

TRADE NEWS.

Messrs. Joseph H. Bradshaw, Ltd., asphalte importers and contractors, have removed from 34, John Dalton-street, Manchester, to 4, St. Mary's Parsonage, Deansgate, Manchester (Telephone: Central 4359).

Messrs. Luckwood & Kesterton, wholesale builders' merchants, of Sentinel House, Southampton-row, W.C.1, have taken showrooms, offices and warehouse at 44-46, Eagle-street, Holborn, W.C.

Preston Corporation (Surveyor, Mr. J. S. Bullough, A.M.I.C.E., M.I.M. and Cy.E.) have placed the surfacing work in connection with their new arterial road in the hands of Messrs. William Shepherd & Sons, Ltd., Milkstone, Rochdale.

An informative booklet is issued by the Spedol Manufacturing Co., Ltd., of Brentford, Middlesex. It gives full information about the firm's manufactures, which include, in addition to high-grade paints, varnishes, liquid dryers, "Spemac" enamels, and the well-known rust-resisting coating marketed under the title of "Ferroarmor." A copy will be posted free upon application to the Spedol Manufacturing Co., Ltd., Brentford.

The increased use of road transport with heavily-laden lorries often causes plaster work to crack and fall. A thoroughly seasoned wood pulp board, however, if properly fixed, should be a permanently satisfactory substitute for lath and plaster. The weight alone is an important factor, as a quarter-inch thick lining weighs about one-fifth of the ordinary coating of plaster. White "Sundeala" boards are light in weight, as the method of manufacturing in a homogeneous mass makes the sheets very rigid and firm. The material, being waterproofed, is easily decorated without the liability of absorbing moisture and causing buckling.

STOCKTON.—For erection of a new gas-holder with a capacity of 8,000,000 cu. ft., for the Montreal Light Heat & Power Co. :—

*Ashmore, Benson, Pease & Co.	£100,000

WHITWORTH.—For the rebuilding of Lloyd-street School, Whitworth :—

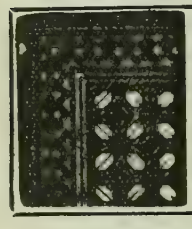
*_Building_—Sutcliffe Bros., Whitworth.
*_Iron ork, floor and roof_—Webb Bros., Bury.
*_Tiling and flooring_—Wild Bros., Rochdale.

WIGAN.—For the supply and installation at the Wigan Corporation Gas Works of modern horizontal retorts with coal and coke handling plants :—

*Drakes, Ltd., Halifax.

A Builder's Estate.

Mr. John Joseph Inward, of 29, Endymion-road, Finsbury Park, N., of Messrs. Inward & Lovell, builders, left £19,100.



The Housing Subsidy.

Grants of £100 per house are to be offered to builders and owner occupiers by the Carlisle Corporation in connection with the Government's new housing policy.

Under the Government's new scheme the West Hartlepool T.C. proposes to erect an additional 36 houses by direct labour, and to invite local builders to tender for a further 18. A subsidy varying from £80 to £100 is to be offered for houses built by private enterprise.

The Mid and North Northumberland Master Builders' and Allied Trades' Association has decided to appoint a committee to consider the application of the Housing Act, 1923, in the area covered by the organisation, which extends from Ashington, through Bedlington, Choppington and Morpeth, up to Berwick, with a desire to prepare, or assist in preparing, schemes and to confer with local authorities in order to carry the Act to an effective issue.

The Greasborough Urban Council has decided, with a view to stimulating building by private enterprise, to offer a subsidy of £100 a house.

THE BUILDER

JOURNAL FOR THE ARCHITECT AND CONSTRUCTOR.

WITH WHICH IS INCORPORATED "THE BRITISH ARCHITECT."

OL CXXV.—No. 4208. SEPTEMBER 28, 1923

HEATING AND VENTILATION.

ABOUT half our British year is cold enough to make artificial warmth in dwellings and workplaces distinctly desirable if not absolutely essential to health and efficiency, and with the return of shorter days and lower temperatures the subject of heating and heating appliances again claims attention. absolute decision as to the best method of heating and ilating buildings is ever arrived at, however, for our climate, gh extremely variable, is not severe enough to provide the ulus needed to drive all parties among a people of such ngly individualist character as the British to any general ement on the subject.

The most conclusive demonstration of the fitness and ing economy of any special apparatus is liable to count ittle where it is possible to drift along in the old way and omforted with the reflection that after all "the open fire s the most cheerful." And so it is that the open fire ains the most usual form of heating and ventilating appliance se in these islands.

Considerations of economy and the desirability of minimis- the nuisance caused by soot and smoke may eventually to the amendment or the suppression of open fires, but they have managed to outlast the coal shortage caused he war, when so much governmental interference with ate affairs was tolerated by the restive but patriotic house- er, there seems small chance of their speedy abolition.

Fashions are capricious, however, and England may fasten affections upon central heating now that America is showing of getting weary of it, for, after having given it a long enthusiastic trial, medical men in America are condemning ned air methods of ventilation as being productive of tude and loss of energy. That this is the case most ellers seem to agree, but it is too early yet to pronounce al verdict, and many Americans are still fond of their steam hot-water systems as well as of their hot-air furnaces and id them by pointing out that they modify the rigours of winter as the open fire could not.

Whatever disadvantages central heating may have, and if eyes and sallow cheeks are to be charged to its discredit are not to be disregarded, it has the merit of reducing elching out of foul smoke which disfigures architecture furniture with constantly renewed coatings of grime. is an important consideration, for though London suffers what less than the great manufacturing cities of the nds and the North where conditions are appalling, and h she is saved some discomfort through the fact that evailing winds blow from the residential districts towards tories on the north and east of the city, even in London as to be reckoned with as taking a prominent part, even oes not set the key of every architectural colour scheme. high time that this disgusting and ridiculous state of should be done away with in the interests both of e and of artistic propriety.

e discharge of smoke in large quantities is a double of the open fire, since the particles of unconsumed fuel pollute the atmosphere are lost to heat production. forms of slow-combustion grate have proved their r power of transforming fuel into useful heat, but their nt qualities are not sufficiently recognised to obtain m exclusive use in the face of competition of slightly pensive grates or of grates which may be somewhat of installation. Failing personal experience, there to guide the architect in the matter, and choice is too irected towards the selection of a pleasant-looking nd" than determined by keen scientific inquiry into itive working efficiency of the grate considered as a apparatus. So little do some architects who select r some manufacturers who produce them consider the onditions of their service that among the many types iors on the market few indeed are fitted with ash-pans ollect all the ashes and allow of their removal without to the use of dustpan and hearth-brush. Since some manufacturers have realised this simple and obvious requirement of a heating apparatus depending upon the combustion of coal there seems to be no reason why others should not follow suit, though as the present ill-fitting types of ash-pan find a ready sale the alteration may have to wait for woman to make her voice heard in connection with architectural fittings.

Some conscientious architects, horrified at the magnitude of the nuisance created by coal smoke, advocate a return to the use of wood fires in cities, and have had special hearths for burning wood installed in their own offices by way of making example square with precept. The results are delightful in appearance, and good heat can be maintained, but the reasons which led to the substitution of coal for wood as fuel some centuries back probably apply with even greater force to-day, now that so much of our small remaining forest has been felled, and the substitution of wood for coal is not likely to become general.

As a ventilating appliance the open fire has a distinct value, as is recognised in the by-law which requires ventilating gratings to be provided in rooms built without chimneys and, fortunately, the chimney that is placed in a suitable position for the avoidance of draughts from door and window is also the one that draws best without emitting smoke in whirls and gusts into the room. The demand for special installations of radiators or other types of heating is greatly increased by the careless planning and detailing so often met with in ordinary dwelling houses, for a good slow-combustion grate, well placed in relation to windows, provided with means of ventilation six feet above floor level, can maintain a comfortable state of warmth on a cold day in a way that would be quite impossible with an inferior fireplace indifferently placed in regard to doors and windows, especially if the only means of ventilation are provided low down by side-hung casements or French doors.

Gas fires provided with flues of much smaller sectional area than those used for coal fires and of restricted height have been installed in many houses built recently, with the object of reducing both the first cost in construction and of future labour in running the house. These two points are undoubtedly worthy of consideration, but care should be exercised to see that the flue has efficient updraught, or the poisonous fumes may be discharged into the room with tragic results, such as are so frequently reported in the daily newspapers.

In conjunction with gas stoves for cooking and heating, an independent boiler is often employed to perform a certain amount of heating work and to supply hot water for domestic purposes. The boiler is generally fired with coke or coke-and-coal mixture, and the heating functions are performed by means of a circuit of pipes and radiators supplied from a hot-water cylinder. It is claimed for this method that it is more economical both in fuel and in labour than a boiler affixed to the kitchen range, but the rival merits are pretty nearly balanced since, with the use of both boiler and gas stove, two objects have to be attended to and cleaned instead of one; and special fuel has to be stored for heating the boiler. The old-fashioned kitchen range is supposed to be under a cloud at the moment, but cooking by gas on a Sunday, when all the neighbours are attempting to do the same, and the pressure is not adequately maintained, can also be vexatious. Every housewife has her own opinion as to which alternative is the worse.

Electricity as a heating agent is not yet a practical proposition, not because excellent and efficient stoves have not been made, but because electricity when made in our muddle-headed and wasteful English way is far too precious for the purpose. "Backward" countries like Spain can light the peasant's hut and even the gipsy's cave with electricity by harnessing the natural water power of quite small brooks, whereas we make electricity by first burning some other fuel, such as coal, and incidentally provide the landscape with handsome factory chimneys to discharge the smoke!

NOTES.

Influence of the Church Congress.

If dual Presidents are any criterion, this year's Church Congress at Plymouth is an important one. The subject matter generally seems to avoid controversy, even though it fails to include certain important points in the application of Christianity to modern thought and education, industry, business and civic life. To comprehend the scope of religion without a deeper understanding of the nature of art, or to appreciate the particular dangers in the conduct of industry divorced from it, is to expect the impossible, and yet we hardly suppose the subject of art, and the need of beauty, exercises much influence over the discussions. But the subject is one deeply exercising the minds of people at the present time, and there are, no doubt, among the clergy those who feel the importance of it, so that in considering the influence of the Church Congress we are bound to look at this side of the matter; and if the importance of beauty as the expression almost of the religious life of a people is disregarded, we must hope future Congresses will realise that it should no longer be neglected.

Celtic Cross at Termonfechin Church.

The New and the Old.

We have each year a Church Congress Exhibition, including a loan collection of ancient and historical examples and an exhibition of modern work. It is always easy to criticise one at the expense of the other, to point to the beauty of the old work and to make unfavourable comparisons with the new. There is a quality in mere age which influences us, and this must be discounted. But there is a difference no less between the new and the old, perhaps as much due as anything else to the industrial era, to the new directions and purposes in our labour, and the new kinds of reward sought for it. A much more humble attitude towards the reward for labour existed in old days because there lay so much reward in the work itself. Nor is it only the machine that has made the difference. We ourselves have become so mechanically minded as to be but part of a greater machine.

"World Price."

There are one or two passages in Mr. P. J. Pybus's article in *The Times* of the 21st instant, in which he replies to critics of his former articles on "Payment by Results," which have a wider application than to any particular system, but which bear on the conditions of the trade of this country generally, whatever may be the system adopted, and they deserve special attention as they are admirably expressed. We venture to quote one or two passages. Thus Mr. Pybus states: "What is the one fundamental fact which British industry has to face? It is that for the greater part of our products there is a maximum attainable world price, subject to slight variations for quality, but otherwise determined by factors beyond our control. If we have prospered in the past it is because we have produced goods not inferior in quality at a price not higher than the world price. If we are to prosper in the future, if we are even to survive as an industrial nation, it can only be on the same condition. We may discuss the need for benevolence or the virtues of profit sharing till the heavens fall, but we cannot thereby create any immunity from the constant pressure of that limiting fact, or ensure that those who can see it in a false perspective will have any profits to share." This has been the text we have been preaching for many years, but Mr. Pybus has stated the text and the sermon in nutshell. We are parochial in industri affairs, and act as though we were fr to handicap our industries in every w by local considerations, and yet thi that trade will be secured. It is necessa that legislators, local authorities, e ployers, employed, and trade unio should recognise the truth thus express by Mr. Pybus, that the first necessity to consider the world price and th to regulate our industrial conditio accordingly. There are other passa worth considering in this article. F instance, Mr. Pybus states: "I belie that in normal times it would be true say that a decrease in the cost of a produ represented by quite a small percenta would very greatly increase this country share of the world's work."

Piece-Work and Tools.

One other passage in t article on another point see worthy of attention as bei suggestive to employers. Pybus says: "I remember the introdu tion of piece-work in a large engineeri factory, and on the morning on which was started there was an overwhelmi demand for new cutting tools, for overhaul of lathes, and a general grumbl about the condition of the plant on wh the workmen had operated for ye without complaint. Up to that time was the employer's business to see t every modern device was employed, when the workman started for him he wanted everything which could duce accurately and quickly." country stands in a critical condition a its trade, but all thinking people n recognise three of the essentials to se the world's trade: Excellent quality creased production and freedom vexatious restrictions and impractic burdens. How are these three essen to be secured? Three things, at rate, are clear: (1) A system of emp ment which will make the work give of his best and not strive to output, (2) suitable reward for his la energies and capacity, and (3) the possible plant to work with.

Daylight Saving.

A good deal of discont being shown at the discontinuance of "Su Time" this year unde new Act, but people will ruin thei cause if they are so extreme as to adv both an extension of the time adv to two hours and the commencem Summer Time at an earlier date, as its continuance to a later date. It be remembered that "daylight savin to a large extent an economic m and its economic effect in saving l most marked in the Autumn. Si introduction Summer Time has on

[This memorial was recently unveiled by General Petain.]

nated once so early as this year, as in 17 it terminated on September 17, and think as the Act is one which has to renewed each year a good case could be de out for the extension of Summer ne, at any rate until the end of Sep-ber. Probably the date adopted in Act for its commencement is quite isfactory, "the day following the third urday in April," which this year was ril 22, but after the experience of this r few people will be found to advocate unnecessary change so early as Sep-ber 16. It is true under the Act it is sible the date may work out six days r than it did this year, but any date re September 30 is too early.

---

t. Bar-olomew Great.

The completion of the excavations in the cloisters of this church, the oldest church in London, is a step further ards its complete restoration, nothing remaining but to restore the vaulting he East Cloister, for which the sum bout £4,000 is needed. We hope this may be soon forthcoming to crown effort which has been continued for last thirty-eight years, and has led he recovery of a church of the twelfth ury, dating, as it does, from 1123. It nus older than Westminster Abbey. interesting fact in connection with e excavations is the raising of the ace of the earth through the deposits of time. Mr. E. A. Webb, in an interesting account of his work at the church in co-operation with Sir Aston Webb, P.R.A., tells us that "In the City of London many of the old buildings have sunk from 16 to 18 ft. below the surface since the Reformation. Bow Church is 16 to 18 ft. below the surface of the road." In excavating the Cloisters of St. Bartholomew's Church they had to remove about 7 ft. of earth from the floor.

An Architect's Indictment of Coal Smoke.

This is the title of a spirited article by Professor C. H. Reilly in the Gas Industries Number (2) of *The Manchester Guardian*, published on the 24th inst. He draws an idyllic, almost a fanciful, picture of such a city as Manchester as it might be "if the tons of tarry acids and soot from their domestic chimneys" went down the sewers instead of falling on our persons and our buildings. "They would, one may be sure, be towns of peculiar beauty, a beauty, too, very different from that of the sunny towns of the Mediterranean. Instead of the bright colours belonging to a lower latitude, we should have the far more beautiful half-tones and pearly-greys belonging to our northern climate. Our buildings to correspond would have to be more delicately modelled, with less strongly marked shadows. Deep porticoes would rarely be used save to mark points of special importance. The architect, instead of being a man accustomed to think in black lines, would become sensitive, not only to every shade of colour, but to every modulation of surface and texture. No longer could we tolerate the hard, bright reds of our machine-made pressed bricks. The black joints, too, in which we set our brickwork, grinding cinders into our mortar where the south uses sand, would seem to be what they are, so many dirty lines drawn across the fair faces of our buildings, and thereby adding most unnecessarily to the gloom. A vulgar moulding, too, an over-emphasised piece of ornament, would become so conspicuous in proper daylight, when all the surroundings would be clean, that the author of it would begin to be cut by his fellow architects and even his lay friends as a man of bad and flamboyant taste." We are glad to think that the effects of smoke are being recognised, and that greater interest is being taken in the matter.

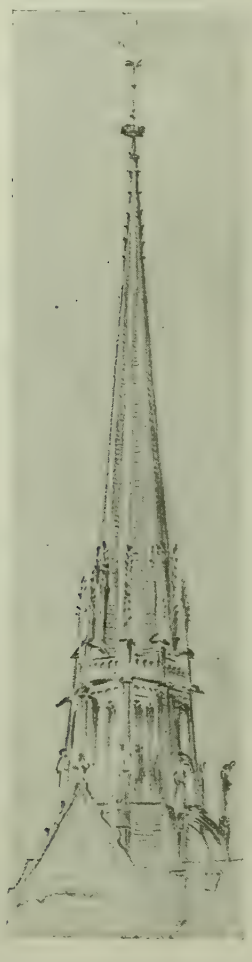
Figure of Marie Madeleine in the Cluny Museum, Paris.

GENERAL NEWS.

Professional Announcements.

The partnership between Messrs. T. Brammall Daniel, F.R.I.B.A., and H. W. Parnacott, A.R.I.B.A., of Members' Mansions, 36, Victoria-street, Westminster, S.W.1, will come to a close, by mutual consent of the partners, on September 29. On and after September 30, Mr. T. Brammall Daniel will continue to practise at Members' Mansions, 36, Victoria-street, Westminster, S.W.1.

Mr. Charles M. C. Armstrong, F.R.I.B.A., architect, has changed his address from 5, High-street to 39, High-street, Warwick. Tele phone 194.



Mr. W. A. Goss has commenced practice as an architect and surveyor at Teignmouth and Dawlish. Manufacturers, &c., are invited to forward catalogues of building and engineering specialities to 18A, Orchard-gardens, Teignmouth, S. Devon.

Appointment.

In view of the new works to be undertaken by the Carmarthenshire County Education Authority, at an estimated cost of £150,000, a new assistant to the County Architect, at a salary of £500 per annum, has been decided upon. The post will be for six or twelve months.

Swansea University College.

Swansea Town Council has decided to apply for a provisional order to enable them to advance £50,000 to the University College of Swansea. The Town Council have already given Singleton Abbey and a certain amount of land to the College. The Corporation bought the Singleton estate a few years ago from the late Lord Swansea for £100,000.

Fleche at St. Benigne, Dijon.
From a Sketch by Mr. G. Norburn.

Recent Excavations.

Lectures on recent excavations in Mesopotamia, Egypt, and the Mediterranean, showing the evolution of architecture from the fourth millennium to Roman and early Christian times, will be given by Miss Claire Gaudet at the British Museum on Thursdays at 4.30 p.m., beginning on Thursday next. Application for tickets should be made to the Hon. Secretary, "Recent Excavations," 120, Cheyne Walk, Chelsea, S.W. 10.

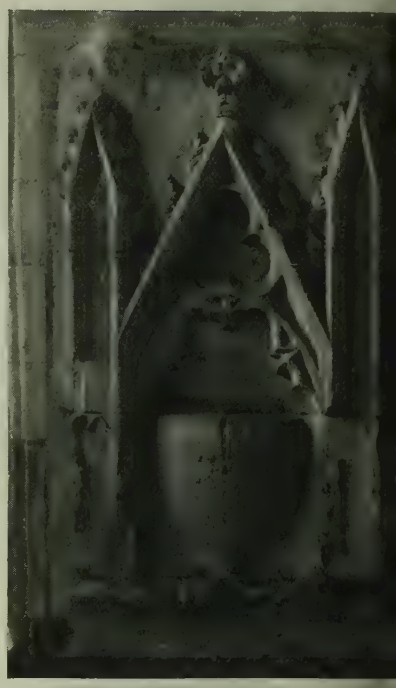
Rebuilding the Bank of England.

Referring to the rebuilding of the Bank of England, at the half-yearly court of proprietors, Mr. S. P. Derbyshire raised the question of the advisability of retaining the outer walls of the building. The Chairman, Mr. M. C. Norman, said that, as he understood the position, they were committed to no definite and final decision. He was also of opinion that the outside walls of the bank were the only part of the building which had become really historical, and added that in the plans under observation the question of retaining these walls was being considered.

Kinghorn Memorial.

At Kinghorn last Saturday the recently completed war memorial was unveiled and dedicated. The Lord-Lieutenant of Fife performed the ceremony, and General Sir Robert Hutchinson, M.P. for the Kirkcaldy Burghs, on behalf of the subscribers, formally handed over the memorial to the Town Council. Mr. William Williamson (Kirkcaldy) was architect of the work, which is entirely of Cullaloe stone; and the sculptor was Mr. Alexander Carrick, A.R.S.A. (Edinburgh). No fewer than 60 names are inscribed on the memorial, which has been erected at the Port, opposite Rossland U.F. Church.

The Royal Archæological Institute.



Members of the Royal Archæological Institute will visit the Inns of Court on Thursday, under the guidance of Mr. W. H. Godfrey, F.S.A. The meeting has been organised by Mr. V. B. Crowther-Beynon, F.S.A., and Mr. A. T. Bolton. The members will assemble at 10.30 a.m. at Gray's Inn (East Gate), and later cross Holborn and proceed to Barnard's Inn (now Mercer's School). Then, in turn, will be visited Staple Inn, the Record Office, the remains of the Rolls Chapel, Lincoln's Inn, Clifford's Inn, Inner Temple, Temple Church, Fountain-court, Essex-court, and New-court. Those wishing to attend the meeting should write at once to Mr. Bolton, 19, Bloomsbury-square, W.C.1.

York Archæological Society.

Members of the York Archæological Society had an interesting outing, organised by the Joint Hon. Secretaries, Mr. W. A. Evelyn and Miss M. Leaf, the venue being Byland Abbey, where valuable discoveries have been made as the result of excavations carried out under the supervision of Mr. C. R. Peers, Chief Inspector of Ancient Monuments. Mr. Peers conducted the party and pointed out some tile work in the presbytery and south transept, which, he said, was the most complete work of its kind yet discovered. Greetings were exchanged with the Durham and Northumberland Archæological Society, who were also paying a visit to the Abbey.

Town-Planning Institute.

The Fifth Annual Conference of the Town-Planning Institute will be held at York, from October 5 to 7. The programme is as follows:—Friday, October 5—Paper by Mr. George Benson, A.R.I.B.A., on "The Evolution of the City of York"; Paper by the City Engineer, Mr. F. W. Spurr, on "The Town-Planning Proposals of the City of York"; Paper by Mr. F. C. Mears, on "The Planning of Mediæval Cities"; Visits to places of interest in the city; Reception at the Guildhall. Saturday, October 6—Visit to New Earswick Model Village; Dinner at the Station Hotel. Sunday, October 7—Char-a-banc excursion to a place of archæological interest near York.

"Heart" Tomb at Braborne Church, Ke
[This is described as a "heart" tomb, but appears to be a shield. It is stated that the is only one other "heart" tomb in existe in this country.]

COMPETITION NEW

New Offices for Holt Line.

Messrs. Briggs, Thornely & Rowse, F. A.R.I.B.A., of Liverpool, have been award first place in the competition for the new offi for the Holt Line. Other competitors were Edwin Cooper, F.R.I.B.A., Messrs. A. J. Da F.R.I.B.A., W. Curtis Green, F.R.I.B.A., a Willink & Dod, F. & A.R.I.B.A. The asses was Mr. G. Gilbert Scott, R.A. The success architects are well known, Mr. Arnold Thorn being the architect for the new Parliam buildings, Belfast; Mr. H. J. Rowse is old student of the Liverpool School of Ar tecture. About ten years ago he was top of year and appropriately enough, as it turns he won the Holt Travelling Studentship. went to Winnipeg to make the working drawi of the Parliament Buildings, Winnipeg, M toba, of which Mr. F. W. Simon, F.R.I.B was the architect.

Masonic Temple, Birmingham.

Sir Banister F. Fletcher, F.R.I.B.A., assessor in the competition for designs for new Masonic building in Broad-street, Birmi ham, for the Provincial Grand Lodge of W wickshire, has made the following award Winning design (premium £500), Mr. Ru Savage, F.R.I.B.A., P.M., Howe Lodge; sec premium (£300), Mr. S. N. Cooke, F.R.I.B P.M., Grosvenor Lodge; third premium (£2 Bro. Hurley Robinson, Bedford Lodge. design placed first is illustrated on pp. 48 and the assessor's report is given on p. 48

Bridge over the River Medlock, Limehur

For the R.D.C.—Designs for a bridge the River Medlock. Sending-in date, Octobe Mr. Reg. Thompson, Council, Ashton-under-L

Taunton.

Designs for a war memorial, for the Counc Taunton School. Sending-in day, Novembe Conditions may be seen at *The Builder* O (See our issue for September 21.)

Other Competitions.

PLYMOUTH.

BY A. E. RICHARDSON, F.R.I.B.A.

HE famed but untitular capital of the West ntry lies screened from the sea between two hty headlands, its topography clearly seen the height of Dartmoor, yet mysterious on er approach. It is a curious situation, none better could have been chosen for ing the most of an intricate water front. nouth is not ancient as towns go, although visage is grey. She has parts that to ern eyes may pass for antiquity and carries ok of establishment that defies scrutiny and s interest to her years. It is impossible to where the boundaries of the town begin and re they end, for the secret is guarded well. e was when Drake's captains had to feel r way cautiously into the Cattewater; and the great Medina-Sidonia lumbering up to is did not deign to throw in a few round s, such was the remoteness of the Tudor port. s changed. The heart of the town has dilated new centre, tentacles have been thrown out nclude erstwhile villages, the foreshore is ged with terraced walks, wharves and ature harbours for eight miles; and at t both strand and towering heights show s that twinkle out to the deeps like candles ballroom. From the Hoe, Plymouth views broad sea and marks at sunset the paths to New England which she has helped to create. west may be seen the far-flung beams of Eddystone, and beyond the soft contours of wall thrust outwards and upwards in nce of Neptune. From the Hoe, too, you look backwards to the blue of Dartmoor, hed in clouds and damp with the mists. nouth is a cradling place for all who prepare he sea; she has no right to quarter-deck s, whatever claims are put forth by Stone- e and Devonport. She is rather in the tion of leader of a flotilla—all of which characteristics in common. In fact, ered from the storms that rage, she is to withstand drenching rains and damp s, hence the prevalent tint of grey—the red granite, the close shingling of slate, the skin of stucco, immuning local thought ie theory of a perpetual weather coat. No r seaport in England is like Plymouth, has the same cleanliness; not one can boast ich marble pavements or such perpetual g cleaning free from charges on the rates. oaching Plymouth from the sea, one slips the Sound as into a bed of down after a f hard work. There is not much to indicate presence of a town of the first size; the el is toylike. The stump of Smeaton's house seems like an oak shorn of its branches; houses on the summit of the Hoe have ng of Continental magnificence. There is, ver, something of mystery in the direction tton Pool, and to the west, where the aze opens out, beyond Drake's Island, than a suspicion of activity.

proached by rail from the direction of r, Plymouth presents a skyscape of infinite ; there are the clouds that race from a above the murk, the aspect of railway s, the shrill cries of locomotives that call ne to the other, a glimpse of houses that p and down hill, a vision of skiff masts, e with pulley blocks that carry gay strings shing to decorate back yards. Small r is it that passengers who have been l for four hours within the confines of a rtment should experience quickening ons between Plympton and North-road. y are those who journey onwards by rail, m Plymouth to Saltash they gain ideas ography from bridges and viaducts that ce selections of chimney pots, fighting funnels, depots and other paraphernalia. ilway, if the term is allowed, bisects the towns, and far from revealing the secret garrison, makes the passage endless. much for two methods of studying local aphy. The best remains, and that is k through the streets and read the build- or Plymouth inspires with a message that is far from provincial, for her attraction has to do with the sea. In this sense, she is feminine to a degree—the true lover of a sailor or a marine, the "Sweet Poll of the West Country," a lover of many pleasant memories. In the past many among the great ones in our Island story have trod the stones of old Plymouth, or paced the newer pavements. Here have foregathered merchant venturers and daring captains, hereabouts men have plotted to keep their lawful King outside the walls, here some have made a stand against religious persecution, and from these quays the founders of modern America took their last leave of the country that had no use for their zeal. Admirals and generals, statesmen and artists, kings, conquerors and captives have each in turn come within the spell. What must have been Napoleon's thoughts when, anchored out in the Sound, he looked down on the Lilliputians who swarmed round the ship?

Most people imagine that Plymouth is a modern place with buildings of little interest. This is a fallacy. On the contrary, the buildings of Plymouth, like the indigenous materials, have a character entirely their own. A type of Dorian simplicity, a breadth of handling that give the streets the assay mark of quality. There are the Elizabethan houses near Sutton Pool, the matured Georgian houses of Durnford-street haunted by the shades of admirals whose names are forgotten save in the muniment rooms at the Admiralty, the stucco crescents and terraces fashioned by Foulston and Wightwell, the quasi-mediæval shaping of the municipal buildings and the scale of the hospital and barracks. And while you are looking around taking in all these things, admiring perhaps the portico of the Theatre Royal and musing on the fact that Sir Joshua Reynolds was born at Plympton two centuries ago, there comes to mind the fact that Plymouth has to do with national defence, and that not the least of her townspeople are the sailors and soldiers who claim the town as their own.

Dundry Tower, near Bristol.

CORRESPONDENCE.

Preservation of Somerset Church Towers.

SIR,—The photo here reproduced will be recognised by your Bristol readers as the famous Dundry Church Tower. It was built during the sixteenth century by the Merchant Venturers of Bristol. It stands about 700 feet above sea-level, and the old cross to the left is thirteenth-century work. Having occasion to mount to the top of the tower, my attention was drawn to four flying buttresses built diagonally behind the four principal pinnacles.

The base of these buttresses is 8 ins. square, and apparently they spring from squinch arches below the leads. During a restoration a few years since the base of these buttresses was pierced and a 1-in. iron tie rod inserted, connecting the north and south buttresses.

It only requires a little time for the iron to oxidise and burst the stone. It seemed hardly credible that any architect would permit tie-rods piercing small stones in this way.

The late Mr Edmund Street (the gifted architect of the present nave of Bristol Cathedral) took considerable interest in Dundry Tower during the early 'seventies.

Weston-super-Mare. EDWARD VALE.

The Cowley Family.

SIR,—I am desirous of expressing to you and to one of your readers, Mr. Dudley Harbron, F.R.I.B.A., of Hull, my thanks; to you for the insertion of my letter in your journal of the 7th inst. on the above pedigree, and to this gentleman for information sent to me direct.

I have thus been able to ascertain the descent of Walter Cowley, of London, from his ancestor John. I do not know if the matter of a date is of interest to some; but in the *Gentleman's Magazine*, Thomas Cowley, of Donington (founder of the schools named after him) is stated to have died in 1718. This is incorrect, for the date taken from the burial certificate in the church register is 1721. This, too, is the date on the memorial slab in the aisle floor of Donington Parish Church. Having thus, by the aid of *The Builder*, found willing helpers in establishing the descent of Walter Cowley, of London, from the Staffordshire ancestors, I am hoping other kind friends may be able to give us some links to connect Thomas Cowley, of Donington, with the above Walter, of London. One of Thomas Cowley's trustees was a Luke Cowley, of Crowland, possibly a younger brother. Thomas died in 1721, and Luke in 1730. By reference to church tablets or registers this may help to connect them, especially if the arms are displayed; and any help will be much welcomed

EDWARD A. JOLLYE, A.R.I.B.A.

Saturday Half-Holiday.

SIR,—Where, when, and why was the Saturday half-holiday established in the building trade? I have never heard the matter discussed. All concerned seemed to take it legally or religiously. I can understand observance of the Day of Rest for an indefinite period, but that Saturday half-holiday baffles me.

I know plenty of operatives in the building trade who think nothing of having a month's holiday in the summer-time, and even more in the winter-time; yet, if it were suggested to them that they should abandon observance of Saturday half-holiday, almost without exception they would regard that suggestion as equivalent to a proposed reduction in the rate of wages. But, even so, it does not follow as night the day that nothing else would eventuate to compensate and make the means of livelihood a little more interesting and a little more in accord with the laws of Nature. In fact, more than once I have silently gazed on some building estate at a standstill at mid-day Saturday, and destined to remain at a standstill till the following Monday, 7 a.m. In short, Saturday half-holiday, apart from the Day of Rest, seems to me perfectly meaningless. ARTHUR GEE.

THE CLERGY AND ART.

BY "A CRAFTSMAN."

WE are hearing just now a good deal of discussion on "spiritual healing" and how far these more mystical aids may come to the help of therapeutics in overcoming sickness and disease; but of the kind of spiritual healing with which beauty revealing itself through a nation can endow us we find but little, if any, recognition. And yet we might, from the amount of discussion and organisation directed to the promotion of art, expect that this was not the case, if we believed that such promoted it, which some of us do not. We are not conscious of our body when well, and art, when it functions properly and takes its place as industry well directed, needs but little fostering, happening, as the best things do, out of the virtues and life of the people. The fact, therefore, of so much organisation to-day should not too much reassure us, because it is all evidence that we need the physician, and we do not when well.

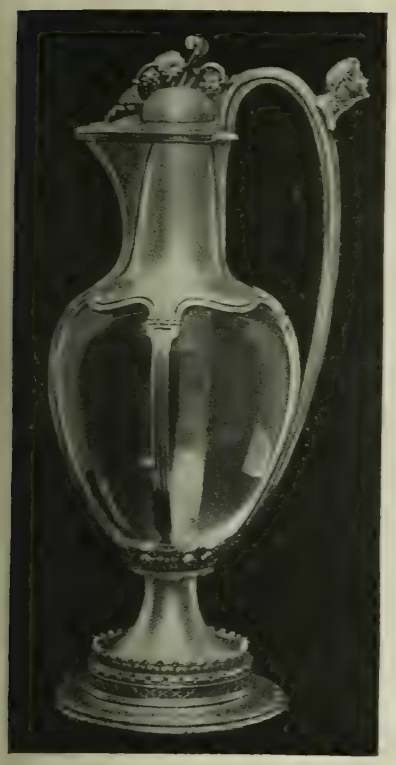
It would be unjust, however, not to perceive that this is becoming more recognised, and that the importance of beauty to religion, to health and to morality, and to a more ameliorating interpretation of life, is entering into our thoughts; and the view that art was a luxury which only the fortunate could afford, or that even money could alone secure it for us, in the light of the fact that the nations at the time of its highest development were relatively poor, is much discredited. The clergy, inheriting so long a tradition, are perhaps too readily inclined to think that an ecclesiastical appearance, some likeness to past work, satisfies the needs of beauty, and that to be imitative in this sense established its claim to be traditional. Unfortunately, such a view leaves out the major part of tradition. It has not always appeared to them that it is possible in a very narrow sense to be all this without much aid from art at all, because beauty is a creative thing, for which learning and orthodoxy are not sufficiently adequate equipment in themselves, though we are not at enmity with either. But in such a case revelation may have ceased altogether, and what we have to seek again for the church is that contribution of art which is creative and which, in becoming so, will give life to tradition once more.

The clergy have been too much accustomed to look for art of one pattern, and to order it from the catalogue, to consider enough what they are really seeking. In the deepest sense of it, to judge of men is to judge of art; and we must not depend on our own recipe for virtue, and should look beyond outward and inherited semblance and the conformities of the catalogue if we are to judge of it. Our standards are too much concerned with the use and want of custom, which has built up a large manufacture of art products, the result of industrialism and its commercial ideals. Beauty has little to do with this, and our minds have to become freed of habit and the customary for its influence to become greater. Industrialism has woven such an organisation around us that it is very difficult to penetrate beyond it to where beauty dwells in the heart of the artist, and our outlook is largely wrong.

To instance a case. A memorial window is required for the church, and it will not be unusual for the incumbent to ask for estimates and designs from half a dozen people; and perhaps, if well advised, there will be an artist among them, not working on competitive commercial lines, who will very likely not have been told that others are competing. The design chosen is the one showing the lowest estimate or that one which is most conformable to the expected, *i.e.*, the design which is "-exclusive" and made from the old material of the eminent Sir Blank Dash, R.A., who died from twenty to thirty years ago. But it is more like that to which we have become accustomed, while the artist's—who has created his design—is not, and therefore asks much more from us. And then, as finale to it all, this artist asks to be paid a small fee for his design, to the consternation of the incumbent, for the other competitors submitted their designs without charge for them. Cannot the clergy interpret the inference of this without our labouring it here?

The clergy need the training which shall enable them to recognise authentic beauty from the substitute, and to reject plausible and the imitative and standards of a commercial approach, this is essential to the prospects of n vital art. In such circumstances timi will not help us to a more exalted living tradition. We need to decentra art from all this, and seek it independe in the individual, from the artist, get through to him at first hand.

The clergy are shy of the artist, bec they are not sure, and do not underst his orthodoxy, through which his titl artist is sustained, and consequently often in the wrong place in an easy acc ance of bad conditions. But in saying we do not fail to recognise that there exceptions, and that credit is due to efforts made by some among the clerg the face of many difficulties.



In looking for the remedy we must rely too much on organisation. We ca raise ourselves above our own sta merely by numbers. Committees, exper committees of taste—are often but to m "art tongue-tied by authority"—bec they are only expedients, whereas we n for security the illumination of our minds—to be something ourselves. In end the church has the art it deserves, the better appreciation by the clergy of nature of art is a greater security trusting to experts and committees. Ha is the art which has but little governm and which emerges as the rightly dire activity of the race. For by the tim committee has sat long enough, will play for safety, and there no safety in the finest adventures of or life. But it is better to risk defeat t to risk nothing, and the best hope for lies less through the accredited ways channels than through our own enligh ment as to where it should be found.

It is not unusual to hear the state that craftsmanship in the old meanin the term is dead. It is often the case while we are deploring the loss of a t in one direction it is appearing thro another. Craftsmanship in the old s has little application to mass product with its minutely divided processes, were this the only direction for pers craftsmanship we might accept the los a fact. But there has grown through development of a more applied craft-t ing a considerable expansion of the s industry in recent years, and we are at the beginning of this development w includes within it a change in hu objects, from those of rivalry in compet to a more corporate aim. We do not to exaggerate the consequences of this direction, nor, because believing in little leaven, disregard the many diffic in the way. But it is the case that small workshop, the local industry, is r fying the situation, and, far from c manship being dead, it is very much and extending its hold. Instead of cre new wants, exploiting the weakness dulgence of the community, it is cre new worth and co-operating in the ends of art, which are the amelioratio satisfaction of life. It is when regard these issues that the gravity, in neglect to foster the real ends of be comes home to us, and the responsibil the clergy becomes so great. For art out of life, not out of former art or dent; nor can our knowledge of past and schools create it for us.

At the Church Congress Exhibition.

A'abaster Panel representing a Visit of the Magi (said to be 13th century work), from Treslotham, Cornwall.

Claret Jug presented to H.R.H. The Duke of York by the Royal Academy.

THE CHURCH CONGRESS EXHIBITION

The Bishop of Exeter on Saturday afternoon st opened the Church Congress Exhibition and an Collection, held in Millbay Drill Hall, Plyouth. The exhibition, the fortieth of its kind, probably one of the most remarkable in the story of the Congress. A feature of the loan llection is that the bulk of the exhibits have en drawn from the two counties of Devon and rnwall.

The Mayor of Plymouth (Councillor S. phens) officially welcomed the Congress. Mr. H. W. Hill, Director of the Exhibition, d the exhibition showed that even in these dern days the old crafts were not yet dead. The Exhibition remains open until this ning (September 28).

The Royal exhibits include the addresses of come, lent by the Prince of Wales, which e presented to H.R.H. at Bradford, Birgham, Bath, Leeds, Liverpool, Nottingham, chester and Manchester. H.R.H. the Duke ork has lent the claret jug presented to him members of the Royal Academy on the occaof his marriage. The jug, which is entirely d wrought of sterling silver and crystal glass, very great interest. The lid is surmounted cresting of forged vine leaves and tendrils. handle bears a miniature bust of Dionysus, god of wine. The actual mountings of the s are made after the manner of a "spider net," so that in case of breakage a new can easily be inserted. The foot, which s the dedicatory inscription, is fashioned in motely castellated manner, as a symbolic ence to the fortified dignity of Royal e. It was designed and made by Mr. r Ramsden.

Devon and Cornwall are rich in ancient h plate, and some exquisite specimens are iew. What is probably the oldest paro- chalice in use in England is lent by the r and churchwardens of Ashprington, es. It is a fine example of thirteenthry work and the date assigned to it is It is just under 6 in. in height. It has mispherical bowl with the addition of a lid 4¼ in. in diameter and about 2½ in. deep. The stem is octagonal, with large rounded boss or knob, and a circular foot, outward spreading, with plain vertical edge.

The chalice (date 1628-9) lent by the vicar and churchwardens of Dawlish is of interest from the fact that it is a replica of the chalice from which King Charles received his last Communion, and is by the same maker.

The only example yet known of a chalice by an Exeter goldsmith, named Richard Osborne, who was working at Exeter from 1562 to his death in 1607, is lent by the rector and churchwardens of Cadleigh, Tiverton. It may be dated as *c*1572.

A chalice and paten, dated 1575, made for Duloe Church, Cornwall, is lent by the rector and churchwardens of that parish.

Some pieces of pre-Reformation plate, a chalice and paten, come from St. Mary's Bradoc, Lostwithiel, lent by the rector and churchwardens, but it bears signs of modern "restoration." From the same source comes an Elizabethan chalice and cover paten, dated 1576.

Many points of interest are to be noted in the communion cup, dated 1650, lent by the rector and churchwardens of St. Tudy, Cornwall. It bears the annual date letter of the London Assay Office for the year 1650. The cup is of the peculiar type which was introduced about 1640 and continued until 1660. The most marked characteristic of the cup is the adoption of a stem of the baluster form. There are supposed to be only two others like it in the Kingdom.

The communion cup with cover, lent by the rector and churchwardens of St. Petrock's, Exeter, is dated 1572. Seven complete figures of saints are worked on the material with silk and gold thread. It is possible to recognise St. John Baptist, St. Dorothea, St. Paul, and Edward the Confessor.

The Wraxall chalice, lent by the rector and churchwardens of the parish, is quite unlike any other in Dorset or Wilts. The bowl is straight-sided and tub-shaped; the stem tapers from the base almost to a point. It bears a maker's mark which resembles one found on plate made between 1615 and 1629, which may perhaps be the date of the cup, or it may be later in the seventeenth century.

Of Bibles, manuscripts, &c., there are many examples, including a quarto Bible and Prayer-Book dated 1575; also a quarto Bible and Prayer-Book, dated 1730, with office of "At the Healing." More interesting still is the copy of "The Four Gospels," by Andrew Jukes, 1864. It has General Gordon's signature in pencil and many passages marked by him.

An autograph letter of Sir Walter Raleigh (1584) and the "seal" of Joanna Southcott, discovered in an old house in Exeter, are shown by the courtesy of the Royal Albert Memorial Museum, Exeter.

The great missionary, Henry Martyn will always have an interest for West Country folk, and in the exhibition will be found a view of a house at Shiraz, where he stayed in 1811. A view of Martyn's grave at Tokat is also shown.

Among the manuscripts lent by the Proprietary Library of Plymouth is one entitled "A Cat may look at a King," by Sir A. Welding (1652). It is believed that this MS. is unpublished. It contains the characters of the English sovereigns to Charles I.

A pathetic interest attaches to the hearse cloth or funeral pall presented to Westminster Abbey by the Actors' Church Union in memory of members of the theatrical profession who fell in the war, and lent by the Dean and Chapter. It was first used at the interment of the Unknown Warrior in the Abbey on November 11, 1920. Designed by Mr. W. D. Caroe, F.S.A., and executed by Miss M. Hollier, the pall follows the model of certain mediæval specimens preserved by various City Companies. The groundwork is of white brocade, powdered with the Tudor rose and portcullis badges.

The exhibits also include Charters lent by the Mayor and Corporation of Plymouth; the white Plymouth china sphinx; the alms box from the south wall of Pinhoe Church, known as "The Poor Man of Pinhoe"; the Ducking Stool (1656-7) which was in use at the Barbican, Plymouth, as a punishment for "scolds," as recently as 1806; the thirteenth-century alabaster panel, representing the Visit of the Magi; a large number of crosses, including the Siege Cross of Ladysmith made by soldiers from a Boer shell fuse; the Ascoti Cope; the deck cannon from the Spanish Armada, the ramrod of which was broken in the gun, so that the vessel blew up in the act of charging; the last club used in war by Thinkambo, the last King of Fiji; a touch piece of Charles II presented by the King to persons whom he touched for the King's Evil.

The Builder model of Old St. Paul's is also on view.

£150 Housing Subsidy.

Pontardawe (Glam) R.D.C. has decided to add £50 from the local rates to the £100, the capitalised grant permissible under new Housing Act, making an advance of £150 per house erected by private enterprise.

At the Church Congress Exhibition.

The St. Petroc's Casket (said to be 12th-century work), from Bodmin.

THE ANCIENT CHURCH OF COPFORD IN ESSEX.

BY W. DE GRAY BIRCH.

VERY few churches in the county of Essex possess so many features of interest from an archæological point of view as that of Copford. The village and small parish takes its name as being the site of a ford over the "Roman River," so-called, which, rising in the adjacent neighbourhood of Mark's Tey, runs in a south-westerly direction towards Abberton, and falls into the River Colne at Wivenhoe and Rowhedge. The church lies about a mile and a half from the junction of the Great Eastern Railway at Mark's Tey and about five miles to the south-west of the great town of Colchester. This ancient building of early Norman date—of which I am enabled, by the kindness of the Rev. Edmund R. Ruck-Keene, rector, to reproduce four photographic illustrations of much attraction to antiquaries and architectural students—is dedicated to St. Michael the Archangel and All Angels, It possesses an arcaded nave with fine arches of early Norman style, chancel with round-headed arch of large radius, nave with curiously arched roof, and remnants of arches on each side which suggest, from the reduced radius of their segment, that they met in the centre of the nave by a kind of pendentive arrangement, a south aisle, a south porch carrying a small wooden turret at the west end, in which are three bells, covered with a shingled spire, and a very remarkable semi-circular apse at the east end. This apse and the nave are probably the oldest features of the building and belong to an early Norman design—if, indeed, they are not the creation of a Saxon architect whose career extended into the closing years of the eleventh century. The aisle is an addition of about the end of the fourteenth century. This aisle was cut through the south wall of the original church, and in course of the work the original windows had their lower parts destroyed, but their arched heads are still visible in the view (Fig. 2) on the right. They were filled in with rubble when the alterations took place. The old Norman buttresses of the south wall of the church constitute the pillars separating this aisle from the nave. About 1690 the church was "restored" by the parishioners, and upon scraping the inside walls, with a view to giving them a coating of whitewash, "there appeared," as is stated in Wright's "History of Essex," "very fair and fresh paintings of Christ upon the Cross, the mother-in-law of the apostle Peter lying sick of a fever (error for the centurion appealing to Christ), Mary Magdalene, &c., which were all whited over again, but not otherwise injured." This statement led to the scraping off of the whitewash in 1872 from the interior of the apse, and the interesting paintings as now seen were brought to light, and unfortunately "recoloured" by a Mr. Daniel Bell "exactly as he found them." But none of those mentioned by Wright were among those then uncovered. In 1880 the body of the church was "thoroughly restored," when the entire surface of the Norman walls was found to be covered with very beautifully designed and drawn early mural paintings, evidently those referred to by Wright, constituting a veritable and comprehensive *Biblia Pauperum*, as it is called, a series of Biblical pictures adapted to the simple understanding of the peasant votary of the "unlettered muse," whose limited education did not go so far as to enable him to read the Scriptures. These quaint pictorial efforts of an early mediæval artist, we are told, have not been marred by repainting but remain in their pristine condition. The pose of the figures, the drapery and accessories, are elegantly drawn and bear close comparison with similar drawings contained in illuminated manuscripts of English origin as old as the twelfth and thirteenth centuries.

With respect to the fabric of the church, some antiquaries conjecture that the walls form part of a building erected by the Romans during their occupation of Britain, others give the early Norman times to its foundation. It is at any rate, very rich in Roman materials. The quoins of the buttresses consist, for the most part, of Roman tiles, and a course of these passes round the whole (see Figs. 1 and 4). Some very fine specimens of these tiles are visible, especially one by the north door, with the large dimensions of 22 by 18 ins. Were this church built by the Romans it would probably have been a temple, afterwards converted into a Christian church, but no record exists to confirm this view. The principal point of interest is the circular apse, carrying very beautifully proportioned windows with round-headed arches not provided with voussoirs, but having slender columns at the sides, and set high up between massive buttresses (see Fig. 4) which are carried up to the top of the wall. The work here shows extensive employment of Roman tiles and bricks, no doubt obtained, as was the case at St. Alban's Abbey Church and many other buildings, from some Roman edifice not far off. In contrast to this antiquarian charm is the lavish display of mural decoration which detracts, as at Ely Cathedral, from the appreciation of the archaic *ensemble*. Passing from the chancel and noting the wide overhanging eaves of the apse, and proceeding along the north side, one observes a narrow doorway, now blocked up, of the kind said to have been in use for the entry of the choir from the fifth to the twelfth century, but later reserved for the use of the priest only. This door was visable as late as the sixteenth century, for the unfortunate Bishop of London, Edmund Bonner, resided in the adjacent Copford

Hall," and his remains, which were discovered in 1809 by John Kelly (then rector), still lie buried beneath the altar.

A few steps take us to the adjoining buttress in the church wall, which has a peculiar division in its heading, showing that it originally led through a doorway into the roof of the church. The north door, with circular arch, is curious, for the door itself was at first the south door of the church, and on it, as related by Newcourt (who is somewhat sceptical about the story), were found remains of a human skin, said to be that of a Dane who was captured in a field, still called "Dane's Field," and as a punishment for sacrilege flayed alive and his skin nailed on the door, small portions of which are still visible under the massive ironwork on the door, and other pieces of it are preserved in the vestry and in the Colchester Museum. The wall of the west end is considerably out of plumb; this was probably caused by its being overweighted by the tower, a fourteenth-century erection, with slight Norman buttresses, insufficiently strong to carry the additional weight resting on them. These buttresses had, indeed, been strengthened at an early date by rude masses of brickwork, now replaced by those of an Early English style of architecture. The church itself is lofty, having been at one early time, as stated in Holman's MSS. in the library of the Colchester Museum, all arched over, as appears by the vast thickness of its walls and existing remains of the vaulting work. Above the west window was a door, with holes on each side for lighting the interior of the old groined roof, where the priest had a private chamber or parvise furnished with a lavatory drain pipe. At the south-west corner an aisle was added (see Fig. 2) in the fourteenth century, formerly furnished with a porch, unhappily destroyed in the latter half of last century. Curiously enough, the pillars already described as separating this aisle from the nave, and consisting of the old buttresses of the original church, show the same method of use of Roman tiles in the quoins. The chancel screen belongs to the late fourteenth or early fifteenth century. The mural paintings are too numerous to be described in detail within the scope of this short notice. I can only say that the church deserves close investigation of its numerous details of ancient date, and being so close to London well deserves a pilgrimage which offers so many points to the notice of the student of ecclesiastical art, whether he be a novice or an advanced master in the science of ecclesiology.

The Architecture Club.

The next dinner of the Architecture Club has been fixed for Thursday, November 22, 1923.

EXHIBITION NOTES.

FRENCH ART AT THE LEICESTER GALLERIES.

It is doubtful whether the average lover of pictures in this country is attuned to the right point of appreciation of modern French art. The French painters obviously look at nature in a more or less different way from us and we always feel that there is possibly less sincerity and less self-abnegation amongst French painters than those of our own country. They have certainly taken up with avidity the lead into the bizarre and novel treatments which the last few years have seen developed, and it is not a little difficult to see why so many extraordinary pictures are painted, whilst we wonder if there exists any appreciable number of picture lovers who really like the outrageous stuff which has passed for pictures in the last ten or fifteen years. There are pictures in the collection of modern French work now open at the Leicester Galleries which are a pleasure to look upon, but there are a number which no amount of study or consideration can bring us the least atom of pleasure. It is not a little curious why it should be considered worth while to paint and draw the female nude in so coarse and disagreeable a way as to eliminate all the natural beauty or grace which the nude female is supposed to possess. Granted that these are graphic and true as studies, why should we be called upon to look at them in a public exhibition? There is certainly a fine nude study by Degas in the exhibition, but even at the loss of his masterly drawing we should be content to have remained in ignorance of many things he has done. It is curious to contrast the spirit which produced the beautiful "Moonrise," by Harpignies, the delicate Corot "Paysage d' Italie," or the later perfect picture of his making, "Le Coup de vert dans les dunes," with the terribly coarse and stupid work which is to be seen in the other gallery. What fine accomplishment there is in "Still Life," by Fantin Latour, and the "Dordrecht," by Boudin. And yet they hang in the same gallery, as things which in form or colour, in composition or sentiment, appear almost beyond the pale of civilisation. Our French neighbours are a nation of artists, but they have suffered as badly as any from the inroads of a restless groping endeavour after a new art.

ILLUSTRATIONS.

Prince Hall, Dartmoor, Devon.

These plans show the rebuilding of the above as a sports club for the west of England, the existing building being incorporated as a nucleus. Messrs. Richardson and Gill, FF.R.I.B.A., are the architects.

Houses, Hughtown, Isles of Scilly.

The accompanying plans, elevations, and detail show a fragment of the rebuilding schemes now in operation in the Isles of Scilly. The work is being carried out by the building department of the Duchy of Cornwall. Messrs. Richardson & Gill, FF.R.I.B.A., of London, are the architects.

Sketches in Devonshire.

The late J. D. Sedding used to say what a splendid place the west country was for "crib" as a refresher for the architect. It is certainly specially interesting for the wealth of quaintness and spontaneity of detail in the work of the old craftsmen. The telling effects of architectural form is shown in our Devonshire sketches this week. Probably none of them were evolved from the architects' plans as we know them to-day, yet how pleasing is the effect of soaring height in the buttressed tower above the little cottage at Stoke Fleming; what a sturdy breadth there is in the old farmhouse at Stokenham, and how pleasingly picturesque are the other subjects, all teaching something of natural and unaffected simplicity.

"Archerton," Postbridge, Devon.

This house was built originally in 1840; it then consisted of the ground floor and one story in the roof, which was of thatch. The house was destroyed by fire in 1916. The new building partly incorporates old stem walls which escaped damage, but the plan is quite different. The design is a free adaptation of the Regency style treated in a modern way. Messrs. Richardson & Gill, FF.R.I.B.A., are the architects and Mr. John Halfyard, of Princetown, the contractor.

St. Luke's Church, Maidenhead.

This chapel, which abuts against the north wall of the chancel, consists of three bays, and its construction involved the demolition of the original vestry. The roof of the chapel, which continues the line of the general aisle roof of the church, has oak purlins, wall plates, and principals. The open boarding is coloured blue, while the rafters are white, with stencilled patterns on their faces. It is intended to carry the colour down, with a coloured and gilt reredos, screens, and panelling, at a later date At present this object is effected by a rich stained-glass window made by Mr. A. K. Nicholson, of 105, Gower-street, representing in the centre light the Madonna and Child, with St. Luke and St. Martin in the side lights. Beneath this is a blue and gold dossal, the work of Miss Beckh, of 20, Thurloe-place. The altar is of fumedoak, and was made by Messrs. Bowman & Son, of Stamford. The floor covering is in light and dark green squares of Ruboleum, divided with black bands. The effect is quiet both in colour and sound. The chapel is lighted by three windows on the north, as well as the east window. These have simple tracery heads without cusps. The artificial lighting is obtained by linolites, which are fixed on the face of the rafters, immediately east of the principals, and is invisble except from directly beneath or from the east. Arches have been formed between the chapel and the chancel, giving interesting views from the nave, looking across the chancel. The chapel is to be consecrated by the Bishop of Buckingham on October 21. The general contractors were Messrs. J. K. Cooper & Sons, of Maidenhead and the architects are Messrs. Cheadle & Harding of 2, New Square, Lincoln's Inn, W.C. 2.

Window at Westminster Abbey.

[This window is by Messrs. James Powell & Sons (Whitefriars), Ltd., and was recently unveiled by H.R.H. the Prince of Wales. It is in memory of officers and men of the Queen's Westminsters who fell in the war.]

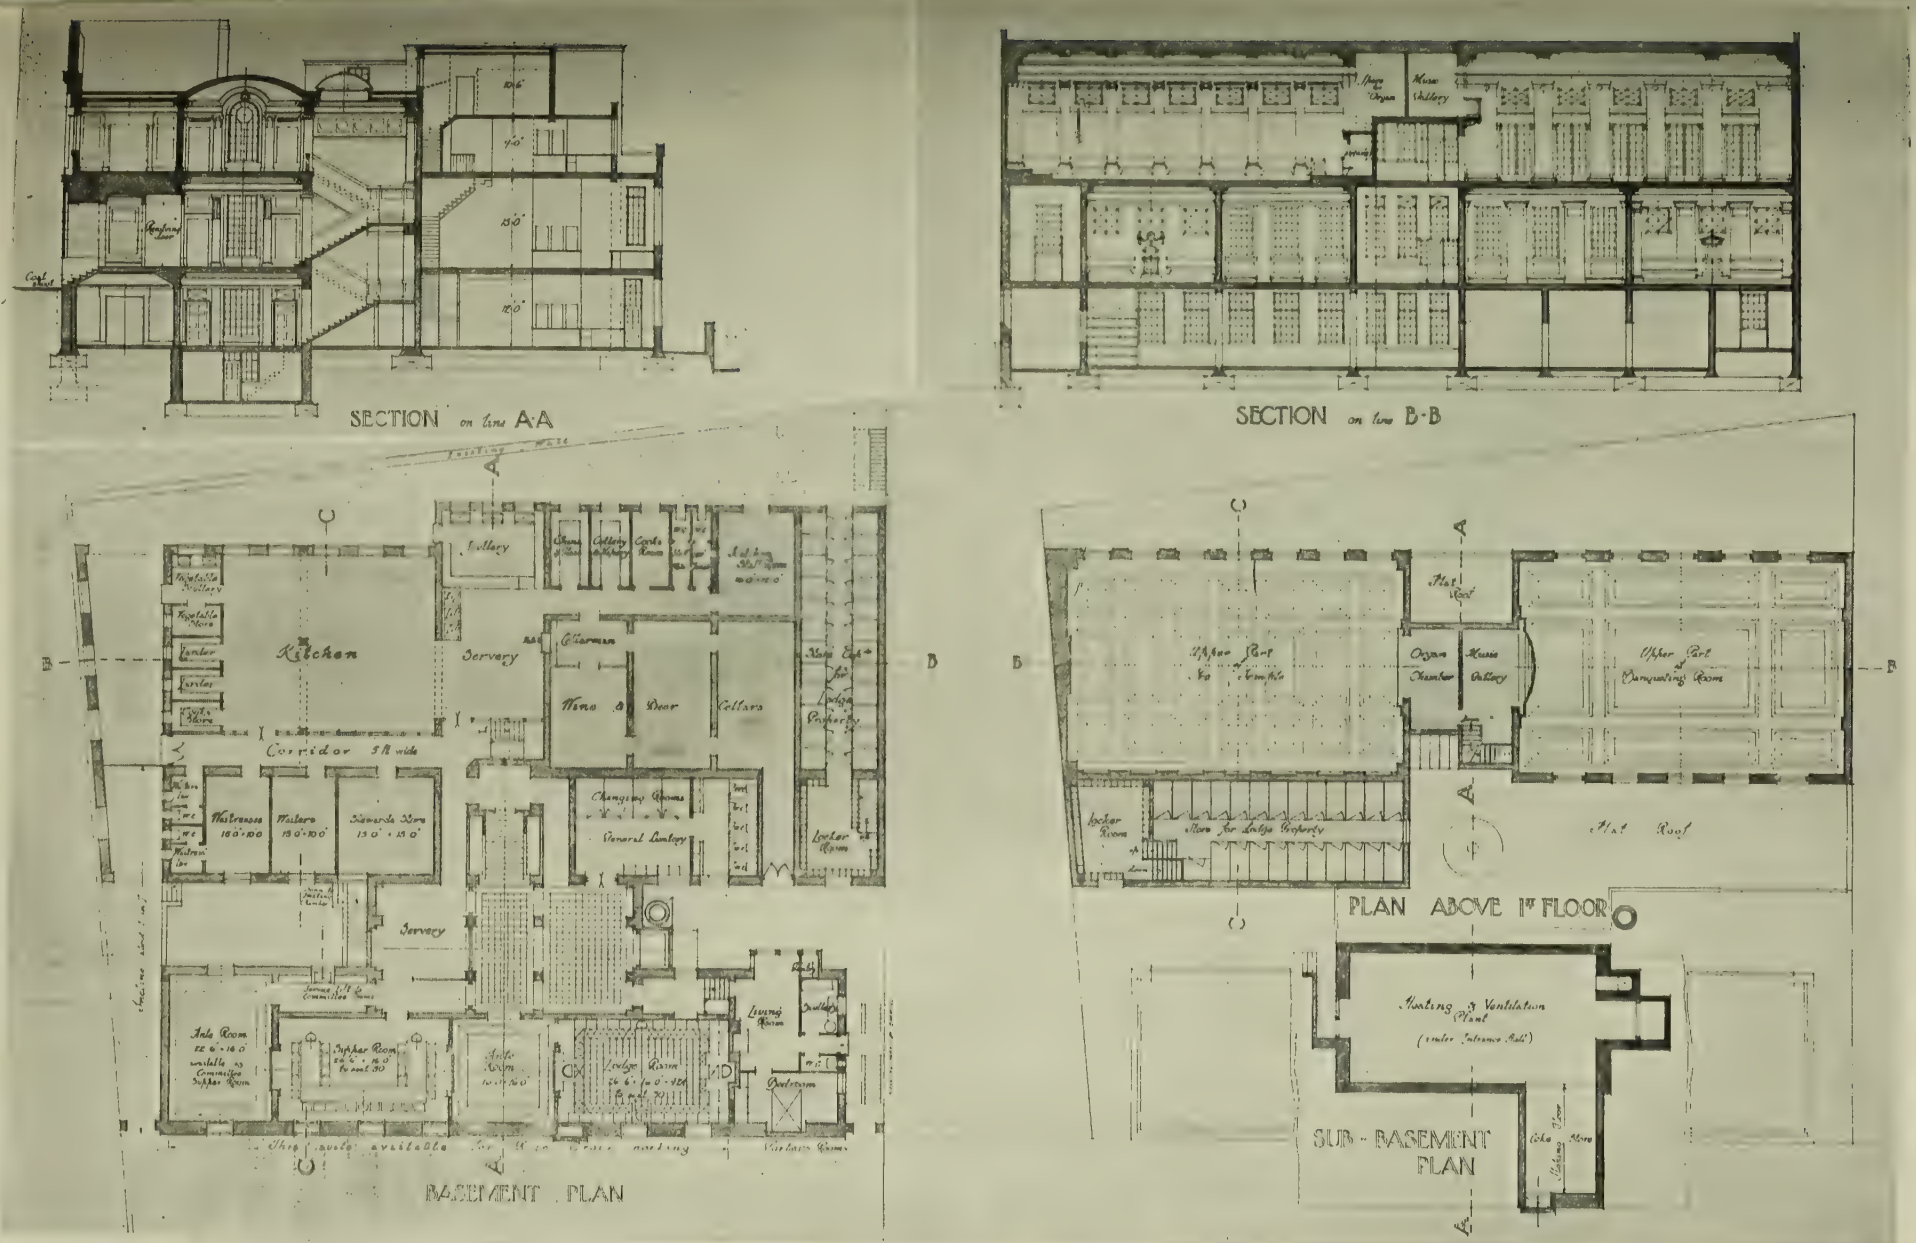
Porch of Plympton St. Mary's Church.

The porch of Plympton St. Mary's Church (three miles from Plymouth) is rather uncommon in its design, having two stories over the porch itself, and the walls are carried higher than the parapet of the side walls of main building. The church is of the Transitional period. The actual date of the building is uncertain, but it is evident that the porch was built in the latter part of the fifteenth century, as it shows some distinct features of Perpendicular work. The porch is a fine example of the well-proportioned though rude work which is so characteristic of Devonshire. The walls are executed with local granite in courses varying from 6 in. to 18 in. in depth and crowned with a battlemented parapet of the typical Perpendicular style 38 ft. high. It has two substantial and bold projecting buttresses with three moulded and weathered offsets in each and finished with a pinnacle (41 ft. 10 in. from the ground), which is also a typical feature of fifteenth century work. Just underneath the cornice there is a large canopied niche finely ornamented and crowned with a crocketed finial which contains a much-decayed figure representing the Almighty Father sustaining Our Lord on the Cross, whilst in the niche below is depicted the Annunciation. A sculptured figure of the Blessed Virgin Mary stands in one on the east and that of the Angel Gabriel in the one on the west side of the window. The doorway is a good specimen of Perpendicular work containing the typical carved spandril and a moulded jamb which is continued around the arch. The interior of the porch contains a holy water stoup, and three richly carved canopied niches over the inner doorway, and the ceiling is also richly groined with fan vaulting, with carved boss at junction of the ribs. The centre boss is larger than any of the others and has the Crucifixion depicted on it, and on the four sides of it are other smaller ones carved with figures of angels.

The drawing is by Mr. W. W. Hitchins.

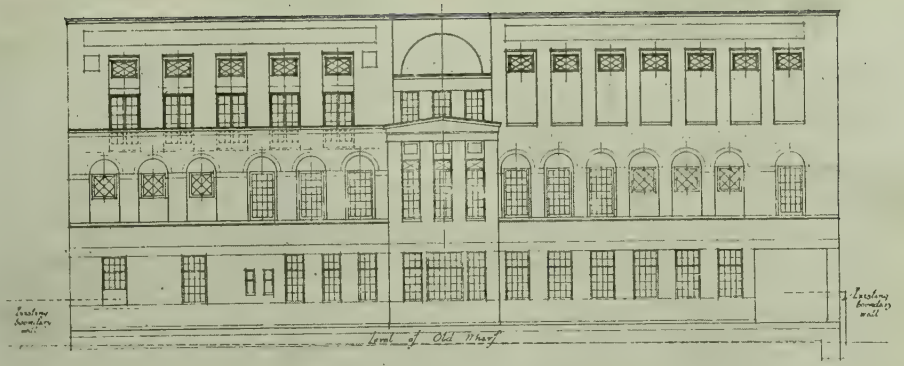
MEETINGS.

Wednesday, *October* 3.



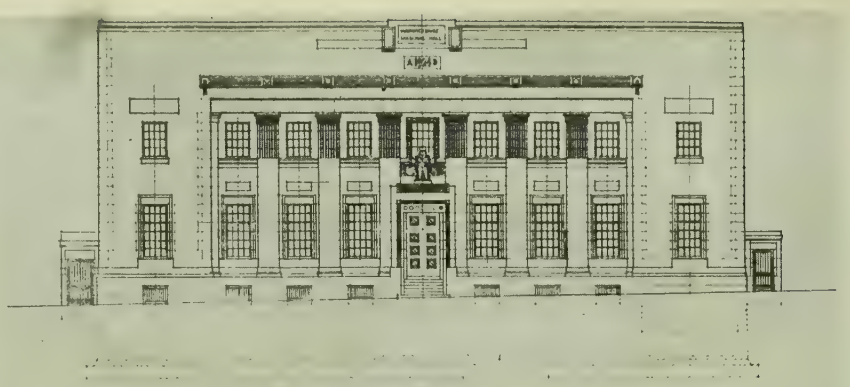
Institution of Sanitary Engineers.—Opening Meeting. At the Cabin Restaurant, Caxton House, Tothill-street, S.W. 1. 7.30 p.m.

L.C.C. Central School of Arts and Crafts.—Sir Banister Fletcher, F.R.I.B.A., on "History of Architecture: Introductory Survey." Southampton-row, W.C. 1. 6 p.m.



Essex Archæological Society.

The Essex Archæological Society visited St. Osyth Priory by permission of Brigadier-General K. Kincaid-Smith, K.C.B., for the September excursion. The Priory, which is a few miles from Clacton-on-Sea, was founded early in the twelfth century by Richard de Belmeis, Bishop of London, who established there a priory for Austen Canons on the supposed site of a nunnery founded by St. Osyth, daughter of Frithwald, King of East Anglia. The great gatehouse, built late in the fifteenth century is one of the finest examples of its class in the country. The clock tower and the beautiful oriel window were built about 1527 by Abbot Vyntner. In 1553 Lord Darcy converted the buildings into a house and Queen Elizabeth twice visited the Priory as his guest. Some years ago many parts of the ancient building were restored.



The party also inspected St. Osyth Church, dating from the twelfth and thirteenth centuries, and passed on to the neighbouring town of Brightlingsea. The church of Brightlingsea was built in the thirteenth century, and the lofty west tower was erected in the fifteenth century. The ancient house known as "Jacobs" in High-street, Brightlingsea, built in the fifteenth century, was also visited. The house has good timbered ceilings.

MASONIC TEMPLE COMPETITION, BIRMINGHAM.

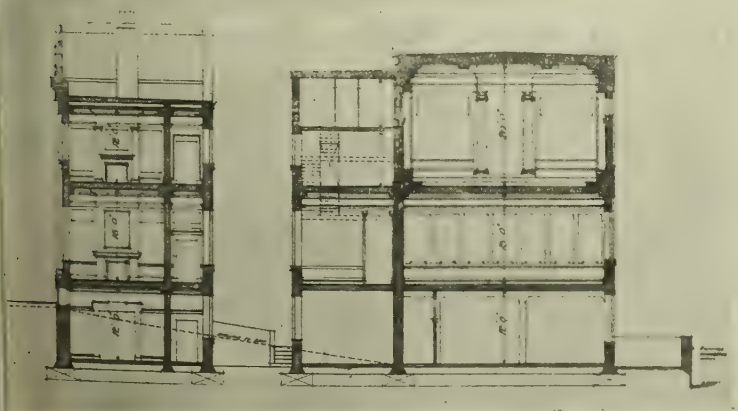
ive this week the design placed first in npetition by the Assessor, Sir Banister r, F.R.I.B.A., who, in his report, says :— author of design No. 3, to whom I he first premium of £500, has been most ul in fulfilling the conditions and re- nts, and has produced a straightforward ilfully arranged plan. The basement s the kitchen department with scullery, stores, staff room, wine and beer cellars side entrance) all conveniently placed ation to a central servery with lifts and stairs to the upper floors. This floor tains the quarters for the resident porter, ently placed at the western entrance of The general lavatory with the dressing for brethren are in proximity to the aircase. The lodge room to seat thirty, r with ante room and dining room, would careful ventilation. The author has y considered that the general lavatory the lodge room would be sufficient, but ample room for lavatories in the ante t the east end of the suite. A heating r is provided in the sub-basement. round floor has a central doorway and a s entrance hall with passenger lift and box, and with main staircase to the loor. Convenient to the hall are the ial Grand Secretary, Clerk and Steward, ion room and committee room well close to a service lift, and the masonic and library. The lodge room to seat nd the lodge room to seat fifty are both d with ante rooms, lavatories, rooms for te, ample locker rooms, and store cup- for lodge property. The dining rooms e two lodges are provided with an ample with lifts from the general servery in it.

irst floor contains an assembly hall with er lift, and three of the committee rooms service lift; also Provincial Grand and Provincial Grand Officers' robing A ladies' cloak room and lavatory is l, and, if necessary, could be con- y used in conjunction with the com- oom on ladies' nights. The lodge room 150 is of good proportions, with ante loaks, and lavatory, and with locker d store for lodge property in a mezzanine The banqueting room is of ample size, ly arranged with large servery having rs, and with lifts to kitchen servery in t. The author has not adopted the on that this banqueting room should be p with a smaller dining room, but has a crush room which would be capable ons of seating 70 additional persons.

The front elevation is extremely simple and distinctly original, somewhat reminiscent of an Egyptian pylon, with plainly treated wings, flat pilasters, and a dignified central entrance. It presents a very reposeful appearance, quite in harmony with the purpose of the building, and I feel confident that it would make an extremely satisfactory façade, of which Warwickshire Masons would have reason to be proud. The back elevation has been well handled and possesses considerable merit. I have read the report submitted with this design, and think the remarks with regard to the railway tunnel, heating, ventilating, &c., are well considered, and that the work could be carried out within a reasonable margin of the total of £72,371.

The author of design No. 5, to whom I award the second premium of £300, has sent in a symmetrical and well-arranged plan. The accommodatoin is provided on the ground, first, second and third floors, with a mezzanine over part of the ground floor, and there is a small basement. This design has many excellent points with two internal areas giving light to entrance and inner hall, and main staircase enclosing lift. The Provincial Grand Secretary is placed near the entrance adjacent to the clerk, with the general lavatory and dressing-room for brethren at the one end, and ladies' lavatory at the other end. The entrance hall, main staircase, and inner hall are all of ample size and well lit. The lodge rooms have ante rooms well arranged with respective dining rooms *en suite* on the same floor, all somewhat large and thereby adding to the cost of the building, as do also the connecting corridors. The lavatories for the lodge room to seat 150 are on a mezzanine, which is not such a convenient arrangement as when adjacent to the ante room. The serveries are well planned and of good size; they are connected by lift and stairs to the kitchen on the third floor, and could each be provided with two doorways into the dining rooms which they serve. The kitchen store-room accommodation could, however, be advantageously increased.

The elevation to Broad-street is effective and restrained, with a good rusticated basement supporting a range of free-standing Ionic columns and surmounted by a low attic, while the back elevation has been well handled and possesses considerable merit. The author's report deals satisfactorily with the question of cost, and in my opinion the building could be carried out with a reasonable margin of his total of £79,512.



The author of design No. 1, to whom I award the third premium of £200, has sent in a very compact plan, largely controlled by placing the lodge rooms diagonally alongside each other in pairs on the ground and first floors. The accommodation is provided on the basement, ground, first and partly on the second floor. The Provincial Grand Secretary, Clerk and Steward are conveniently placed by the entrance hall, and the main staircase is kept centrally, close to the front wall, and with two lifts gives easy access from the entrance to the upper floors. The lodge rooms are arranged *en suite* with their respective dining rooms, but the lodge rooms to seat 80 is the same size as the lodge room to seat 150, and is, therefore, too large. It could, of course, be easily reduced by throwing the western bay into an ante room and including the present ante room with the hall. The service room on the ground and first floors serves in each case two dining rooms, and being inadequate for the purpose, would require reconsideration. The ladies' lavatory is approached through a room marked "Members' Common Room or Ladies' Room," but this could easily be avoided by placing the common room, where it would be of greater service, on the second floor beyond the committee rooms over the dining room to seat 30, or in the place of the two committee rooms facing the front, and it would be easy to add two committee rooms over the dining room to seat 30. The kitchen department in the basement is ample and well arranged, and the wine distribution room is conveniently planned in connection with the servery and lifts. The elevation to Broad-street is a well-balanced and extremely satisfactory composition in the Renaissance manner, and dignity is obtained by the central Ionic portico carried through three stories which would give fine architectural character to the building. The report submitted gives a good statement as to the scheme, and I consider that the building could be carried out within a reasonable margin of the total cost of £74,163.

As I have already stated, many of the remaining designs show considerable merit, and the Temple Committee is to be congratulated on the response to their invitation for competitive designs. All of these have defects of some kind; some are too large and wasteful or extravagant in character, or in having improper lighting; others have bad service accommodation to the dining rooms, an inconvenient kitchen arrangement, improper linking up of lodge rooms with ante rooms and dining rooms, etc.

[The names of the authors of the premiated designs are given on p. 476.]

LEGAL SECTION.

NOTES ON CURRENT CASES.

Building Estates and Approaches.

THE recent case, Cory *v.* Davies (1923, 2 Ch. 95) illustrates the difficulties that may arise on building estates as to mutual rights of way. About the year 1857 the owner of a large freehold estate at Cardiff was developing it as a building estate. Part of the estate consisted of a rectangular piece of land bounded on the north by an occupation road, on the south by a public highway, the Newport-road, on the east by a street called East-grove, and on the west by another street, West-grove. This piece of ground was divided into three rectangular building plots fronting on the Newport-road, and extending back to the occupation road and three contemporaneous leases were granted of the three lots. The three lessees were connected or related, and the three leases were identical in form except as to the names and parcels. The leases were for 99 years. The lessee's covenants included one that within one year dwelling houses were to be erected on the land and boundary walls and fences, and the buildings, boundary walls, &c., were to be repaired and maintained. The leases demised all ways and easements, and did not except or reserve the same.

The plots thus conveyed were laid out as follows:—Seven houses were erected in all, forming a terrace fronting on Newport-road, and set back about 40 ft. from it, and in front the highway was shut off by a continuous wall. In this wall there were two sets of gates at each end of the terrace, forming an access to a drive which was made in front of the houses and which, being only 9 ft. in width, was only available for a carriage to enter at one gate and leave by the other, as there was no sweep in which to turn a carriage. This drive formed the only means of access to the front of the houses, none of which had a separate tradesmen's entrance. The only other access to the Newport-road was a narrow gate made in about the year 1869 by the occupier of the middle house for foot passengers. In October, 1920, the defendant had bought the house at the easternmost end of the terrace. This house had been assigned in July, 1878, by one of the original lessees to a Mr. Williams, and that assignment did not contain any reservation in favour of the assignor of the right to use that part of the drive which fronted the house assigned or of the right to use the eastern gates.

The defendant had locked the eastern gate, and prevented the other occupiers of houses in the terrace from using the drive and gates opposite his house, and the action was brought by the owners of all the other houses, claiming a declaration that they were entitled to a right of way over the drive and through the gates and an injunction restraining the defendant from locking the entrance gate opposite his house. The gates had never been locked, except that between 1896 and 1900 the gates at the east end had been locked, and in 1919 the gates at the western end had been locked, but this, as the Court found, had been done for the mutual convenience of the owners and occupiers of the houses to ensure greater privacy for whom keys had at all times been available.

Before turning to the judgment it may be mentioned that the plans on the original leases were only ground plans in bare outline, the houses then not having been erected, or the plots laid out, but the above facts were obtained from plans which came from the custody of the successors in business to the original lessor's architect and surveyor. The position, as pointed out by the Court, was a curious one, for if the defendant was entitled to lock the gates at his end of the terrace, the same would be the right of the owner of the house at the other end of the terrace, and the result would be that the owners of the intervening houses would be cut off from vehicular access to the Newport-road. These persons could not make any new access to that road for two reasons—first, because they were bound by their covenants to maintain and repair the boundary wall, and secondly, because even if they could make an entrance through that wall, there was no space to make it suitable as an approach for vehicles, and in these circumstances the Court intimated that common sense seemed to demand that the Court should, if possible, find some legal origin for the right openly enjoyed by the plaintiffs for so long a time.

The inferences drawn by the Court from the facts proved at the trial were that in 1856 the three lessees, having ascertained from the lessor that he was willing to let them have building leases of the three plots, verbally agreed amongst themselves that they would lay out the plots as a terrace in the manner described, and after having obtained the lessor's approval to such laying out would procure the lessor to grant them building leases in accordance with their plans and specifications. The Court also inferred that the boundary wall and the gates were commenced to be built before the leases were actually granted, and that the three lessees shared the expense of erecting the front wall and the gates. The right had been enjoyed for over sixty years, but, as the Court laid it down, "It is well settled that a lessee cannot acquire a right of way over the land of another lessee under the same lessor either by prescription at common law, nor under the doctrine of a lost grant, nor by prescription under the Prescription Act, 1832 (Wheaton *v.* Maple & Co., 1893, 3 Ch. 48; Kilgour *v.* Gaddes, 1904, 1 K.B. 457)."

The Court, however, then held that the circumstances of the present case were such that, in order to give effect to the common intention of the parties, the law would imply the appropriate grants and reservations in the three contemporaneous leases, and this common intention would be given complete effect to if there were implied in the lease of each plot a grant to the lessee of the right during the term to use the drive and entrance gates and a reservation to the lessor and to his lessees as owner and occupiers of the houses erected on the other two plots of the right to use the drive and entrance gates so far as such drive and gates were erected on the demised plot.

The power to make this implication was derived by the Court from the judgment in Pwllbach Colliery Company *v.* Woodman (1915, A.C. 634), as the Court held that this case came within the second of two classes of cases dealt with in that judgment where easements may impliedly be created, and where it was stated that this class of case does not depend upon the terms of the grant itself, but on the circumstances under which the grant was made and that the Court will readily imply the grant or reservation of such easements as may be necessary to give effect to the common intention of the parties to the grant with reference to the manner or purpose in and for which the land granted or some land retained by the grantor is to be used, provided, however, that it is an essential condition of the implied creation of such easements that the parties should intend that the subject of the grant or the land retained by the grantor should be used in some definite and particular manner and that it is not enough that the use intended by the parties might or might not involve that definite and particular use.

The Court held that neither the absence of a reservation in favour of the lessor nor the fact that the leases contained some particular reservations in favour of the lessor prevented the grants and reservations being implied, and the case formed an exception to the general rule laid down in Wheeldon *v.* Burrows (12 Ch. 31). That general rule is that if a grantor inte reserve any right over the tenement gr it is his duty to reserve it expressly in the In this case, however, the Court held the leases were really parts of one transactio the easements were only required for the ficial enjoyment by the lessees of the three The lessor in granting the three leases cont covenants to lay out the three plots in the of a terrace was only giving effect to the ar ment made between the three lessees therefore, this was not a case where the or anybody deriving title under him by of a subsequent grant was claiming the b of an implied reservation in favour o lessor for his own benefit, and in these ci stances the Court should not allow the g rule to stand in the way of implying the a priate grants and reservations, to give eff the common intention of the parties to the

It will be remembered that the case, Han *v.* Jago (1921, 1 Ch. 322), which we not *The Builder* Legal Section, April 29, has application to this point as to imply grant of right of way, and that case was upon amongst others by the Court. It argued that, as the lessor was no party t arrangement made between the lessees grant by him or reservation in his favour be implied, but the Court as to this point that the lessor, by approving the plans specifications and by making the lessees cov to erect the wall and entrance gates acc to such plans and obliging them to ma them, had made himself a party to such ar ment. But the learned Judge, in case held that the Court had not the power to hol the necessary grants and reservations cou implied, dealt with the case from another of view. He held that the several lessees the same lessor had power as between them by express grant to create such ease limited to the duration of the term o lease and that, although the grants wer under seal, there was part performance t the case out of the Statute of Frauds.

Two other points were dealt with: that the defendant had bought the without notice of the existence of an ease and, therefore, he could not be boun implied reservation or by a verbal agre between the original lessees. The answ this, the Court said, was that the nature premises should have put him on inqui to the existence of any easements. O point we may refer our readers to the Yandle & Sons *v.* Sutton (*The Builder*, Se ber 29, 1922), where this question was disc The last point was that, as against some plaintiffs who were executors of the assigning to the defendant's predecessor i no reservation was made in the assign and any claim by the executors to the would be a derogation from the assign but this was also decided in the plai favour, for reasons we need not detail.

This case is technical, but highly instru as it shows the pitfalls to be avoided by accepting leases on a building estate entering into common arrangements. reservations and grants should be contai the deeds and then all such questions w avoided.

Before parting with this case, we may r our readers of another case which we no our Legal Section, November 24, 1922, Att General v. Hodgson. There a house had erected fronting a public park, and a b of the Corporation prohibiting motor had resulted in one means of access to the by this kind of traffic being cut off.

Workmen's Compensation: Onus of Pr

A recent decision of the House of Lo the case, Moore & Co. *v.* Barkey (*Weekly* July 28) is of importance, as it bears o question of onus of proof under the Work

ensation Act. The claim was for com-tion by the dependants of Barkey, who been employed in the appellant's colliery. uly 17, 1921, Barkey had gone down the ith a night shift foreman named Gillespie sist in clearing gas away. Gillespie had nnie oil safety lamp which discloses the nce of gas by burning low or going out, t Barkey had an electric lamp. By the Mines Act, 1911, section 34, subs. (1) iii, afety lamp shall not be unlocked except appointed lamp station. . . . by a competent person appointed in writing by the manager for the purpose, nor except in the case of electric hand lamps shall it be relighted except by such a person." Both men were killed by an explosion, and on exploring the scene of the explosion the Glennie lamp was found to be unscrewed and a box of matches was found between the two parts of the lamp.

The arbitrator found that the explosion was due to an attempt to relight the Glennie lamp in breach of the regulation. Gillespie had the control of the lamp but the two men were working together, and on these findings he refused compensation. The Second Division of the Scotch Court of Session had reversed this finding and the House of Lords affirmed this decision, on the ground that the arbitrator was wrong in placing the onus on the claimants, for there was a strong presumption that the accident arose out of the employment of the deceased man, and the onus lay upon the employers to prove that the deceased had added a peril to his employment in contravention of a statutory regulation.

Memorial Window for a House at Purley. Designed by Mr. Reginald Hallward.

[his window, of which the central three lights only are shown in the ograph, the whole being composed of five lights, was executed he staircase of a private house. The figures are silhouetted on a r-white plain glazing and are without background, surrounded by der of varying tints of blue and green. The central figure represents ving Kindness," holding a basket full of varied flowers—the strongest of colour—and giving gifts to the children. The centre top-light contains the dedication, with little angels playing instruments on either side. In addition to the metallic oxides, enamel colours are used in the painting of the glass, such as the embroidered patterns on the dress, &c. The plain glazing surrounding the figure portions and to which the two outside lights are limited, contain quarries scattered through them with floral patterns. The whole window is an excellent example of modern craftsmanship.]

HEATING, LIGHTING, AND VENTILATING

ELECTRICAL INSTALLATIONS.

THE ARCHITECT AND THE BUILDER.

By "M.I.E.E."

In the electrical equipment of homes, factories, shops—whatever it may be—there are four parties concerned: the architect, the builder, the electrician, and the owner. Obviously, the last named, who has to foot the bill, would be the gainer if the other three could work together with a view to keeping down the cost of the work; but in how many cases do we find effective co-operation between even two of the three? Only in the case of large and important buildings, in which the adoption of electricity for lighting and power is a matter of course, do we find provision made, more or less efficiently, for the execution of the electrical work at the proper time and in the best way—or, in recent times, when a local authority decides to provide for the use of electricity in a housing scheme. Yet the fact that for illumination electricity is nowadays without a rival, and that its use is rapidly extending for cooking, for occasional heating in dwellings, offices and shops, and for an infinite variety of other purposes, cannot be ignored. Nevertheless, it is common practice still to design and erect houses and other buildings and to finish them ready for occupation before the installation of electrical equipment is so much as considered. Usually they are piped for gas and water, apparently because from time immemorial it has been customary to make such provision; but the times have changed, and modern needs should be met in modern buildings from the first.

The owner depends upon the architect to advise him and to adopt the most up-to-date practice; the builder must act upon the instructions of the architect, and the electrician comes in a bad third, to make good the omissions of his predecessors on the job, and to overcome the difficulties with which he is confronted as best he can. It is to the architect, therefore, that the appeal must be addressed, for he should give the subject his close consideration.

Dealing first with illumination, it would be too much to expect the architect to be an "illuminating engineer" and to devise a complete scheme in detail for this purpose; but he is compelled to deal with the matter in respect of daylight, at least, and as he is solely responsible for that class of illumination, he must necessarily be familiar with the broad principles by which it is governed. Since he is charged with the design of a building which shall be habitable and suitable for its purpose, surely he ought to take into account not only the daylight hours, but also those during which artificial illumination will be necessary and make the proper provision for it in the first instance. The mode of illumination—direct, semi-indirect, diffused or concentrated—and the quantity of light required, measured in lumens, for average conditions should fall within his purview, and in a building which has claims to architectural beauties he should specify and approve the design of the fittings. By providing ducts for the wiring in the walls and ceilings he can go farther and fix the exact positions of the lamps; but in important cases of this class the collaboration of a trained illuminating engineer is almost indispensable. On no account should such matters be left to the discretion of the contractor.

But to equip a building only for electric lighting is a mistake. The innumerable benefits derived from a supply of electricity render it desirable that ample provision should be made in the first instance for their enjoyment. The applications that we have in mind fall into two classes: those in which the electrical apparatus is permanently fixed, and those which involve the use of movable appliances. Under the former head are included electric lifts, cookers, water heaters, &c., all of which call for specially heavy wiring Their positions can be determined before the work is commenced, and even if the building is not actually wired at the time, suitable ducts should be provided in the walls, with outlets at appropriate points, to enable the wiring to be done at minimum cost and without damage to walls and floors. It will be found that a very few of such ducts will suffice to give access to every story at trifling cost. The main thing is to provide for the vertical runs of cable from floor to floor—the rest is easy. Much damage to floors can be avoided by the simple expedient of screwing instead of nailing one or more of the floor boards lying near the centre of the room or corridor. These facilities b provided, it is surprising how much wiring be done without disturbance to decorations,

Under the head of movable appliances radiators, suction cleaners, irons, fans, kett standard lamps, and a host of minor accesso With the possible exception of the first nam none of these requires heavy conducto even a three-kilowatt radiator at the us pressures needs nothing larger than 7/22 S.W whilst the smallest conductor permissible lighting circuits will readily carry any of others. To supply devices of this class, at le two wall sockets should be fixed in each ro Here, again, vertical ducts from basement roof are necessary, these ducts also carrying cables for lighting purposes, bells and t phones; but, as the sockets should be fixed the skirting boards, no further provision t the ducts and the screwed floorboards need made for them.

East Window: Church at Anglesey.
Designed by MR. J. CLEMENT BELL.

important point may be mentioned in tion with the use of electric radiators. these are used there is no necessity what- r coal fires and chimneys in bedrooms or n small offices. Hence a very material ny in building work can be made—suffi- n fact, to cover not only the cost of wiring ilding throughout, but also to pay for no art of the electrical apparatus installed. ating ducts, of course, should be provided; ese can be included in the thickness of the nd the abolition of chimney breasts and lpieces increases the useful floor area of the It is not yet generally realised that, in f the supposedly high cost of heating with city, it is not an uneconomical proposition when properly carried out, if due allowance is made for the value of the cleanliness, saving in labour, longer life of decorations, and unrivalled convenience resulting from its adoption.

A point which calls for mention is the provision of proper accommodation for main switches and fuses, meters, and distribution boards. Suitable positions for the latter can readily be foreseen, and recesses should be provided so that they can be sunk flush with the surface of the wall, in line with the ducts previously mentioned. Under the usual conditions, when electrical work is carried out as an afterthought in a building already completely finished and plastered, the cost of sinking the boards, &c., into the walls is prohibitive, and the consequence is that various items of the installation are obtrusively prominent and unsightly excrescences.

The subject of this article has by no means been exhausted; indeed, the writer has barely touched the fringe of it, but it is hoped that the important position that electricity occupies in an up-to-date building and the urgent necessity for making provision for its use *ab initio* may be more fully realised by the architect, with the result that under his instructions the builder will be enabled to provide for its economical installation and the electrical contractor will be brought on the job at the right time, to find that "cutting away and making good" is reduced to the minimum and that his work is already half done.

HOT-WATER SUPPLIES AND HEATING.—I.

following is the first of a series of rticles, by a hot-water engineer, dealing simple systems of supply—boilers and ct methods of heating, combined heat- ot-water supply systems, and central g—treated in a practical manner:—

Hot-Water Supplies.

Englishman is nothing if he is not, we say as a mild form of expression, vative! Little progress has been made the right lines; and although many s and appliances are now on the market, s which will lead to great improvements domestic and other supplies, their adop- s very slow indeed. He is taught at to say that the best steel comes from ld, and that the best of everything produced in some English town. But travels he gets the right perspective. hat we have not the appliances on the t: many appliances by British firms , if applied to the production of hot regulation of supplies, etc., can result othing but improved conditions and ncy of the heating apparatus. Mr. . Wingfield, Ph.D., M.I.E.E., in a read at the sessional meeting of the ute of Heating and Ventilating En- s on January 12, 1923, on "Automatic ation in Heating Installations" (and enting on a paper read by Mr. Herbert in 1912) stated: "I am sorry to say great deal of what Mr. Jones said years ago as to the scanty attention bject of automatic control has received country is even now only too true." hstanding the fact that in the U.S.A. a single heating plant is installed t some sort of automatic regulation, tic heat and temperature control has made any progress in this country. Vingfield stated further that, having requent opportunity to discuss the with consulting engineers and con- , he was invariably met by some emark as "Doubtless such regulation nice, but our clients or customers (as se may be) would never go to the involved"; or "Yes! we should like ose it, but there are so many in for ," etc. The writer goes on to say believes the fault lies chiefly with the r and contractor, who always prefer of least resistance, but that if they e convinced of the advantages obtained ould be better prepared to popularise ic control. Yet it is an easy matter e the added convenience of automatic improved conditions of comfort, and ial saving in working cost which will ustify the necessary initial outlay of d other units of an up-to-date instal-

is a deal of truth in the assertion of rican lady who, in the *Times*, stated all our love of hot water we were e of producing it for domestic use. average medium-sized house, both in and in the country, the hot-water supply is totally dependent on a boiler in the kitchen range which, even at its best and most extravagantly nourished moments, cannot supply a large family with a succession of hot baths.

The chief cause of this condition is that the small back boiler has been expected to do the impossible. The power of a small fire back boiler is very limited: the prevailing mistaken idea has been that such a boiler uses waste heat. The amount of waste heat absorbed is very limited, and where such a boiler exists extra fuel must be put on to supply the British thermal units which are racing away through the circulating pipes on their way to the hot store vessel. Indeed, with such a boiler, waste occurs by heat escaping into the mass of iron and brickwork, flues, etc., when fired simply for heating water, and when no cooking, etc., is needed.

War Memorial Window, South Transept, High Pavement Chapel, Nottingham.
Designed by Mr. J. Clement Bell.

For economical running it is gradually becoming recognised that the independent boiler, whether heated by solid fuel or by gas, is often more economical as a proposition for heating water for domestic purposes, even for small properties. To meet this demand there are many small boilers now on the market which are designed to give a maximum heating area exposed to the fire, for conveying the heat to the water and at the same time, by coloured mica doors and plated fittings, give a certain aspect of comfort, suitable for kitchen or living room of small properties. Many builders, and even architects, have very little knowledge of the modern requirements of hot-water and heating apparatus: to give a working knowledge it will be necessary to make a short survey on the systems in vogue.

The Tank System.

One great cause of the failure of the hot-water supply apparatus, as pointed out and observed by many, including the American visitor, was the indiscriminate adoption of the "tank system." For ten, twenty, and thirty years back thousands of two, three and four-story buildings were fitted with this apparatus. Space will not permit a full description of all its failings, but briefly the hot store is necessarily fixed above the highest fitting. This entails that the main circulating pipes, "flow" and "return," must run the whole height, often including long horizontal runs, from the basement to the hot store, usually in the roof. Whatever heat from the little back boiler is imparted to the water, it is lost to an appreciable degree on the way; and, further, the tank is in a cold situation, thus assisting in the general loss. If by chance, or by covering the circulating pipes and tank with non-heat-conducting material, real hot water exists in the tank, it cannot be drawn off without being diluted with cold. A glance at Fig. 1 will show this. It was not realised until comparatively recently that when a hot "draw-off" tap is opened all water in the apparatus will commence to flow by the most convenient course to the open tap. The direction of the arrows shows that the hot water cannot be drawn off without being diluted with water from the colder parts of the system when the tap is open. This condition is not peculiar to tank systems, and may occur in other types if incorrect connections are made. Fig. 2 shows a modified type of tank system with the same disadvantages, except that the tank is in a warmer position and the circulation a little shorter. If the draw-off pipes were arranged as indicated by the "dash" lines, then it is very similar in principle to the cylinder system, except that a rectangular tank is used in place of the cylinder.

The Cylinder System.

The cylinder system has many advantages over the tank system; all draw-offs are, or should be, taken from off, or near, the crown of the cylinder. This provision en-

sures that only the hottest water, which naturally is near the crown of the cylinder, can be drawn off. In the event of the cold water from any cause being cut off, the cylinder and boiler cannot be inadvertently emptied, with the consequent risk of fracturing the boiler. The cylinder is fixed near the boiler. This ensures a minimum run of main circulating pipes; the cylinder is in a warm situation—both factors reduce loss of valuable B.T. units from the stored water. In Fig. 3 a typical apparatus for a small villa is shown, with a run of pipes marked on the drawing. On such a small scheme, and where the fittings are conveniently grouped in a position near to the cylinder, the secondary flow and return to the fittings is hardly necessary. The object of the secondary circulation is to provide good hot water right up to the draw-off. If the pipes to these draw-offs are taken as a single line, the stagnant water in the pipes has to be drawn off before hot water can be obtained. On all secondary circulations the pipes must be so inclined that the circulation is assisted, and that all air given off can automatically escape. The expansion pipe is taken off from the highest point, forming also a natural air vent. The drain cock, safety valve, and the fullway valve on the feed pipe are essential features for a properly equipped apparatus. It is often not realised that the outflow at the taps is dependent upon the power of the feed pipe, *i.e.*, the height of cold feed tank and the diameter of the pipe. For this reason the feed pipe must be large enough to supply any number of hot taps open simultaneously. The minimum size would be one inch. The diameter of the primary circulating pipes is determined by the size of the apparatus; for a small villa type in a hard-water district, 1¼ in. is the minimum diameter, and 1 in. in a soft water district. Secondary circulations, towel rails and coils, as shown, all entail extra work on the boiler, and in fixing these it is essential to provide sufficient boiler power (*i.e.*, area of boiler exposed to heat of fire) to cope with this extra duty. Too much stress cannot be laid on this point. In the past, one of the most usual mistakes made in hot-water fitting has been to provide

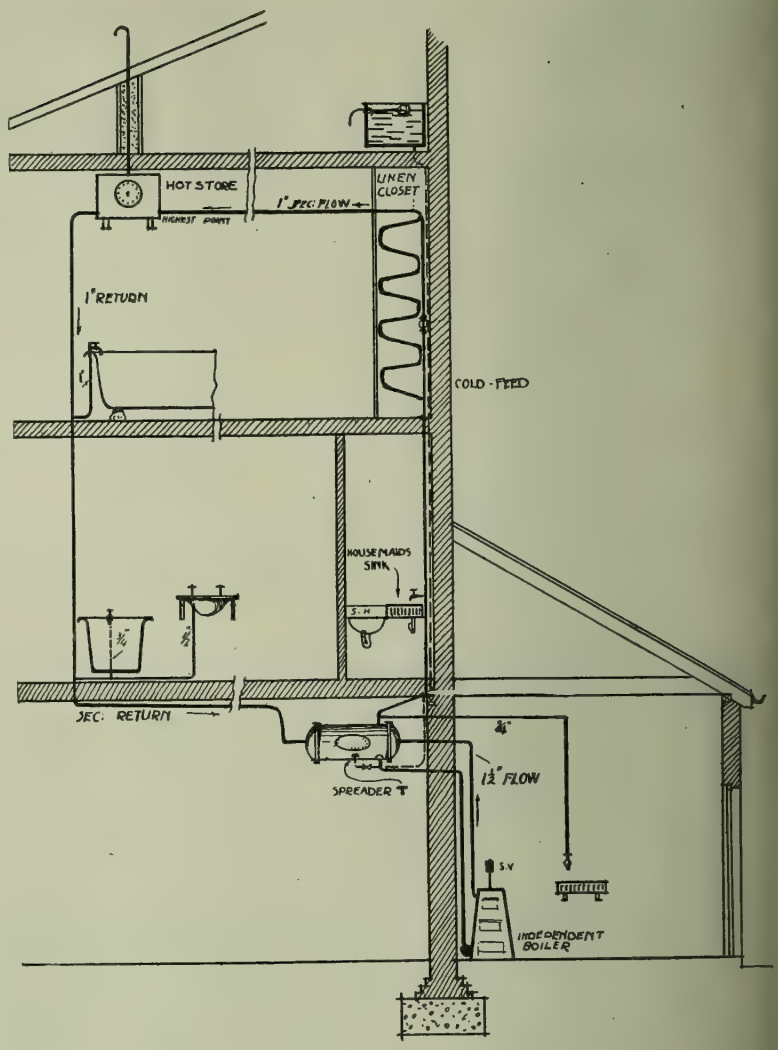

FIG. 4.

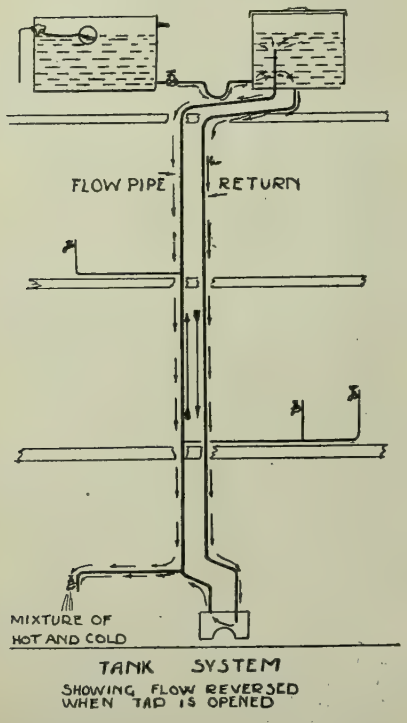

FIG. 1.

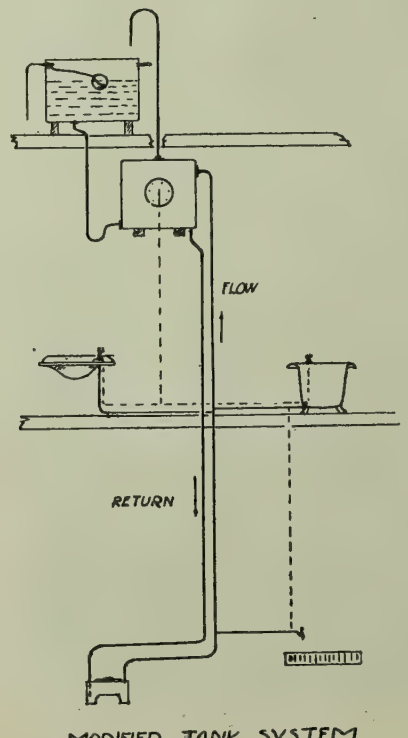

FIG. 2.

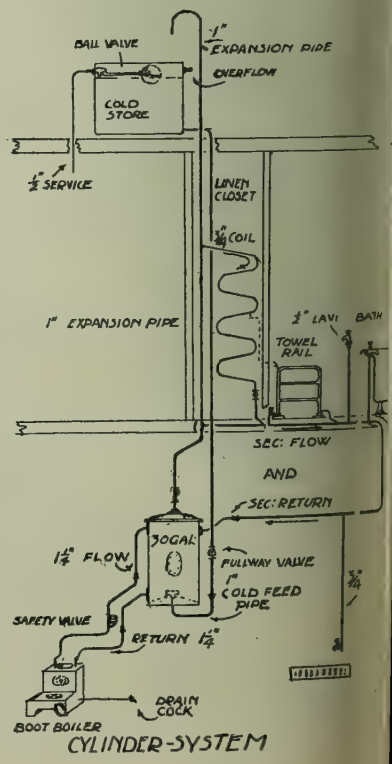

FIG. 3.

t-store vessel of too large a capacity in ortion to the power of the boiler, on the mistaken assumption that a large store el will give a big volume of hot water. domestic purposes a small volume of hot water is much more satisfactory a large volume of luke-warm water. very hot water can always be diluted n to bathing requirements, and good hot r is essential for dish washing. The most general types of boiler fixed at the of a kitchen range are the "Block er," with arched flue, sometimes known ne saddle boiler, and the "Boot Boiler, arched flue. Of the two the latter natur- is more efficient as it presents a larger to the heat of the fire; but, as before d, the independent boiler is gradually ing favour.

ne following table is offered as a rough e to determine hot store in relation to h of "fire back" cooking range boilers:

h of Fire.	Block Boiler with Arched Flue.	Boot Boiler with Arched Flue.
in.	20 galls.	.. 25 galls.
„	25 „	.. 30 „
„	30 „	.. 35 „
„	35 „	.. 40–45 „
„	45 „	. 50 „

has previously been asserted that the position for the cylinder is near the r. In many small villas the cylinder is l in the bathroom as the most convenient position. There is not much objection to this practice, providing that the cylinder is immediately over, or adjacent to, the bathroom, thus giving a comparatively short run of the main circulation. The advantages claimed for this practice are: the cylinder keeps the bathroom warm, and the top portion of the enclosure can be used as an airing cupboard for linen. Against these advantages it should be stated that from a hygienic standpoint the bathroom is not an ideal place for storage. A good deal of steam is given off during bathing and the lower half of the encasement forms a trap for dirt which cannot easily be cleaned out. Further, it is difficult to form a secondary circulation if needed. To ensure that the hottest water only can be drawn off, the secondary return should not rejoin the cylinder at a point lower than about 6 in. from the crown. If connected lower, water from the cool parts of the apparatus would mix with the hot water when a draw-off is opened, in a similar way to that described in Fig 1 of the "tank system." To take the secondary flow from the expansion pipe and drop to the floor to again rise to the proper point of connection would be impracticable as a dip of about 3 ft. would be formed in the circulation. This would, under the given circumstances, stop any natural circulation. If the cylinder must be on the upper floor and a natural circulating "head" cannot be obtained, the only way out of the difficulty would be to connect to a lower point, generally the primary return, and fix in a check valve, that known as the "Feather-weight" non-return, to prevent the cooler water escaping when a hot tap is opened. Many existing faulty systems can be improved by fixing this valve at a suitable point. To provide heat for the bathroom, a small radiator or a towel rail should be fixed; to the linen closet a small circulation is zig-zagged on the back wall as shown.

The Combined Cylinder-Tank System.

The cylinder system has one fault on large installations which does not exist to the same extent on the tank system. Distant fittings, high up on the installation, often get a poor outflow of water. To improve this condition a tank, which is virtually an enlargement of the secondary circulation, is fixed over the affected fitting, thus giving a direct "head" of water. As this tank is a part of the hot store it is essential that the boiler should be powerful enough to do this extra work. Such a scheme is shown in diagrammatic form. The cylinder may, of course, be fixed in a vertical position if the head room permits. When fixed as shown it is essential that a "T" piece should be screwed on the end of the feed pipe inside the cylinder, to prevent the cold water, by its entering velocity, boring a way through the body of hot water contained in the cylinder, escaping with the hot water when a tap is opened. It is a distinct advantage to "lag" the hot-store vessels to prevent loss of heat by radiation.

CARCASSING MODERN BUILDINGS WITH GAS PIPES.

By A GAS EXPERT.

the years which immediately preceded a steadily increasing number of archi- and builders were making it their prac- to carcass, as a matter of course, with pipes the residences, shops, offices, etc., h they were erecting. In many cases work was carried out by, or in conjunc- with, the local gas undertaking; but quite uently the latter was not consulted in the ter, with the result that the pipe-runs were etimes limited to certain points which the itects or builders considered necessary, which did not cover all probable uses of ; and sometimes pipes were run which e not large enough for the ultimate needs he subsequent occupiers.

rom 1914 to 1918 normal building ations were practically suspended, and k was principally confined to the erection premises for purposes connected with the , including many factories of various s. Comparatively few residences were t, though many of those already in exist- underwent serious structural alterations. outstanding merits of the use of gas as el for various purposes became almost ersally recognised in connection with the buildings above mentioned, but perhaps e than anything else the adaptation of ting buildings brought home to architects, ders, property owners, and Government ials the remarkable developments which taken place in the application of gas to ous purposes and processes, and its adapt- ty to the changes in circumstances which taken place regarding the buildings in tion.

as proved the only practical solution of problems which arose in these recon- ted buildings regarding cooking, heating, hot-water supply. But when the installa- of the necessary gas apparatus was under ideration it was discovered in all too y instances that either the gas pipes h already existed were hopelessly inade- e to supply the premises as altered, or their runs were limited to one or two ts only, which, for all the value they were, might as well never have been run at all. There is no doubt whatever that experiences such as these, coupled with the knowledge which was acquired by all classes of people regarding the services which gas could render to the community in general and the individual in particular, led to a considerable change in the outlook of those who were destined to deal with the general building operations on their gradual resumption after the war.

Piping Systems since the War.

In spite, however, of all past experience and the present popularity of the use of gas as a fuel, there are still occasional cases where premises of various kinds are erected without suitable and, indeed, necessary gas appliances being already installed, and sometimes—though still less frequently—without even an adequate system of gas piping being run during building operations, when such work can be done most conveniently, expeditiously, and cheaply. It is obvious that when gas pipes are thus installed the need for further disturbance of the building (with the consequent unavoidable damage to decorations) is obviated; moreover, the premises are rendered more valuable, more attractive, and indeed more habitable, to the prospective occupier. It will be noticed that the words "an adequate system of gas piping" are used, and the purpose of this article is to impress upon architects, builders, and others concerned with the erection of buildings the absolute necessity not only of piping premises for gas, but the advantage when preparing their plans of consulting the local gas undertaking as to the sizes of pipes and points which should be run, having in view the modern developments in the applications of gas and in gas apparatus.

It is not too much to state that not only is no modern building of any type or size complete without a gas service from the main being run into the premises and some form of gas-piping system being installed, but that all residences should have a complete gas-piping system run throughout, to every point where gas appliances could be needed for the immediate use of the incoming tenant, or ready for their subsequent installation in the future.

The use of gas appliances is still rapidly extending, their design and efficiency are constantly improving, and the price of gas is being rapidly reduced. All these factors go to justify the above claim, but a few further facts may be given.

There is an ever-present and persistent demand by the public for gas in one or many of its applications for use in buildings of all kinds. The purposes for which gas may be economically used are constantly increasing. Every building, therefore, should be prepared for future developments as well as for present needs.

Gas is hygienic in use, and it is the only economic and commercially sound solution of the smoke abatement and domestic service problems.

Gas is at the service of mankind, and while it may be suggested that some striking improvement and/or cheapening of one of the other existing sources of heat may occur in the future, is it not obvious that in case this does not happen preparations should be made for the use of something that is known to fulfil all the desired purposes? Moreover, it may confidently be assumed that the gas industry is not standing still, and that if improvements in appliances and reductions in price are achieved by its competitors, so assuredly will the same progress be made as regards gas.

The Cost of Installing Gas Pipes during Building.

The expense involved in installing a complete gas-piping system to cover all present and possible future needs is infinitesimal compared with its immediate and prospective future value; moreover, it is a mere fraction of the total cost of any building in which it is to be included. A comprehensive gas-piping system is very unlikely to cost more than

1 per cent. of the total money expended in the erection of any building; indeed, it usually costs less than this figure.

A gas-piping system should be looked upon as an investment, not an expense; first, from the point of view of the builder or seller of the house, because it immediately becomes more saleable and is worth a higher figure; second, from the standpoint of the occupier, who, when paying for it in an inclusive purchase price, certainly gets it at a lower figure than he would need to pay for running the necessary pipes after the building is completed, in order to supply the gas apparatus which he would wish to install.

Further advantages gained by the running of gas pipes while buildings are being erected are the prevention of subsequent discomfort and disturbance, and of the additional expense which is inevitably connected with making good damage to the structure and decorations. Moreover, even if all the points which are run are not immediately required by the prospective occupier they are ready for use at a later date, when apparatus can be connected to them with a minimum amount of disturbance at a minimum cost.

Gas Cooking.

It is perhaps permissible here to make short reference to some of the many possible uses of gas. The gas cooker is now almost universally installed or provision made for it in new buildings, and if this is not done the first tenant or purchaser is usually dissatisfied. Practically every large gas undertaking, however, has at times met with cases where houses have—very unwisely—been erected with no provision for gas, and inevitably the demand has arisen from the occupier for at least a gas cooker, with the result of additional cost of installation work and disturbance to the building and decorations. As an example, it may be mentioned that a large gas undertaking is at the present moment dealing with a number of requests from the tenants of two local authorities for the installation of gas cookers where none has been fitted under the housing scheme adopted by these authorities, and, incidentally, many applications from the tenants of another housing authority for gas for lighting, where electric light has been installed. In neither of these cases are pipes ready for the requisite purpose. Another somewhat similar case may be quoted. A large company a year or two ago erected some houses on its estate with no proper system of gas pipes installed. The superintendent who handled the sale of the houses subsequently found himself inundated with inquiries as to where were the pipes for gas water-heating, gas coppers, or gas fires, and owing to their absence he found it impossible to dispose of the houses. The gas undertaking was approached, and it was found necessary to go to the expense and trouble of pulling up boards, etc., to run the pipes which could and should have been run at a very low cost during the erection. Needless to say, arrangements were made, in connection with the extension of this estate, for the gas undertaking to run a complete system of supply pipes in the houses while they were being erected.

The above are cases of which full particulars can be provided to anyone interested in housing problems, and they are by no means unique.

Water Heating.

The use of gas for water heating as a complement to gas cooking has increased enormously in the past decade, and appliances either of the instantaneous type, such as the geyser, or in the form of gas water-heater and cylinder combined, to supply hot water to sink, bath, and basin, have been installed in thousands, even for houses constructed to be occupied by tenants of the working class. It is, therefore, obvious that if gas can be installed for water heating with advantage in working-class property—provided that the hot-water system and pipe runs in the houses have been designed for its use—its use should be anticipated and prepared for when erecting houses of a larger and more expensive type.

Gas Coppers.

The gas copper, which is now very extensively installed in residences of all kinds, has proved a boon to the housewife in abolishing the worst terrors of washing day. At a very low fuel cost it will deal with the week's wash without the labour, dust, and dirt which inevitably accompany the use of the old-fashioned solid-fuel coppers.

Refuse Destruction.

A field for the use of gas which has not yet received all the attention which it deserves is its application to the destruction of household refuse. Medical Officers of Health attached to large towns have for some years past been advocating the destruction of refuse by burning it in the household itself, instead of collecting it in vans which have to be loaded in the streets, through which it has to be carted to the destructor. However carefully it is tipped into these vans, that is obviously not a hygienic process, especially in windy weather. Moreover, these guardians of the public health have rightly drawn attention to the drawbacks connected with the use of the dustbin. In several large London boroughs leaflets have recently been sent to the householders asking them to burn their own household refuse as far as possible, and so help to secure—

(1) The better health of the community in general.

(2) The better health and comfort of their own families.

(3) The freedom from smell from the dustbin and the lack of flies arising therefrom.

(4) A reduction in the cost of refuse collection, which must subsequently reduce the amount which they pay in the form of rates.

The domestic gas-fired refuse destructor known as the "Burnall"—which is not costly and is let out on hire by some gas undertakings—has solved the problem of how to burn domestic refuse both conveniently and economically.

Gas Fires and Building Costs.

Gas fires are becoming so popular on account of their many advantages that their installation should be contemplated in all modern buildings, and pipes run to every fireplace accordingly; but in recent years a development has taken place in connection with gas heating to which reference is necessary when dealing with the question of building construction. The "economy" gas-fire flue is the development referred to, and if gas fires of the type known as "built-in with mantel register" are installed a great saving may be effected in building cost, and, what is also of great importance, more floor space made available on the same ground area. This economic principle has gone far beyond the experimental stage, and thousands of houses have been and are being erected containing such installations, with most, or all, of the usual coal-fire flues, with their large area, resultant chimney breasts, and heavy structural costs eliminated.

A further point of great importance is the fact that, the flue being constructed within the thickness of the wall, the face of the wall inside as well as out is flat, and this straight surface, without breaks or angles, saves many hours of the plasterers' time. It is perhaps not necessary to remind architects and builders that one of the difficulties connected with modern building is the lack of sufficient plasterers. In a housing scheme at Liverpool more than 1,000 houses have been built with two or three "built-in" gas fires in each, and in the London County Council's Becontree Estate some thousands of similar gas fires have been fitted. These are in houses of a small type for people of moderate means, and as it has been proved to be possible for such tenants to afford and enjoy the advantages which accompany the use of a gas—its cleanliness, availability, and labour-trouble-saving qualities—it will readily realised that the principle still more app and has spread to residences of a larger superior type.

The economy which may be effected building cost by the substitution of gas flues for coal-fire flues has in some cases b carried too far, and their construction has been treated with proper respect.

It must still be remembered that they and must always be regarded as, flues, that from the point where the gas fire pa its products of combustion into them, onwa throughout their entire length, they should constructed in the same manner as coal flues, and, to ensure freedom from do draught, should discharge at the highest p of the roof, as is usual with a coal-fire f The economy to which reference has b made is effected by the reduction in the a of the flues, its resultant effect on the bu ing construction, and the provision of a tional floor space on the same ground a The value of these advantages is so defi and substantial that there is neither need justification for taking risks.

There has been a tendency here and t to construct gas-fire "economy" flues sizes which are inadequate to deal with products of combustion from the fires wh discharge into them, and they have also b permitted to terminate in a position wher satisfactory pull and ventilating effect car be ensured in all weathers. Indeed, writer has actually met with cases wher piece of pipe has simply been stuck strai through the wall behind the gas fire carried up to the ceiling level of the r and then taken out to the open air. C have also occurred where gas fires have b fitted with their flue outlets discharging cavity walls with no proper flues constru therein. Such work is unsatisfactory, leads to the necessity of subsequent re struction work being carried out, and t additional expense and trouble are incurre

The Ministry of Health made the follow recommendations on "built-in" gas economy flues in its official organ, *Hous* dated June 21, 1920:—"The cavity o hollow wall should not be used as a flue gas fires unless a suitable shaft is prop constructed therein. If smoothly finished, size of the flue for a gas fire need not ex 20 in. in area, but should not be less t 18 in. in area, nor less than 3 in. wide i narrowest part. All flues for gas fires sh discharge into the outer air at the top of building, so that there may be no dange back draught into any room. Additional f of about 20 in. in area might with advan be provided as ventilating flues adjoining flues, with inlet openings near the ceiling.

This information concerned the small fires which are being installed in connec with housing schemes carried out by l authorities, but below are quoted the m mum flue areas and the sizes suggested all gas fires from the smallest to largest:—

Gas Fires. *Radiants.*	*Fire Front.*	*Minimum Flue Areas.*	*Size of suggest*
5 ..	8″ ..	18 sq. ins. ..	(4½″×4
7 ..	10″ ..	18 ,, ..	(4½″×4
10 ..	14″ ..	27 ,, ..	(4½″×9
12 ..	17″ ..	36 ,, ..	(4½″×9
14 ..	21″ ..	40 ,, ..	(4½″×9

The interior depth of any such flue a completion should be at least 3 in.—preferably 4½ in.—at its narrowest po Each gas fire should have its own flue. throughout the entire length it should no connected with or run into the flue of other fire or fires. It should be constru in brick or concrete block; parging is necessary, but the interior should be c fully trowelled.

The gas fire should not discharge im diately into the flue shaft, but an opening full width of the fire outlet should be gra ally (not abruptly) gathered over in the s

anner as would be done in the case of a
al fire. In effect, a products chamber
ould be constructed above the gas fire outlet
rresponding with the smoke chamber
ich is always constructed above a coal
e. There will then be no check to the free
ssage of the products of combustion into the
e shaft proper, and the full ventilating
ect will be ensured.
Exceptional cases may arise in which some
parture from the standard methods set out
rein may be permissible, but no deviation
ould be made from the general principle
thout consulting some competent authority
the matter.

Central Heating.

In recent years an extension of the prin-
le of installing central-heating systems in
ge houses and other buildings has occa-
nally been advocated, but without any very
terial results. There are various reasons
the comparatve unpopularity of such
tems in this country, among which may be
oted :—
. Their heavy installation and maintenance
ts compared with gas heating by separately
tained gas-fire or gas-radiator units.
. The love of the British people for the
erful appearance and hygienic ventilating
ct of an open radiant type of heat, such as
t provided by the coal or the modern gas
. In the dull gloomy days of autumn and
ter a hot-water or steam radiator is a
erless companion compared with the glow
a gas fire
. The climatic conditions in this country,
ich call for some ever-ready, no-work-
king form of heating at practically any
e of the year, as it is not unknown for a
to be required in one or more rooms (but
throughout the house) for an hour or so.
n on a June, July or August day. It is,
course, impossible to obtain such local and
rmittent heat by any central-heating
tem. This statement is proved by the fact
t at the present moment some premises
ch have a centrally heated system installed
having gas economy flues constructed
in the walls, and "built-in" gas fires
alled for the comfort of the occupants on
many occasions during which heat from
central system is not economically obtain-

hile on the subject of central heating,
ever, it is also worth mentioning that
re such systems are installed gas can still
utilised as the source of heat. Gas is now
easingly being used for heating central
ems, large gas-fired hot-water or steam
rs having been designed for the purpose.
efore, even when central heating may be
r consideration for a building which is
t to be erected, gas will probably be
ired either for the boiler or boilers, or
some auxiliary form of intermittent heat-
by gas fires as outlined above.

Gas Lighting.

We occasionally meets people who seem to
the opinion that gas need not seriously
considered when lighting problems are
r discussion. While there are, of course,
in buildings in which gas lighting would
nlikely to be installed, it would be very
rom true to state that it cannot play an
omical and satisfactory part in a very
number of buildings of all kinds. For inside and outside shop lighting, for factory lighting, and many classes of residences, it is still being extensively installed. Modern gas fittings are now obtainable of good design, and there are many other improvements, such as super-heated cluster burners, distant lighting systems, and heat-resisting globes, which reduce the cost of maintenance. Therefore lighting points should generally be included when carcassing premises for gas heating, cooking, etc., and while the other work is being carried out they will only add a fraction to the total cost of the whole piping system.

Factory and other Premises.

It is practically impossible nowadays to find a manufacturer who does not use gas for some purpose on his premises. It may be for any one or all of the domestic uses already outlined, and in addition to these he will probably use gas for power purposes and for producing the heat required to carry out some trade process or processes.

Gas in Industry.

It is interesting to note that there are about three thousand trades which are known to use gas for manufacturing purposes, and that there is an average of seven gas-fired processes carried out in each one of these trades; moreover, this already large and comprehensive list of processes to which gas can be, and is being, applied is being steadily increased.

As an illustration of the need for running gas supplies in any factory which is in the course of erection it is, perhaps, not out of place to give a recent case which occurred on the area of supply of a large gas undertaking. A factory was being erected in a new roadway which ran through an area which had been demolished, and the building was about to be occupied by a firm of manufacturers. On the representative of the gas undertaking calling upon the builder, and subsequently the manager of the firm in question, he was advised that no gas would be required, because the firm were using steam for all their processes at the factory from which they were about to remove. The gas representative pointed out that if no arrangement were made to have a main run down the road in question, and no service pipe or carcass pipes were installed in the premises, it would probably lead to great inconvenience and extra expense to the firm at a later date, especially as the roadway was to be laid very solidly with a considerable depth of concrete. He explained also that modern applications of gas had proved that many of the purposes for which the central steam boiler was being used could more satisfactorily be carried out locally by separate gas-fired units, and that even supposing that a fairly large steam installation were also required such work could now be carried out by a modern gas-fired steam boiler of the type which has recently been installed by the proprietors of the *Times* for raising the steam required in their processes. Further consideration was given to the matter, with the result that the main and service were laid and pipes installed for a suitable gas installation. It may be mentioned that the firm in question may have been further influenced by the fact that some of their competitors had already discovered the economic possibilities attached to the use of gas.

Gas for Canteen Work.

Another point to remember when the erection of factory premises is under consideration is that in almost every factory nowadays (and in many offices) some kind of welfare work is carried on, the scope of which frequently includes the running of a luncheon-room or workers' canteen. In such cases some form of gas-cooking apparatus is always required, and, of course, the necessary pipes to supply it

The Provision of Adequate Pipe Runs.

It is probable that the statements and information contained herein may have satisfied any interested reader that it is a commercially sound proposition to install a system of gas piping in any modern building. But he may then wish to know what is the best method of procedure when considering the erection of premises, and whether there is any formula obtainable which sets out the sizes and runs of the pipes which will be required for various buildings. It is clearly impossible in an article such as this to set out any such definite simple formula, but it must be remembered that gas engineers have recently been giving great consideration to the provision of mains and services of adequate sizes, and they are naturally in a position to know the quantity of gas which these will deliver. They have also given considerable attention to the planning of comprehensive systems of gas piping for all classes of buildings, and practically every gas undertaking is prepared to give the services of representatives who are qualified to offer advice and supply information free of charge on the subject of running suitable pipes to—and throughout—any building which may be under consideration.

Whenever it has been decided to carcass premises for gas there is one definite principle which should be followed in every case, and that is that pipes should be run of a size sufficiently large to supply any possible present or future apparatus which may be required, in any room or part of the building, with a safety margin in hand in every case, in order to allow for a possible loss of pressure in any part of the system through any local stoppage that may occur after the pipes have been in use for a number of years.

For the information of those dealing with houses of a small type, the British Commercial Gas Association has prepared and published a pamphlet entitled "Standard Instructions for Preparation of Specifications for Gas Piping," free copies of which can be obtained from the Secretary.

Beyond the facts already given to show the extent to which gas is used to-day and to confirm the truth of the statement that the number of gas installations is steadily increasing, it is sufficient to say that in Great Britain in 1922 there were 4,900,000 gas cookers and grillers in use; and 67,000 new installations of gas stoves were made by one London gas company alone. Nearly 20,000,000 tons of coal are carbonised annually, producing 258 thousand million cubic feet of gas.

Finally, when it is known that over eight million houses and factories use gas, and that the demand for gas appliances steadily continues, it must be realised that in planning any new building whatsoever the consideration of gas facilities is absolutely fundamental.

VENTILATION.

RING the last few decades some important
iments in ventilation have been followed
less important enquiries into their practi-
sults, and, despite the very definite state-
ts that have been made in praise or blame,
ost certain thing that can be said about
ience of ventilation applied to buildings is
pinions differ.
troversy may not be quite so public, nor
r so violent, as when the new Sessions House was first erected at the Old Bailey and crowds of students flocked to see its labyrinth of air ducts, its air washing and heating chambers, air filters and the machinery for setting up currents to the various parts of the great and complex building; but still different authorities take kindly to one or other of the rival principles of ventilation with absolute confidence in their own convictions. Natural and mechanical ventilation have each their devotees, and if, at the moment, the advocates of natural ventilation are enjoying the spectacle of their rivals suffering under the lash of certain eminent scientists, the Mechanical Party is still in active practice, and such an important building as the Council Chamber of the New County Hall has been fitted with appliances for mechanical ventilation of the most complex description. The facetious reports which appear in the daily press concerning the tortures of long suffering

Members of Parliament or of criminal judges slowly suffocated at their posts in chambers where a mechanical system has been installed, have, presumably, in some instances, some small substratum of fact, for even a judge should be capable of stating whether he can breathe in comfort or otherwise just as well as any ventilation expert can decide the point for him.
